Beyond the bead-based periodization, temporal distinctions are hazy, as identification of the Early Period as a clear-cut behavioral or cultural shift at a specific point in time is less obvious. In the literature from the mainland of the California Bight, some authors identify change in patterns of settlement, specifically a shift away from a practice of relocating the entire residential settlement multiple times throughout the year (i.e., a "residentially mobile" pattern), to a pattern the entails moving the residential base only a few times a year (i.e., a "logistically mobile" pattern). For example, Glassow (1990, 1996) saw this shift happening at approximately 8500 years ago for the broader region (prior to the dates he uses for the end of the Milling Stone Horizon) while research from the far northern end of the California Bight puts this shift much later, at approximately 3000 years ago (Lebow et al. 2006). Unfortunately, the differences in interpretation make it difficult to identify or define temporal periods for the region on the basis of cultural behavior alone.

Use of milling equipment persists through this period, though the form and variety of the manos and metates change (Gamble and King 1997), while mortars and pestles were "added to the milling repertoire" around 6000 years ago (Glassow et al. 2007:197). At CA-SBA-53 on the Goleta Slough, millingstones and mortars in roughly the

[3] By contrast, archaeologists in other parts of the state have abandoned this confusion in favor of chronologies based on a broader range of material culture anchored to absolute dates (Rosenthal 2011; Rosenthal et al. 2007) Either way, these names and boundaries are all somewhat arbitrary, imprecise, and/or artificial.

same proportions (and in greater numbers than in most any other excavated sites in the region) come from deposits dating to 5650-5050 BP (Harrison and Harrison 1966; Rick and Glassow 1999). Whether any of these things point to a change in diet is still an open question. Importantly, mortars are costly to make and signal an investment in processing technology much greater than the use of millingstones (Hale 2001, 2010). Such an investment was likely made to increase processing efficiency of pulpy nut meat such as acorns (Hale 2009). Glassow (1997) suggests that they could have been used to process bulrush and other estuarine resources, though millingstones would have offered similar efficiency in processing such things. It is certain, however, that the addition of mortars marks a socioeconomic shift that placed emphasis on intensive resource extraction and/or processing beyond that which could be accomplished using a basined millingstone. Perhaps this is the economic shift that identifies the onset of the Early Period. The extent to which this change in economy reflects change in the density and distribution of subsistence resources as a function of regional environmental change at the end of the Mid-Holocene warm period, or "Altithermal" (Glassow 1997; Rick and Glassow 1999; Glassow, Wilcoxon, and Erlandson 1988), along with a decline in marine productivity associated with warming sea-surface temperatures (Kennett et al. 2007) is an important but unresolved issue.

A broad range of evidence regarding subsistence diversification, increasing sedentism, status differentiation, ritual activity, rock art, and population growth have all been marshalled to suggest that the second half of this interval (after 4000 years ago, or what Lebow and Moratto call the "Late Early Period") contains some of the earliest evidence for the evolution of cultural complexity in the region (Glassow et al. 2007; Erlandson and Rick 2002), though dramatic, fundamental change did not happen until the end of the Middle Period and into the Late Period.

The Middle Period: 2500 – 800 BP

Glassow (1996: 22) suggests that the defining feature of this period is the elevated importance of fish and marine mammals in the subsistence budget. Appearance of the single-piece shell fishhook around 2900 BP, along with increasing importance of notched stone sinkers corroborates this and may have been essential to the intensification of the marine-based economy on the mainland as well as on the islands (Rick et al. 2002; Erlandson 1997b). Indeed, intertidal resources (namely shellfish) remained important to everyone living within walking distance of the coast. And though it seems clear that people in some places acquired more of their protein from large terrestrial and marine mammals during the Middle Period than did people in earlier periods (Lebow et al. 2007) shellfish was still the dominant source of protein throughout the region (Glassow 1992).

During this time, the old groundstone food processing slabs of the early and middle Holocene are mostly absent throughout the region, while mortars become more common, and with increasing effort invested in their production (Glassow 1996; Hale 2009). Whether or not this shift from millingstones to mortars points to the rising importance of the acorn to the subsistence economy, as it is thought to do elsewhere in California (Hale 2010; Basgall 1987), is a question that demands further attention. Answering it depends, in part, on establishing a solid understanding of the distribution of different kinds of oak trees in different parts of the region. For example, oak trees are rare, or entirely absent from the landscape within about 10 km of the coastline throughout the northern end of the California Bight (see Glassow 1996: 6). Where oak trees were scarce, mortars were either used for processing other things, or acorns were transported from considerable distance – a pattern well documented from other parts of California (Morgan 2007).

Land use patterns observed to the west, in the Vandenberg region (Lebow et al. 2006), suggest that these changes in resource use were accompanied by a shift in settlement patterns: though the shift to a logistical pattern of residence began around 3000 years ago, it was fully in place throughout the Middle Period. If the patterns observed from the compilation of radiocarbon dates, both from Vandenberg (Lebow et al. 2010; Lebow et al. 2011) and the

surrounding region (Glassow 1996) can be used to evaluate change in human population, then the Middle Period is the first episode of measurable and sustained demographic increase in the history of the region, increasing noticeably approximately 2800-1800 years ago, and then dramatically after that. Thereafter, life across the Channel on the Islands starts to change markedly: the number of settlements starts to increase and people start to live in those settlements for longer periods of time while commanding more rigid territories and controlling the natural resources within them; at the same time, the incidence of inter-personal violence increases while human health and stature start to decline (Kennett 2005; Lambert and Walker 1991; Lambert 1997, 2002; Walker 1989). Together, these things mark the beginning of a trend that continues into the Late Period where it intensifies dramatically. The extent to which these patterns obtained on the mainland and the adjacent interior, or how people in any given area were affected by the dramatic change on the Islands, are open questions.

The Late Period: 800 B.P. – European colonization (ca. A.D. 1780)

For most of this periodization, the exact starting and ending dates are mostly inconsequential, but the Late Period is different, in part because the bead-based chronology is more precise, the archaeological record is better preserved, change in that record is more pronounced, and because change in the cultural record seems to match dramatic change in well-dated, high-resolution paleo-environmental archives from the Santa Barbara Basin that are also reflected in written records from other parts of the world (Kennett and Kennett 2000; Kennett 2005; Raab and Larson 1997; Jones and Kennett 1999; Arnold, Colten, and Pletka 1997). Setting it at 800 B.P. follows King's (1990) bead-based chronology, and includes the period of dramatic environmental change (ca. 800-650 BP) along with its purported role in rapid Late Period cultural change. However, one could easily define this cultural period by everything that happens after that environmental change, as Arnold (1992) does, or alternatively by putting it at 1300 BP – the beginning of Lebow and Moratto's (2005) Late Middle Period – by which time many of the material hallmarks of Late Period cultural complexity (the sewn-plank canoe, the bow and arrow, exotic raw materials, intensive fishing, standardized *Olivella* shell beads, status differentiation, skeletal evidence for interpersonal violence, stable primary villages) were all in place, and the pace of cultural change began to increase (Kennett 2005).

Hale (2010) argues that the rate-limiting factors on cultural evolution are socioeconomic, rather than techno-environmental. Therefore, the archaeological signatures of culture change (namely, the types and uses of artifacts, including food remains) that appear to be more rapid during the Late Period are more important when viewed in the light of major socioeconomic shifts, rather than seeing them simply as a rapid accumulation of variability. More to the point, a time-limited strategy would actively resist change while an energy-limited strategy would actively pursue it, and would accumulate material representation in the archaeological record accordingly simply through technological improvements to make tools more efficient or specialized, and in specialized subsistence (Bettinger 1999). The causal relationship between the archaeologically visible increase in material diversity over shorter periods of time, and socioeconomic strategy (i.e., time- or energy-limited) on the one hand, or demographic increase on the other (see below), merits further investigation throughout the region (particularly at sites with rich artifact assemblages).

Since the mid-1980s an enormous body of literature has accumulated on the origins of cultural, social, and political complexity in the Santa Barbara Channel. Much of this has been dedicated to the Late Period and most of that has been done on the Islands. The archaeology of this is spectacular, and dovetails dramatically with the written accounts of European explorers, Mission colonists, and 20th century ethnographers. In addition to basic archaeological reconnaissance, there has been focused attention on understanding subsistence (e.g., Bernard 2004; Martin and Popper 2001), the context of shell bead money production (Arnold and Munns 1994), the production of tools (i.e., microlithic drills) used to manufacture that money (Arnold 1987, 2001), the differential access to exotic goods (Arnold and Graesch 2001), the presence of trade centers (Arnold 2001; Gamble 2008), the production and control of sea-worthy watercraft (Gamble 2002; Arnold 1995), and established patterns of exchange (Arnold 1995; Fauvelle 2011).

By 650 BP the full suite of attributes that early European chroniclers noticed of the Chumash were in place on the Islands: sedentary villages of permanent semi-subterranean architecture, high dietary diversity that also included prestige items like pelagic fish, a monetized market economy, specialized craft production, inter-village and island-mainland exchange networks, political control of natural resources, numerous forms of personal adornment, and an unequal distribution of wealth. Presumably, these things also index the social order documented of the Chumash, including elite offices, formal religious systems, hereditary power and prestige (i.e., the "Dynasty of Nobility"), a ranked social order, institutional inequality, and chiefly control (e.g., Blackburn 1976; Gamble 2008; Harrington 1942; Hollimon 2004; Johnson 1988).

3.4.1.2 Historic Context

The earliest European exploration of California was by sea approximately one generation following the Spanish conquest of the indigenous groups in what is now Mexico. In 1542, ships under the command of former conquistador Juan Rodríguez Cabrillo explored the coast perhaps as far north as Mendocino. The expedition spent time ashore on the mainland and islands of the Santa Barbara Channel, long enough to record various attributes of Chumash social and political life, and noted that the region along the mainland coast from approximately Point Mugu to Point Conception was heavily populated. That said, the Cabrillo expedition only report going ashore here to visit settlements at *Pueblo de las Canoas* (interpreted variously as either Ventura, Mugu, or Malibu Lagoon), *Pueblo de las Sardinas* (perhaps at Mission Creek near downtown Santa Barbara), and *Xexo* (likely Cojo Anchorage at Point Concepcion). Inhabitants from these settlements, as well as those at Dos Pueblos, Goleta Lagoon, and perhaps Carpinteria likely paddled out to encounter, and board, the European sailing vessels (Gamble 2008; McDaniel McDevitt 2013; Johnson 1982; Rindge 1985; Heizer 1972; Wagner 1928). The Cabrillo expedition also anchored and landed at various points on the islands, including on their return trip south, where Juan Rodríguez Cabrillo died under conflicting accounts, perhaps on San Miguel Island (Heizer 1972).

Spanish ships engaged in the Manila Galleon trade regularly sailed south along the California coast beginning in 1565. This resulted in a least two known instances of contact with indigenous groups in California. One instance occurred when Pedro de Unamuno entered Morro Bay in 1587 and traveled inland perhaps as far as what is now the city of San Luis Obispo and made claim to the land in the name of the King of Spain. Later, Sebastian Cermeño visited San Luis Obispo Bay in 1595 in a small boat following the loss of his ship further north at Point Reyes (Greenwood 1978). These voyages did little to strengthen the Spanish presence in the remote province of Alta California. In 1602, Sebastián Vizcaíno sailed north through the Santa Barbara channel long enough to grant one of the islands (and therefore the region) the name "Santa Barbara." While in the region the expedition encountered several Chumash who had come out by canoe to greet and inspect them (Wagner 1929). Vizcaíno's cosmographer, Jerónimo Martín Palacios, may have paid a return visit to the mainland long enough to comment on the size of the settlements and the quality of its natural resources, though this remains uncertain (Brown 1967).

Spanish Mission Period (1786–1834)

Following the earliest boat-based exploratory visits to the Santa Barbara Channel, and the subsequent, irregular, and largely undocumented contacts through the Manila Galleon trade, the Spanish Period in the California Bight began with the 1769 overland expedition led by Captain Gaspar de Portolá in an effort to establish a system of missions and fortifications in Alta California. The goal of the Portolá expedition was to establish a mission in Monterey, the second mission in Alta California following the mission in San Diego, and to reconnoiter the region for colonization.

Diaries from the Portolá expedition provide the most detailed accounts of the mainland around Santa Barbara, where they made elaborate descriptions of Chumash generosity, ceremony, performance, cuisine, village size, population, and even politics (Bolton 1967; Priestley 1937; D.E. Smith and Teggart 1909; Teggart 1909). Notably, the village names recorded by the Portolá expedition did not match those recorded by Cabrillo 227 years earlier, perhaps revealing something about the long term stability and tenure of village locations in the area, possibly associated (at least during the protohistoric era) with shifting socioeconomic interests and political allegiances (C.D. King 1978; Johnson 1982).

When the Portolá expedition traveled overland, heading north from Ventura in 1769, they were famously taken by what they witnessed in the vicinity of modern day Carpinteria: a large, prosperous bluff-top village next to a freshwater outlet (Carpinteria Creek) oriented substantially towards the sea. To the Spanish, the presence of several *tomol* sewn-plank canoes in various states of manufacture or repair seemed like a shipyard, and they dubbed the location *La Carpinteria* (Brown 2001). This was the village of *Mishopshno*, and over the years the Spanish estimated between 500 and 97 inhabitants, notably declining from A.D.1770 to 1796 (Gamble 2008; Brown 1967, 2001). An important feature of this location, as noted by Friar Crespí of the Portolá expedition, were the natural "springs" of asphaltum, which provided essential raw materials for (among other things) the waterproofing of ocean-going canoes (Brown 2001). As the expedition moved north from here, they would have had to circumvent a large lagoon or estuary occupying an area much larger than that represented by the Carpinteria Salt Marsh today. Beyond that, near the mouth of Toro Canyon they encountered the village of *Q'oloq'* (*Coloc*), which was considerably smaller than *Mishopshno*, before continuing up the coast. This area was later visited by Felipe de Goycoechea in 1796 while conducting a formal census of the California coast.

With the establishment of Mission San Luis Obispo (1772), Mission San Buenaventura (1782), the Presidio of Santa Barbara (1782), and later Mission Santa Barbara (1786), Mission La Purísima (1787), and Mission Santa Ynez (1804), life changed profoundly for the indigenous inhabitants of the region. The root cause of change was Spanish religious and political hegemony brought by the Franciscan missionaries and enforcement of their assumed authority by the Spanish military. Religious conversion, adoption of farming and ranching practices, forced labor, capital and corporal punishment, virulent exotic disease, and intermarriage with other groups also contributed to the rapid dissipation or modification of many aspects of traditional tribal culture. The effect of the early Spanish Period on the Native population was dramatic. By 1805, the vast majority of pre-existing Chumash villages had been abandoned as their inhabitants either relocated to the Mission districts to assimilate with communities there, or moved further inland to the periphery of traditional Chumash territory and beyond (McLendon and Johnson 1999; Byrd and DeArmond 2018; Byrd, DeArmond, and Engbring 2018).

The extent to which the armed Chumash resistance of 1824, and the subsequent response by both Spanish and Chumash (Sandos 1985) affected the lifeways, residences, and genealogical histories of people originally tied to the villages of *Mishopshno* and *Q'oloq'* – both of which are recorded in the baptismal records of Mission Santa Barbara (Johnson 1988) – is an ongoing and important avenue of research, perhaps answerable only through a combination of documentary records, oral history, and thoughtful, ongoing consultation and collaboration (Ranch 2012).

3.4.2 Relevant Plans, Policies, and Ordinances

3.4.2.1 Federal

Although there is no federal nexus for this project, the trail proposal was evaluated in consideration of National Register of Historic Places (NRHP) designation criteria and integrity requirements.

National Register of Historic Places

The National Register of Historic Places (NRHP) is the United States' official list of districts, sites, buildings, structures, and objects worthy of preservation. Overseen by the National Park Service, under the U.S. Department of the Interior, the NRHP was authorized under the National Historic Preservation Act, as amended. Its listings encompass all National Historic Landmarks and historic areas administered by the National Park Service.

NRHP guidelines for the evaluation of historic significance were developed to be flexible and to recognize the accomplishments of all who have made significant contributions to the nation's history and heritage. Its criteria are designed to guide federal agencies, state and local governments, and others in evaluating potential entries in the NRHP. For a property to be listed in or determined eligible for listing, it must be demonstrated to possess integrity and to meet at least one of the following criteria:

> The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:
>
> A. That are associated with events that have made a significant contribution to the broad patterns of our history; or
> B. That are associated with the lives of persons significant in our past; or
> C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
> D. That have yielded, or may be likely to yield, information important in prehistory or history.

Integrity is defined in NRHP guidance, How to Apply the National Register Criteria for Evaluation, as "the ability of a property to convey its significance. To be listed in the NRHP, a property must not only be shown to be significant under the NRHP criteria, but it also must have integrity" (NPS 1990). In assessing historic integrity, the NRHP recognizes seven aspects or qualities that, in various combinations, define integrity. In order to retain historic integrity "a property will always possess several, and usually most, of the aspects" (NPS 1990). The seven aspects of integrity are: location, design, setting, workmanship, materials, feeling, and association. NRHP guidance further asserts that properties be completed at least 50 years ago to be considered for eligibility. Properties completed fewer than 50 years before evaluation must be proven to be "exceptionally important" (criteria consideration G) to be considered for listing.

3.4.2.2 State

California Register of Historical Resources

In California, the term "historical resource" includes "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (PRC Section 5020.1(j)). In 1992, the California legislature established the California Register of Historical Resources (CRHR) "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1(a)). The criteria for listing resources on the CRHR, enumerated as follows, were developed to

be in accordance with previously established criteria developed for listing in the NRHP, previously enumerated above. According to Public Resources Code (PRC), Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity" and (ii) meets at least one of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history.

To understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 CCR 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

California Environmental Quality Act

The following California Environmental Quality Act (CEQA) statutes (PRC Section 21000 et seq.) and CEQA Guidelines (14 CCR 15000 et seq.) are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

> PRC Section 21083.2(g) defines "unique archaeological resource" as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria (PRC Section 21083.2(g)):
>
> (1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
> (2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.
> (3) Is directly associated with a scientifically recognized important prehistoric or historic event or person.

- PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a) defines "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource"; it also defines the circumstances when a project would materially impair the significance of a historical resource.
- PRC Section 21074(a) defines "tribal cultural resources."
- PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.

- PRC Sections 21083.2(b) and 21083.2(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures. Preservation in place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; 14 CCR 15064.5(b)). If a site is listed or eligible for listing in the CRHR, included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of PRC Section 5024.1(c)), it is an "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (PRC Section 21084.1; 14 CCR 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (PRC Section 21084.1; 14 CCR 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (14 CCR 15064.5(b)(1); PRC Section 5020.1(q)). In turn, the significance of an historical resource is materially impaired when a project does any of the following (14 CCR 15064.5(b)(2)):

(A) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or

(B) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

(C) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any historical resources, then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance would be materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC Sections 21083.2(a)–(c)). Impacts on non-unique archaeological resources are generally not considered significant environmental impacts (PRC Section 21083.2(a); 14 CCR 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as a tribal cultural resource (PRC Sections 21074(c) and 21083.2(h)), further consideration of significant impacts is required.

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. These procedures are detailed in PRC Section 5097.98.

California Health and Safety Code Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains can occur until the county coroner has examined the remains (Health and Safety Code Section 7050.5(b)). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Health and Safety Code Section 7050.5(c)). The NAHC will notify the "most likely descendant" (MLD). With the permission of the landowner, the most likely descendant may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the MLD by the NAHC. The MLD may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

3.4.2.3 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan

The City's General Plan/Local Coastal Land Use Plan includes the following objectives and policies relevant to the proposed project and cultural resources:

- OSC-16 Preserve Carpinteria's Cultural Resources

  Implementation Policies

  74. Explore all available measures, including purchase, tax relief, purchase of development rights, etc. to avoid development on important archaeological sites. Where these measures are not feasible and development will adversely affect identified archaeological or paleontological resources, require adequate mitigation.
  75. Prohibit activities, other than development, which could damage or destroy archaeological sites, including off-road vehicle use and unauthorized collecting of artifacts.
  76. Review all proposals for development in or adjacent to cultural resource areas for their potential to impact the resource. Give special consideration to development of facilities that enhance the cooperation, enjoyment or maintenance of these areas.
  77. Prior to the city granting a development permit, all archaeological sites (or areas near known archeological sites that have been determined though Phase 1 investigation to potentially include cultural or paleontological resources) must undergo a subsurface test to determine the integrity and significance of the site. Through the project environmental review process, the disposition and/or preservation of any archaeological sites deemed to have significance as a result of the subsurface testing shall be determined. Preservation of cultural/paleontological resource sites through avoidance shall be preferred, however, other methods of disposition may be approved through the environmental review process as identified in the city's Guidelines for the Implementation of CEQA.
  78. A qualified archaeologist and Native American observer (acceptable to the city) shall be retained to monitor grading activities on identified archeological sites and in the vicinity of identified archaeological

resources. If cultural artifacts or similar material of potential cultural or paleontological importance, are uncovered during grading or other excavation the following shall occur:

a. The monitor or archaeologist shall halt the grading or excavation and notify the City.
b. A qualified archaeologist shall prepare a report assessing the significance of the find and recommending any actions to be taken by the applicant(s) prior to the city granting permission for grading to resume.
c. The removal of cultural artifacts or other materials shall only occur after preparation of the report and in conformance with the recommendations of the report as approved by the City.

Santa Barbara County Article II Coastal Zoning Ordinance

Pursuant to PRC Section 30500 of the California Coastal Act of 1976, Santa Barbara County was required to prepare a Local Coastal Program (LCP) for portions of the unincorporated areas of Santa Barbara County within the coastal zone. Sections of the Santa Barbara County Article II Zoning Ordinance that may be relevant to the proposed project include standards for archaeological resources (Section 35-65).

Section 35-65. Archaeology

1. When developments are proposed for lots where archaeological or other cultural sites are located, project design shall be required which avoids impacts to such cultural sites if possible.
2. When sufficient planning flexibility does not permit avoiding construction on archaeological or other types of cultural sites, adequate mitigation shall be required. Mitigation shall be designed in accord with guidelines of the State Office of Historic Preservation and the State of California Native American Heritage Commission.
3. Native Americans shall be consulted when development proposals are submitted which impact significant archaeological or cultural sites.

Santa Barbara County Coastal Land Use Plan

The Santa Barbara County Coastal Land Use Plan was partially certified by the Coastal Commission on March 17, 1981 and is the Local Coastal Program for unincorporated Santa Barbara County. It details the rules and regulations of land use within Santa Barbara County's coastal areas. The following policies would apply to the proposed project.

- Policy 10-1: All available measures, including purchase, tax relief, purchase of development rights, etc., shall be explored to avoid development on significant historic, prehistoric, archaeological, and other classes of cultural sites.
- Policy 10-2: When developments are proposed for parcels where archaeological or other cultural sites are located, Project design shall be required which avoids impacts to such cultural sites if possible.
- Policy 10-3: When sufficient planning flexibility does not permit avoiding construction on archaeological or other types of cultural sites, adequate mitigation shall be required. Mitigation shall be designed in accord with guidelines of the State Office of Historic Preservation and the State of California Native American Heritage Commission.

3.4.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to cultural resources are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to cultural resources would occur if the project would:

a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5.
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5.
c) Disturb any human remains, including those interred outside of dedicated cemeteries.
d) Result in a cumulatively considerable impact to cultural resources.

3.4.4 Impact Analysis

a) Would the project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?

One previously recorded cultural resource site partially intersects the proposed project area (CA-SBA-1168); CA-SBA-1168 is a prehistoric archaeological site and therefore, no historical built environment resources exist within or near the proposed project site. CA-SBA-1168 has not been evaluated for NRHP or CRHR eligibility; however, based on the site record description, it likely meets the criteria for eligibility on either or both the CRHR and NRHP.

Extensive topographic modification of the existing terrain in the proposed project area overlapping CA-SBA-1168 occurred with construction of U.S. Highway 101 in the late 1960s, after the earliest archeological investigations in this area were completed. Information to conclusively define the boundary of CA-SBA-1168 compared to limits of earthwork completed for the U.S. Highway 101 construction does not evidently exist (the boundary description in the original archaeological investigation was poorly described, and was not verified with perimeter excavations at many points). It is therefore possible that some portion of CA-SBA-1168 exists at depth beneath fill materials used to construct some of the slope faces along the south side of U.S. Highway 101. Deep excavations for the Rincon Trail UPRR bridge foundation on both the northern and southern sides of the UPRR alignment could potentially encounter intact deposits associated with CA-SBA-1168. Additionally, based on information gathered during AB-52 consultation, the fill materials placed on portions of CA-SBA-1168 originated from the immediate area and could retain displaced cultural material from CA-SBA-1168 and other surrounding sites. Therefore, the proposed project could have potentially significant impacts to archaeological resources. Mitigation measures CR-1 through CR-4 are required in order to address this impact. Implementation of **Mitigation Measure (MM) CR-1** through **MM-CR-4** would reduce impacts to historical resources to **less than significant with mitigation.**

b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

The current updated Phase 1 Cultural Resources Survey identified several pieces of weathered shellfish within the proposed project area, in disturbed contexts near the metal gate at the western end of Rincon Beach County Park and along the northern edge of the Rincon Beach County Park parking lot. Particularly since the shellfish pieces were identified on the ground surface in areas that have been impacted by previous grading and documented placement of fill soils, their location is considered to be the result of modern activities and soil movement (i.e., grading associated with construction of U.S. Highway 101, the UPRR alignment, an asphalt path and the Rincon Beach County Park parking lot) and not an intact or disturbed cultural deposit. The recovered

shellfish, mainly unidentifiable Veneridae (Venus clams), lacked the density and diversity documented at CA-SBA-1. No other cultural material associated with prehistoric occupation including stone tools, animal bone, or groundstone implements were identified. Even if the shellfish were in situ (i.e., in its original depositional location) and associated with prehistoric activity, the shell is not of sufficient density or diversity to provide important information to explain and understand the prehistoric occupation of coastal areas of Santa Barbara County, particularly when compared to the substantial CA-SBA-1 deposits. Additionally, it is important to understand that CA-SBA-1168 is documented as existing under 10-15 feet of imported fill and is only exposed along the south cut of Highway 101. Therefore, the pieces of shellfish observed in disturbed contexts within the proposed project area are not considered a potentially significant archaeological resource under CEQA Guidelines Section 15064.5.a.3, City of Carpinteria Environmental Review Guidelines and Santa Barbara County Cultural Resources Guidelines.

Extensive topographic modification of the existing terrain in the project area occurred with construction of U.S. Highway 101 in the late 1960's, after the earliest archeological investigations in this area were completed. Information to conclusively define the boundary of CA-SBA-1168 compared to limits of earthwork completed for the U.S. Highway 101 construction does not evidently exist (the boundary description in the original archaeological investigation was poorly described, and was not verified with perimeter excavations at many points). It is therefore possible that some portion of CA-SBA-1168 exists at depth beneath fill materials used to construct some of the slope faces along the south side of U.S. Highway 101. Deep excavations for the Rincon Trail UPRR bridge foundation on the both the northern and southern sides of the UPRR alignment could potentially encounter intact deposits associated with CA-SBA-1168. Additionally, based on information gathered during AB-52 consultation, the fill materials placed on portions of CA-SBA-1168 originated from the immediate area and could retain displaced cultural material from CA-SBA-1168 and other surrounding sites. Therefore, the proposed project could have potentially significant impacts to archaeological resources. Mitigation measures CR-1 through CR-4 are required in order to address this impact. Implementation of **MM-CR-1** through **MM-CR-4** would reduce impacts to historical resources to **less than significant with mitigation.**

c) Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

No burial areas have been previously identified or were observed during the pedestrian survey within the proposed project area. The Phase 1 Survey included a search of the Native American Heritage Commission's (NAHC) Sacred Land Files. The search results were negative but did include a strong suggestion from the (NAHC) that specific Native American individuals be contacted to see if they might have any additional information regarding the cultural or archaeological significance of the proposed project site. Tribal consultation was conducted in support of the project and is documented in detail in Section 3.13, Tribal Cultural Resources. No human burials were documented as a result of tribal consultation. No human remains have been identified within the proposed project or within the associated archaeological site CA-SBA-1168 as a result of previous or current archaeological investigations. **No impacts** relating to disturbance of human remains is expected to occur as a result of this project.

d) Would the project result in a cumulatively considerable impact to cultural resources?

Potentially significant project-specific impacts to cultural resources would be reduced to less than significant with implementation of **MM-CR-1, MM-CR-2**, **MM-CR-3**, and **MM-CR-4**, avoiding the potential for the proposed project to contribute to significant cumulative impacts to cultural resources. The project would, therefore, result in a less than cumulatively considerable impact to cultural resources.

3.4.5 Mitigation

The potential exists for significant cultural resources impacts. The project would require the implementation of **MM-CUL-1** through **MM-CUL-4** to reduce such impacts to less than significant levels.

MM-CR-1 Cultural Resource Treatment and Inadvertent Discovery Plan.

Potential impacts to cultural resources shall be minimized through development of protocols for practical adherence of mitigation measures CR-2 and CR-3 prior to and after ground disturbing construction activities associated with the proposed project. These protocols shall be outlined in a Cultural Resource Treatment Plan (CRTP). The CRTP shall be developed by a City-qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards, prior to the implementation of ground disturbing activities and include wording of each mitigation measure CR-2-4, specific and detailed explanation for implementation of each mitigation measure and contact protocol. The CRTP shall be provided to all agency personnel, consulting tribes, contractors and archaeological personnel. The existence and necessity for adherence to the CRTP shall be noted on plans, handbooks, or the like associated with tasks that may incur ground disturbance either intentionally or inadvertently.

Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria/County of Santa Barbara shall contract with a County-qualified/City-approved archaeologist to develop the required CRTP in accordance with the above criteria. **Monitoring:** City of Carpinteria/County of Santa Barbara staff shall review and authorize the CRTP prior to the commencement of ground disturbance activities to ensure that the CRTP adheres to the criteria established in CR-1.

MM-CR-2 Workers Environmental Awareness Program (WEAP) Training.

All personnel participating in tasks that may incur ground disturbance either intentionally or inadvertently shall be briefed regarding unanticipated discoveries prior to the start of said activities. A basic presentation shall be prepared by a City-qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards to inform all personnel working on the project about the archaeological sensitivity of proposed project areas. The purpose of the WEAP training is to provide specific details on the kinds of archaeological materials that may be identified during project activities and explain the importance of and legal basis for the protection of cultural resources. Each personnel shall also be instructed in the proper procedures to follow in the event that cultural resources or human remains are encountered. These procedures include work curtailment or redirection, and the immediate contact of the site supervisor, qualified archaeologist and if human remains are encountered, the County coroner.

Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria/County of Santa Barbara shall contract with a County-qualified/City-approved archaeologist to develop and conduct the required WEAP Training in accordance with the above criteria. **Monitoring:** City of Carpinteria/County of Santa Barbara staff shall ensure the required WEAP training has been conducted by attending the WEAP Training and documenting attendance of required personnel by means of a sign in sheet completed by all attendees of the WEAP Training.

MM-CR-3 **Initial ground disturbing activities shall be monitored by a County-qualified/City-approved archaeologist in accordance with the following specifications:**

Temporary Impact Areas (equipment staging and materials storage outside trail alignment) - a County-qualified/City-approved archaeologist shall monitor transport and placement activities until such time that it is reasonable to ascertain that no additional prehistoric archaeological/cultural resources are located within areas of temporary disturbance of the proposed project site.

Permanent Impact Areas not including bridge piling installation (all areas of the trail alignment excepting the bridge approaches area on both sides of the UPRR alignment) – a County-qualified/ City-approved archaeologist shall monitor project implementation during the initial grading and excavation activities until such time as sufficient subsurface soil has been uncovered/excavated to ascertain that no additional prehistoric archaeological/cultural resources are located on the proposed project improvement area.

Bridge piling installation – a County-qualified/City-approved archaeologist shall monitor the installation of bridge pilings within intact soils and/or any soils deeper than 10 feet below current ground surface to ascertain that no additional prehistoric archaeological/cultural resources are located on the proposed project improvement area.

The monitor shall immediately inform equipment operators in the event archaeological resources are encountered, and shall be empowered to immediately halt construction activity in the area of the discovery until assessment can be completed, and materials recovered as appropriate (refer to CR-2 for additional detail). Monitoring reports shall be provided to the City of Carpinteria/County of Santa Barbara on a monthly basis during construction, with a final monitoring report produced at the conclusion of construction activities and provided to both the City and County.

Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria/County of Santa Barbara shall contract with a County-qualified/City-approved archaeologist to monitor initial ground disturbance activities in accordance with the above criteria. ***Monitoring***: City of Carpinteria/County of Santa Barbara staff shall ensure the contracted archaeologist provide monitoring of initial ground disturbance activities in accordance with the above criteria through receipt of field documentation describing each day of monitoring, construction activity occurring during the monitoring, and observed soil profile conditions related to the potential for presence of archaeological resources.

MM-CR-4 **In the event cultural resources are encountered, construction shall be redirected to another area of the project while data/resource assessment and recovery is accomplished.**

Grading/construction shall be immediately suspended in the immediate area (no less than 50 feet from the area of the discovery) where cultural resources are encountered and temporarily redirected to another portion of the project area to allow the archaeologist to assess the nature, extent and significance of any discoveries and develop appropriate management recommendations for archaeological resource treatment consistent with Santa Barbara County Guidelines for the Implementation of California Environmental Quality Act of 1970 (as amended May 25, 2010). It is anticipated that recovery of artifacts would occur where project elements (such as pilings) would conflict with in situ artifact locations, and such artifacts would be properly archived

in accordance with the project CEQA, City of Carpinteria and Santa Barbara County guidelines and the CRTP protocol.

Identified remedial action for the discovery shall be completed prior to allowing construction to re-commence in the area, no less than 50 feet from the area of the discovery. The project sponsors shall be responsible for funding the assessment of archaeological resources encountered during construction, and for the proper archiving or preservation of such resources. A Phase 3 Archaeological Resources Assessment and Data Recovery Report shall be prepared to document any archaeological resources encountered during construction.

Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria/County of Santa Barbara shall contract with a County-qualified/City-approved archaeologist to provide archaeological assessment and recovery of any archaeological resources encountered during project construction, in accordance with the above criteria. ***Monitoring***: City of Carpinteria/County of Santa Barbara staff shall ensure the contracted archaeologist assess the nature, extent and significance of any archaeological discoveries occurring during project construction and develop appropriate management recommendations for archaeological resource treatment in accordance with the project CEQA, City of Carpinteria and Santa Barbara County guidelines and the CRTP protocol..

The contracted archaeologist shall assess the nature, extent and significance of any archaeological discoveries occurring during project construction and develop appropriate management recommendations for archaeological resource treatment.

3.4.6 Level of Significance After Mitigation

After implementation of **MM-CR-1** through **MM-CR-4**, impacts would be reduced to less than significant.

3.5 Geology and Soils

This section describes the existing geologic and soils conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project. The following analysis is based in part upon the following document:

- Geotechnical Report for the Proposed Rincon Beach Multi-Use Trail, prepared by Bengal Engineering in January 2019, the body of which is included as Appendix E of this Environmental Impact Report (EIR). The complete Geotechnical Report (including all plates and attachments) is on file with the City of Carpinteria.

Other sources consulted are listed in Section 3.5.7, References.

3.5.1 Existing Conditions

The proposed trail alignment lies generally within an elevated marine terrace, which has been subject to extensive grading associated with current and former transportation facilities. Exhibit 3.5-1 is an oblique aerial illustrating the topographic conditions along the northern/western portion of the trail alignment, starting at the existing eastern terminus of Carpinteria Avenue.

Exhibit 3.5-1 Topography of the Northern Trail Portion

US Highway 101 was constructed via massive excavation of earth material, which is immediately evident in the two planar slopes off-set by a bench along the left-hand side of the freeway, The angle of the slope and a mid-elevation bench were created during the cuts for the freeway, to stabilize these manufactured slopes. On the opposite side of the freeway, similar cut slopes were also created, but the cut slopes have become less evident with the growth of vegetative cover. The flat, roughly triangular area at the Carpinteria Avenue terminus was leveled through the local placement of some of the excavated freeway earth materials. With reference to the trail alignment in Exhibit 3.5-1 (the red line), the trail would be located entirely on artificial landforms on the north side of the Union Pacific Railroad (UPRR) alignment. For reference, the ground surface at the "Wave Overhead" (the highway bridge which provides the grade separation between mainline US Highway 101 and the Union Pacific Railroad) was originally approximately 100-feet higher in elevation than today (Bengal 2020), The cut slope along the south of US Highway 101 (right side of US Highway 101 in the aerial) would be re-graded again to form a mid-elevation bench to carry the trail.

Exhibit 3.5-2 shows the topography in the area of the proposed UPRR crossing bridge, which is entirely the result of grading to depress the UPRR tracks below the elevation of the new US Highway 101.

Exhibit 3.5-2 Topography at the Proposed UPRR Bridge Crossing

The planar cut slopes separated by a bench are evident again along the left-side of the railroad tracks, a single less steep cut slope exists along the right-hand side of the tracks. At the location of the Wave Overhead, the railroad line was excavated about 140-feet below the natural grade (Bengal 2020). The red rectangle is the approximate location of the proposed bridge, which would have foundations within the slopes previously created via the rail line excavation. This portion of the trail, the bridge segment, would therefore also only involve artificial landforms, not natural slopes.

Exhibit 3.5-3 illustrates the topography within the portion of the trail along the southern side of the UPRR alignment. The railroad tracks at the bottom left-hand corner lead toward the Wave Overhead, but they originally followed the bench visible along the right side of the ridge. The slope above the bench was cut for the railroad, and along the top of the slope the coastal highway was previously located. Remnants of retaining walls constructed to protect the old highway alignment can be seen sliding from the top of the cut slope manufactured for the former railway bench. Thus, again, this segment of the trail would entirely traverse artificial landforms (i.e., cut slope and bench), here originally created via the UPRR construction. These artificial slope faces would be regraded to a more geotechnically stable configuration (i.e., less steep in profile) and a new bench created upon which to set the trail. In summary,

the entire length of the proposed trail alignment would be located on landforms resulting from former grading for construction of US Highway 101 and current or former UPRR alignments.

Exhibit 3.5-3 Topography of the Southern Trail Portion

Regional Geology

The City of Carpinteria is located in the Transverse Ranges geomorphic province of Southern California. According to the California Geological Survey (CGS), the Transverse Ranges geomorphic province is composed of a series of steep east-west trending mountain ranges, which is in contrast to the northwest trend of coastal California and surrounding mountain ranges (CGS 2002). Geologic deposits within the City and adjacent unincorporated County lands are generally represented by alluvium. The mountains and foothills north of the project site are characterized by alluvium, quaternary nonmarine terrace deposits, Pleistocene nonmarine, Pleistocene volcanic, and Eocene marine deposits (Dibblee and Ehrenspeck 1986; USGS 2009).

Faults and Seismicity

Faults in the Carpinteria area include the Carpinteria Fault, the Rincon Creek Fault, the Arroyo Parida Fault and the Shepard Mesa Fault. According to the State of California Conservation Department, California Geologic Survey (CGS), none of these faults are considered "active" (CGS 1996). The CGS has calculated the probabilities for earthquakes throughout the state of California; the research indicates a 10% probability within the next 50 years for an earthquake between magnitudes 6.5 and 7.0 to occur along a fault within five miles of the Carpinteria Planning Area. The geotechnical report for Rincon Trail (Bengal Engineers 2019) identifies a potential peak ground acceleration of 0.8 g for the project site (“g” represents acceleration rate of gravity). There are no Alquist-Priolo Special Studies Zones for the Carpinteria Planning Area (CGS 2018b). No recent movement (within the last 11,000 years) or recent fault rupture has been identified along the known faults in the Carpinteria Planning Area.

Geologic Formations

The trail alignment north of the UPRR corridor is underlain by Miocene age and older surficial sediments (Qoa or alluvium), bedrock of the Santa Barbara Formation (Qsb) consisting of silty sand and sand-like material, and bedrock of the Monterey Formation (Tm) consisting mainly of sandy silt and siltstone/shale (Dibblee and Ehrenspeck 1986; Bengal Engineers 2019). The trail alignment within and south of the UPRR corridor is underlain directly by bedrock of the Monterey Formation (Tm) siltstone/shale and Sisquoc Formation (Tsq) siltstone/mudstone both consisting mainly of sandy silt/silt-like materials (Dibblee and Ehrenspeck 1986; Bengal Engineers 2019). The Monterey Formation has been identified in some locations to contain an abundance of fossil specimens including birds, fish, sea lions, sea cows, porpoises, whales, and sharks (Dibblee and Ehrenspeck 1986).

Liquefaction

Liquefaction is a phenomenon that occurs when loosely consolidated soils lose their load bearing capabilities during ground shaking and flow in a fluid-like manner. The specific soil condition conducive to liquefaction is loose sands and silty sands below the water table and typically within the top 50 feet of the ground surface. The Bengal geotechnical investigation did not identify the presence of soil horizons that would have the potential for liquefaction (Bengal Engineers 2019). Consequently, soils with liquefaction potential are not anticipated to occur within the trail alignment.

Landslide/Rockfall

Landslides generally occur on steep slopes that have been undercut by erosion or on slopes where the bedding planes of the bedrock are inclined down the slope. The updated project alignment avoids slopes with identified historic landslide activity. However, the Bengal geotechnical investigation found that due to the relatively low shear strength of the Monterey and Sisquoc Formations (Tm and Tsq) and the slope face orientation, the existing ocean-facing slope south of the proposed trail bridge is considered to be susceptible to surficial/local instability under static conditions. These steep slopes in the southern trail alignment are the result of former landform modification carried out for the railroad alignment and former state highway, and do not represent natural conditions resulting from natural weathering of the involved earth materials and geologic formations.

Soil Settlement/Consolidation

Settlement is the downward movement of soil or of structures it supports, resulting from a reduction in the voids in the underlying strata. The Bengal geotechnical investigation did not identify the presence of soil horizons that would have the potential for settlement or consolidation (Bengal Engineers 2019). Consequently, soils with settlement potential are not anticipated to occur within the trail alignment.

Expansive Soils

Expansive soils are those characterized as having a high shrink-swell potential, associated with a high percentage of clay content. The Bengal geotechnical investigation did not identify the presence of soil horizons that would have the potential for expansiveness (Bengal Engineers 2019). Consequently, soils with expansion potential are not anticipated to occur within the trail alignment.

3.5.2 Relevant Plans, Policies, and Ordinances

3.5.2.1 Federal

U.S. Geological Survey Landslide Hazard Program

In fulfillment of the requirements of Public Law 106-113, the USGS created the Landslide Hazard Program in the mid-1970s. According to USGS, the primary objective of the National Landslide Hazards Program is to reduce long-term losses from landslide hazards by improving our understanding of the causes of ground failure and suggesting mitigation strategies (USGS 2018). The federal government takes the lead role in funding and conducting this research, whereas the reduction of losses due to geologic hazards is primarily a state and local responsibility.

3.5.2.2 State

Alquist-Priolo Earthquake Fault Zoning Act (1972)

The Alquist-Priolo Act was passed in 1972 to ensure public safety by prohibiting the siting of most structures for human occupancy across traces of active faults that constitute a potential hazard to structures from surface faulting or fault creep (CGS 2018a). In accordance with this act, the State Geologist established regulatory zones, called "earthquake fault zones," around surface traces of active faults and has published maps showing these zones. Construction within these zones cannot be permitted until a geologic investigation has been conducted to prove that a building planned for human occupancy would not be constructed across an active fault. The project is not located on a site designated to be an active earthquake fault zone (CGS 2018c).

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 (PRC Chapter 7.8, Section 2690 et seq.) directs the CGS to protect the public from earthquake-induced liquefaction and landslide hazards (note that these hazards are distinct from fault surface rupture hazard regulated by the Alquist-Priolo Act). This act requires the State Geologist to delineate various seismic hazard zones and requires cities, counties, and other local permitting agencies to regulate certain development projects within these zones (i.e., zones of required investigation). Before a development permit may be granted for a site within a Seismic Hazard Zone, a geotechnical investigation of the site must be conducted and appropriate mitigation measures incorporated into the project design. Evaluation and mitigation of potential risks from seismic hazards within zones of required investigation must be conducted in accordance with CGS Special Publication 117A, adopted March 13, 1997, by the State Mining and Geology Board, as updated in 2008.

California Building Code (CBC) (2019)

The CBC has been codified in the California Code of Regulations (CCR) as Title 24, Part 2. Title 24 is administered by the California Building Standards Commission, which, by law, is responsible for coordinating all building standards. Under state law, all building standards must be centralized in Title 24 or those standards are not enforceable. The purpose of the CBC is to establish minimum standards to safeguard the public health, safety, and general welfare through structural strength, means of egress facilities, and general stability, by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all building and structures within its jurisdiction. The 2019 edition of the CBC is based on the 2018 International Building Code published by the International Code Conference.

Chapters 16 and 16A of the 2019 CBC include structural design requirements governing seismically resistant construction, including (but not limited to) factors and coefficients used to establish seismic site class and seismic occupancy category for the soil/rock at the building location and the proposed building design. Chapters 18 and 18A include (but are not limited to) the requirements for foundation and soil investigations (Sections 1803 and 1803A); excavation, grading, and fill (Sections 1804 and 1804A); damp-proofing and water-proofing (Sections 1805 and 1805A); allowable load-bearing values of soils (Sections 1806 and 1806A); the design of foundation walls, retaining walls, embedded posts and poles (Sections 1807 and 1807A), and foundations (Sections 1808 and 1808A); and design of shallow foundations (Sections 1809 and 1809A) and deep foundations (Sections 1810 and 1810A). Chapter 33 of the 2019 CBC includes (but is not limited to) requirements for safeguards at work sites to ensure stable excavations and cut or fill slopes (Section 3304).

Construction activities are subject to occupational safety standards for excavation and trenching, as specified in the California Safety and Health Administration regulations (Title 8 of the California Code of Regulations) and in Chapter 33 of the CBC. These regulations specify the measures to be used for excavation and trench work where workers could be exposed to unstable soil conditions. The proposed project would be required to employ these safety measures during excavation and trenching.

Occupational Safety and Health Administration Regulations

In California, the California Occupational Safety and Health Administration (Cal/OSHA) has responsibility for implementing state standards that have been determined to be "as effective as" federal rules relevant to worker safety, including slope protection during construction excavations.

3.5.2.3 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan – Safety Element

The City of Carpinteria General Plan/Local Coastal Land Use Plan outlines goals, policies, and programs designed to protect the community from geologic and seismic hazards. The General Plan/Local Coastal Land Use Plan Safety Element includes the following objectives and policies applicable to the project:

Objective S-1 Minimize the potential risks and reduce the loss of life, property and the economic and social dislocations resulting from fault surface rupture in the planning area, from ground shaking due to an earthquake along a fault in the planning area or in the region, from seismically -induced liquefaction in the planning area, and from seismically-induced tsunamis.

Policy S-1c Development in areas identified as having high seismically-induced liquefaction potential shall follow structural engineering foundation design parameters outlined in the Uniform Building Code or obtained through an independent structural engineering study.

Objective S-2: Minimize the potential risks and reduce the loss of life, property and economic and social dislocations resulting from seismically-induced and naturally-occurring landslides, from mud and debris flows, from rock falls, and from seacliff retreat.

Policy S-2a. Areas identified on Figure S-2 as High Landslide Potential shall either be designated in an open space zoning category or the potential for landslide will be mitigated through avoiding disturbance of the slope area of the site subject to landslide potential.

Policy S-2b. Building improvements and other development including any irrigated landscape areas shall be setback sufficiently to protect the development and all associated improvements from bluff failure and bluff retreat over a 100-year term.

Objective S-3 Minimize the potential risks and reduce the loss of property and the economic and social dislocations resulting from expansive soils, soil settlement, subsidence, and hydrocompaction.

Policy S-3b All new development will comply with the Uniform Building Code, local City building ordinances, and geotechnical recommendations related to construction in areas identified as having a high potential for expansive soils or soil settlement.

Santa Barbara County Comprehensive Plan Seismic Safety and Safety Element

Geologic, soil, and seismic factors affect the suitability of land for various uses and, hence, should be considered, along with other factors, in land use planning to eliminate or minimize their adverse effects. Geologic and Seismic Goal 1 applies to the proposed project (County of Santa Barbara 2011):

- Protect the community to the extent feasible from risks associated with the effects of seismically induced incidents by requiring:
  - Protection Policy 1: The County minimizes the potential effects of geologic, soil, and seismic hazards through the development review process.
  - Protection Policy 2: The County shall refer to the CBC, the Land Use Development Code (LUDC), County Ordinances, the Coastal Land Use Plan (CLUP), and the Comprehensive Plan when considering the siting and construction of structures in seismically hazardous areas.
  - Protection Policy 3: The County shall ensure compliance with state seismic and building standards in the evaluation, design, and siting of critical facilities.
  - Protection Policy 4: The Office of Emergency Services (OES) shall continue coordinating emergency planning for the Santa Barbara Operational Area pursuant to the California Emergency Services Act of 1970.
  - Protection Policy 5: The County shall require a preliminary soil report prepared by a qualified civil engineer be submitted at the time a tentative map is submitted.

Santa Barbara County Comprehensive Plan Environmental Resources Management Element

This element states that urbanization should be prohibited on slopes 30% and greater and should be prohibited, except in a relatively few special instances on slopes between 20% and 30% (County of Santa Barbara 2009).

Santa Barbara County Comprehensive Plan Coastal Land Use Plan

The purpose of the Coastal Land Use Plan (CLUP) is to protect coastal resources while accommodating land use development within the coastal zone. Policies outlined in the CLUP that are applicable to the project are listed below (County of Santa Barbara 2019):

Policy 3-8 Applications for grading and building permits, and applications for subdivision shall be reviewed for adjacency to, threats from, and impacts on geologic hazards arising from seismic events, tsunami runup, landslides, beach erosion, or other geologic hazards such as expansive soils and subsidence

areas. In areas of known geologic hazards, a geologic report shall be required. Mitigation measures shall be required where necessary.

Policy 3-13 Plans for development shall minimize cut and fill operations. Plans requiring excessive cutting and filling may be denied if it is determined that the development could be carried out with less alteration of the natural terrain.

Policy 3-14 All developments shall be designed to fit the site topography, soils, geology, hydrology, and any other existing conditions and be oriented so that grading and other site preparation is kept to an absolute minimum. Natural features, landforms, and native vegetation, such as trees, shall be preserved to the maximum extent feasible. Areas of the site which are not suited to development because of known soil, geologic, flood, erosion or other hazards shall remain in open space.

Policy 3-15 For necessary grading operations on hillsides, the smallest practical area of land shall be exposed at any one time during development, and the length of exposure shall be kept to the shortest practicable amount of time. The clearing of land should be avoided during the winter rainy season and all measures for removing sediments and stabilizing slopes should be in place before the beginning of the rainy season.

Policy 3-16 Sediment basins (including debris basins, desilting basins, or silt traps) shall be installed on the project site in conjunction with the initial grading operations and maintained throughout the development process to remove sediment from runoff waters. All sediment shall be retained on site unless removed to an appropriate dumping location.

Policy 3-17 Temporary vegetation, seeding, mulching, or other suitable stabilization method shall be used to protect soils subject to erosion that have been disturbed during grading or development. All cut and fill slopes shall be stabilized as rapidly as possible with planting of native grasses and shrubs, appropriate non-native plants, or with accepted landscaping practices.

Santa Barbara County Grading Code

Ordinance No. 4766, 11-9-2010 of County Code of Ordinances (SBCCO) addresses compliance with the National Pollutant Discharge Elimination System (NPDES) Phase II stormwater regulations and sets forth local stormwater requirements for the disturbance of less than 1 acre, to avoid pollution of water courses and drainage ways with sediments or other pollutants generated on or caused by surface runoff on or across a construction site.

Santa Barbara County Building Code

SBCCO Ord. No. 4822, 1-17-2012 addresses geological, topographical, and climatic conditions in the County including extreme weather conditions, firefighting resources, flammable vegetation, High Hazard Areas, extreme wind conditions, and seismic shaking and the minimum standards to safeguard and protect life, buildings, and structures within the County.

3.5.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to geology and soils are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to geology and soils would occur if the project would:

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
   i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.
   ii. Strong seismic ground shaking.
   iii. Seismic-related ground failure, including liquefaction.
   iv. Landslides.
b) Result in substantial soil erosion or the loss of topsoil.
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.
g) Result in considerable cumulative impacts to geology and soils.

3.5.3.1 Local Significance Thresholds

City of Carpinteria

The City of Carpinteria's Guidelines for the Implementation of the California Environmental Quality Act of 1970, as Amended (1997), states the following conditions or impacts shall be considered significant:

- The graded or cleared portion of the site includes more than 10,000 square feet of area having a slope greater than 15 percent.
- There is a significant risk that more than 2,500 square feet will be unprotected or inadequately protected from erosion during any portion of the rainy season.
- Grading or clearing will occur within 50 feet of any watercourse or 100-year floodplain.
- Grading will involve cut and fill volumes of 3,000 cubic yards or more, or cut or fill heights of 15 feet or greater.
- The project will significantly increase water runoff, velocities, peak discharges, or water surface elevations on or off-site. Coordinate with the Department of Public Works for clarification.
- The project will produce erosion impacts which constitute a structural hazard or significant visual impact, or will result in sediment or excessive drainage flows which cannot be contained or controlled on-site.
- The project will result in impacts which violate or are in conflict with any of the Federal, State, or local policies, ordinances or regulations listed above.

- Any cut or fill slope over 15 feet in height is potentially significant for grading, visual, erosion, siltation and community character impacts.
- Any grading which includes the addition, removal or moving of earth is potentially significant.
- Any grading proposed within environmentally sensitive areas is potentially significant.

County of Santa Barbara

The County thresholds are similar and include the following criteria:

- The project site or any part of the project is located on land having substantial geologic constraints, as determined by P&D or PWD. Areas constrained by geology include parcels located near active or potentially active faults and property underlain by rock types associated with compressible/collapsible soils or susceptible to landslides or severe erosion. "Special Problems" areas designated by the Board of Supervisors have been established based on geologic constraints, flood hazards and other physical limitations to development.
- The project results in potentially hazardous geologic conditions such as the construction of cut slopes exceeding a grade of 1.5 horizontal to 1 vertical.
- The project proposes construction of a cut slope over 15 feet in height as measured from the lowest finished grade.
- The project is located on slopes exceeding 20% grade.

3.5.4 Impact Analysis

The following analysis is based upon the CEQA Appendix G checklist, as described above.

a) Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42?

ii. Strong seismic ground shaking?

iii. Seismic-related ground failure, including liquefaction?

iv. Landslides?

The California Department of Conservation provides an index map that identifies all Official Maps of Earthquake Fault Zones delineated by the California Geological Survey through December 2010 under the Alquist-Priolo Earthquake Fault Zoning Act. According to the most recent data, the proposed project is not located within an Alquist-Priolo earthquake fault zone; however, the project site is to the north of the Pitas Point quadrangle (CGS 2018c). The northwestern corner of the Pitas Point quadrangle encompasses a very small portion of Santa Barbara County, consisting of the Rincon Point neighborhood south of Rincon Point Lane. The fault line within the Pitas Point Quadrangle that is closest to the proposed project runs northwest-southeast, north of La Conchita Beach in Ventura County, approximately two miles southeast from Rincon Beach County Park (Dibblee and Ehrenspeck 1986).

According to the City of Carpinteria's General Plan Fault Map, the Rincon Creek fault is located to the north of the proposed project and the Carpinteria Fault is located to the south (City of Carpinteria 2003). In the immediate vicinity of the proposed trail and parking lot, the project is located on the up-thrown side on an inferred fault located to the north of US Highway 101 near the connection to Highway 150 (City of Carpinteria 2003). According to the Santa Barbara County's South Coast Seismic Tectonic Map, the entire south coast portion of the county, including the project site, is rated as having a high seismic potential with a moderate possible variation from the assigned rating (County of Santa Barbara 2011). The Santa Barbara County South Coast Seismic Tectonic Map indicates that the Red Mountain fault is the closest known potentially active fault and traverses the proposed trail near the intersection of the UPRR and the trail alignment. The Red Mountain fault is approximately 39 km (24 miles) long and trends in a generally east-west direction, running parallel to the coastline, near the project area. A maximum credible earthquake of moment magnitude 6.8 has been assigned to this reverse displacement fault (CGS 1996).

The proposed project consists of a shared-use path with pedestrian bridge and other trail improvements. The project would not introduce new buildings that would be subject to structural damage in the unlikely event of strong seismic ground shaking. Moreover, there are no existing buildings within the project area that would pose a risk of loss, injury, or death as a result of potential structural damage caused by earth movement. However, the pedestrian bridge structure could be damaged by seismic activity if not designed to withstand the potential peak ground acceleration of 0.8 g, as identified in the Bengal geotechnical report (Appendix E).

Previously manipulated and engineered slopes along the trail alignment are proposed to be re-graded to achieve a finished slope face that is more gradual (less steep) than the existing slope faces. Slopes adjacent to US Highway 101 would be reshaped with those above the trail having a slope ratio of 1.25:1, fill slopes (which would be present only adjacent to the bridge over the UPRR) are proposed to have slope ratios between 2:1 and 4:1. For the portion of the path on the ocean side of the UPRR alignment, the regraded slopes for the trail "bench" would employ cut slopes with a ratio of 1:1 above the trail, while a ratio of 1.25:1 would be employed for the "reinforced" fill slopes below the trail. These slope angles are each shallower than existing conditions, and mid-elevation benches in the slopes would further decrease the potential for mass soil movement (shallow landslides). It is important to note that all of the earthwork proposed for the project involves manipulation of manufactured slopes (previously modified landforms) and not natural topography. In addition, the project proposes to vegetate all new slope areas to minimize the potential for shallow erosion to occur.

The Carpinteria Valley is subject to geologic hazards related primarily to earthquakes and secondary hazards, such as landslides and liquefaction; the project includes manufactured slopes and a bridge structure that could be damaged by seismic ground shaking. As such, potential impacts relating to adverse effects caused by strong seismic ground shaking, or seismic related ground failure would be potentially significant. **Mitigation Measure (MM) GEO-1** through **MM-GEO-3** would reduce impacts to **less than significant with mitigation**.

b) Would the project result in substantial soil erosion or the loss of topsoil?

Soils within the project site have been classified as Xerorthents, cut and fill areas (USDA 2020). The NRCS Web Soil Survey provides an erosion hazard rating that indicates the hazard of soil loss from off-road and off-trail areas after disturbance activities that expose the soil surface. Xerorthents in the project area have a moderate erosion hazard rating, which indicates that some erosion is likely and that erosion control measures may be needed (USDA 2020). The project does propose to vegetate all new slope area to minimize the potential for soil erosion to occur.

To prepare the site for trail construction, the trail alignment along with adjacent slopes would be graded to meet the proposed finished grade surface and to achieve stable slope profiles above and below the trail. It is anticipated that total cut would be approximately 107,386 cubic yards and total fill would be approximately 14,860 cubic yards during the grading phase. Cut material on site would be utilized for the necessary fill material, as feasible. The re-grading of previously manufactured slopes is intended to reduce the angle of the slope face, decreasing historic erosion rates and increasing the long-term stability of the slope faces. The lower angle slopes would not be noticeably different from the existing manufactured slopes but should eliminate or greatly reduce the amount of soil materials moving down the slope areas to be deposited on the trail or areas below the trail. Erosion potential would be lessened with the proposed engineered slope design. However, soil erosion could be increased unless proper slope construction techniques are employed. Accordingly, soil erosion impacts would be potentially significant. **MM-GEO-3** would reduce impacts to **less than significant with mitigation**.

c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Due to relatively low strength of the underlying Monterey Formation (Tm) siltstone/shale bedrock, the single span bridge structure could experience differential settlement and related damage or collapse, a potentially significant impact unless mitigation is required. The Bengal geotechnical report also concluded that from a slope stability perspective, the slopes along the coastal bluff, both above and below the existing unsanctioned County trail are problematic with respect to local/surficial slope instability. The proposed grading plans were reviewed by Bengal and existing slopes and proposed cut slopes were analyzed for gross stability. Shear strength test results were obtained and slope stability analyses were performed to evaluate the global or overall static as well as seismic loading conditions. Based on the Bengal slope stability analysis, the subject slopes containing the proposed trail alignment are considered to have adequate stability against static loading or under normal, short- and long-term service conditions. However, with seismic activity, shallow slope instability could occur. As such, shallow slope instability associated with seismic activity is considered potentially significant. **MM-GEO-3** would reduce impacts to **less than significant with mitigation**.

d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

The Bengal geotechnical report did not identify soils with expansive characteristics, and therefore the potential is very low for expansive soils to be present within the trail alignment. Potential impacts relating to expansive soil would be **less than significant**.

e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

The proposed project does not include restrooms of other waste generating facilities that would require the use of septic tanks, sewers or alternative wastewater disposal systems. **No impact** would occur

f) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

The soil in the area of the proposed trail was characterized as Xerorthents, cut and fill areas consisting of mechanically manipulated soils where the original profile is no longer discernible (USDA 2020). Monterey

Formation marine siliceous shale of the early to late Miocene age, sand and cobbles of the Santa Barbara formation, and older dissected surficial sediments composed of former alluvial deposits of silt, sand and gravel that in places are weakly consolidated, form the geologic base of the project site (Dibblee and Ehrenspeck 1986). The potential for paleontological resources to be encountered during project grading is low due to the extensive historical cut and fill within the project area and due to the existing quality of soils, which have been mechanically manipulated as a result of previous construction projects.

The Phase 1 survey found that no prehistoric artifacts are mixed with modern debris and that the area has already been subject to extensive ground disturbances associated with construction. The Phase 1 conclusion is confirmed by the previous SAIC investigation (SAIC 1996) that was conducted along the northern edge of the Rincon Beach County Park parking lot for a cellular communications facility. The investigation concluded that prehistoric artifacts were mixed with modern debris and the area had been subject to extensive ground disturbances associated with the construction, and subsequent abandonment, of US Highway 101. Therefore, the prehistoric cultural remains were not considered an important resource and no additional measures were required. Impacts would be **less than significant**

g) Would the project result in considerable cumulative impacts to geology and soils?

Cumulative development throughout the Carpinteria Valley would incrementally contribute to geologic resource impacts. However, the project's contribution to cumulative geologic resource impacts would not be considerable based on the information above because the project impacts would each be reduced to less than significant with incorporation of required mitigation measures.

3.5.5 Mitigation

The potential exists for significant geology-related impacts to occur involving structural damage from seismic events, differential settlement of the pedestrian bridge structure, shallow slope instability associated with seismic activity, and increased soil erosion on slopes graded for the project. The project would require the implementation of **MM-GEO-1** to **MM-GEO-3** to reduce such impacts.

MM-GEO-1 **Seismicity.** The pedestrian bridge shall adhere to the recommendation identified in Appendix E to this Environmental Impact Report to withstand a peak ground acceleration (PGA) at the site of 0.8g generated by an earthquake of moment magnitude Mw=7.4.

Plan Requirements and Timing: Prior to issuance of a grading or building permit, the City of Carpinteria/County of Santa Barbara shall verify the engineering plans include this bridge design specification. ***Monitoring***: City of Carpinteria/County of Santa Barbara public works staff or construction inspector retained for the project shall inspect bridge construction to verify conformance with this specification.

MM-GEO-2 **Differential Settlement of Pedestrian Bridge Foundations.** Bridge foundation construction shall adhere to the recommendation identified in Appendix E to this Environmental Impact Report, which specifies a deep foundation employing cast-in-drilled hole (CIDH) piles. Based on the anticipated loadings, Caltrans Standard Plan 24" CIDH Concrete Piles with 200 kips design capacity are recommended in the geotechnical report. Should hard cemented bedrock be encountered during the installation of the CIDH piles, coring may be necessary.

Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria/County of Santa Barbara shall verify the engineering plans include this bridge foundation specification. ***Monitoring***: City of Carpinteria/County of Santa Barbara public works staff or construction inspector retained for the project shall inspect foundation construction to verify conformance with this specification.

MM-GEO-3 **Soil Erosion/Slope Stability.** Slope construction shall adhere to the recommendations in the geotechnical report, summarized below.

1. All new fills placed along the trail alignment shall be placed as engineered geotextile-reinforced soils with subsurface/back drains.
2. Manufactured slope profiles shall be no steeper than as specified in the Bengal 2019 geotechnical report (Appendix E), or any updated version thereof which has been prepared to address final trail design.
3. Install adequate surface drainage facilities to collect and dispose of surface runoff properly, consistent with the drainage system designs included in 30% Project Plans for Rincon Multi-Use Trail (Appendix E), or as updated to address final trail design.
4. Hydro-seed the exposed newly cut and fill surfaces. Periodic watering and re-application of hydro-seed shall occur as necessary until vegetation on slope surfaces has been successfully established.

These measures, in conjunction with the slope flattening and load reduction resulting from the proposed slope cutbacks, should substantially reduce the hazards associated with both slope erosion and local/surficial slope instability under both static and seismic loading conditions.

Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria/County of Santa Barbara shall verify the engineering plans include the above specifications. ***Monitoring***: City of Carpinteria/County of Santa Barbara public works staff or construction inspector retained for the project shall inspect slope and drainage system construction to verify conformance with these specifications.

3.5.6 Level of Significance After Mitigation

Potential impacts related to geology and soils would be reduced to less than significant with implementation of mitigation measures GEO-1, GEO-2, and GEO-3.

3.6 Greenhouse Gas Emissions

This section describes the existing greenhouse gas (GHG) emissions conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project.

3.6.1 Existing Conditions

3.6.1.1 Climate Change Overview

Climate change refers to any significant change in measures of climate—such as temperature, precipitation, or wind patterns—lasting for an extended period of time (decades or longer). The Earth's temperature depends on the balance between energy entering and leaving the planet's system. Many factors, both natural and human, can cause changes in Earth's energy balance, including variations in the Sun's energy reaching Earth, changes in the reflectivity of Earth's atmosphere and surface, and changes in the greenhouse effect, which affects the amount of heat retained by Earth's atmosphere (EPA 2017).

The greenhouse effect is the trapping and build-up of heat in the atmosphere (troposphere) near the Earth's surface. The greenhouse effect traps heat in the troposphere through a threefold process as follows: short-wave radiation emitted by the Sun is absorbed by the Earth; the Earth emits a portion of this energy in the form of long-wave radiation; and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and toward the Earth. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature and creates a pleasant, livable environment on Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing the Earth's surface temperature to rise.

The scientific record of the Earth's climate shows that the climate system varies naturally over a wide range of time scales and that, in general, climate changes prior to the Industrial Revolution in the 1700s can be explained by natural causes, such as changes in solar energy, volcanic eruptions, and natural changes in GHG concentrations. Recent climate changes, in particular the warming observed over the past century, however, cannot be explained by natural causes alone. Rather, it is extremely likely that human activities have been the dominant cause of that warming since the mid-20th century and is the most significant driver of observed climate change (EPA 2017; IPCC 2013). Human influence on the climate system is evident from the increasing GHG concentrations in the atmosphere, positive radiative forcing, observed warming, and improved understanding of the climate system (IPCC 2013). The atmospheric concentrations of GHGs have increased to levels unprecedented in the last 800,000 years, primarily from fossil fuel emissions and secondarily from emissions associated with land use changes (IPCC 2013). Continued emissions of GHGs will cause further warming and changes in all components of the climate system as discussed further in Section 3.6.1.5, Potential Effects of Climate Change.

3.6.1.2 Greenhouse Gases

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. GHGs include, but are not limited to, carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), ozone (O_3), water vapor, hydrofluorocarbons (HFCs), hydrochlorofluorocarbons (HCFCs), perfluorocarbons (PFCs), and

sulfur hexafluoride (SF_6).[1] Some GHGs—such as CO_2, CH_4, and N_2O—occur naturally and are emitted to the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Manufactured GHGs, which have a much greater heat-absorption potential than CO_2, include fluorinated gases (e.g., HFCs, HCFCs, PFCs, and SF_6), which are associated with certain industrial products and processes. A summary of the most common GHGs and their sources is included in the following text.[2] Also included is a discussion of other climate-forcing substances.

Carbon Dioxide. CO_2 is a naturally occurring gas and a by-product of human activities, and is the principal anthropogenic GHG that affects the Earth's radiative balance. Natural sources of CO_2 include respiration of bacteria, plants, animals, and fungus; evaporation from oceans; volcanic out-gassing; and decomposition of dead organic matter. Human activities that generate CO_2 are from the combustion of fuels (e.g., coal, oil, natural gas, and wood) and changes in land use.

Methane. CH_4 is produced through both natural and human activities. CH_4 is a flammable gas and is the main component of natural gas. CH_4 is produced through anaerobic (without oxygen) decomposition of waste in landfills, flooded rice fields, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

Nitrous Oxide. N_2O is produced through natural and human activities, mainly through agricultural activities and natural biological processes, although fuel burning and other processes also create N_2O. Sources of N_2O include soil cultivation practices (microbial processes in soil and water), especially the use of commercial and organic fertilizers; manure management; industrial processes, such as in nitric acid production, nylon production, and fossil-fuel-fired power plants; vehicle emissions; and using N_2O as a propellant (such as in rockets, race cars, and aerosol sprays).

Fluorinated Gases. Fluorinated gases (also referred to as F-gases) are synthetic powerful GHGs emitted from many industrial processes. Fluorinated gases are commonly used as substitutes for stratospheric O_3-depleting substances (e.g., chlorofluorocarbons [CFCs], HCFCs, and halons). The most prevalent fluorinated gases include the following:

- **Hydrofluorocarbons:** HFCs are compounds containing only hydrogen, fluorine, and carbon atoms. HFCs are synthetic chemicals used as alternatives to O_3-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as byproducts of industrial processes and are used in manufacturing.
- **Perfluorocarbons:** PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals were introduced as alternatives, along with HFCs, to O_3-depleting substances. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Since PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere, these chemicals have long lifetimes, ranging between 10,000 and 50,000 years.
- **Sulfur Hexafluoride:** SF_6 is a colorless gas that is soluble in alcohol and ether and slightly soluble in water. SF_6 is used for insulation in electric power transmission and distribution equipment, semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.
- **Nitrogen Trifluoride:** Nitrogen trifluoride is used in the manufacture of a variety of electronics, including semiconductors and flat panel displays.

[1] California Health and Safety Code 38505 identifies seven GHGs that CARB is responsible for monitoring and regulating to reduce emissions: CO_2, CH_4, N_2O, SF_6, HFCs, PFCs, and nitrogen trifluoride.

[2] The descriptions of GHGs are summarized from the Intergovernmental Panel on Climate Change (IPCC) Second Assessment Report (1995), IPCC Fourth Assessment Report (2007), CARB's Glossary of Terms Used in GHG Inventories (CARB 2015), and the EPA's Glossary of Climate Change Terms (EPA 2016).

Chlorofluorocarbons. CFCs are synthetic chemicals that have been used as cleaning solvents, refrigerants, and aerosol propellants. CFCs are chemically unreactive in the lower atmosphere (troposphere), and the production of CFCs was prohibited in 1987 due to the chemical destruction of stratospheric O_3.

Hydrochlorofluorocarbons. HCFCs are a large group of compounds with a structure very close to that of CFCs—containing hydrogen, fluorine, chlorine, and carbon atoms—but including one or more hydrogen atoms. Like HFCs, HCFCs are used in refrigerants and propellants. HCFCs were also used in place of CFCs for some applications; however, their use in general is being phased out.

Black Carbon. Black carbon is a component of fine particulate matter ($PM_{2.5}$), which has been identified as a leading environmental risk factor for premature death. It is produced from the incomplete combustion of fossil fuels and biomass burning, particularly from older diesel engines and forest fires. Black carbon warms the atmosphere by absorbing solar radiation, influences cloud formation, and darkens the surface of snow and ice, which accelerates heat absorption and melting. Black carbon is short lived and varies spatially, which makes it difficult to quantify its global warming potential (GWP). DPM emissions are a major source of black carbon and are toxic air contaminants that have been regulated and controlled in California for several decades to protect public health. In relation to declining DPM from CARB's regulations pertaining to diesel engines, diesel fuels, and burning activities, CARB estimates that annual black carbon emissions in California have reduced by 70% between 1990 and 2010, with 95% control expected by 2020 (CARB 2014).

Water Vapor. The primary source of water vapor is evaporation from the ocean, with additional vapor generated by sublimation (change from solid to gas) from ice and snow, evaporation from other water bodies, and transpiration from plant leaves. Water vapor is the most important, abundant, and variable GHG in the atmosphere and maintains a climate necessary for life.

Ozone. Tropospheric O_3, which is created by photochemical reactions involving gases from both natural sources and human activities, acts as a GHG. Stratospheric O_3, which is created by the interaction between solar ultraviolet radiation and molecular oxygen, plays a decisive role in the stratospheric radiative balance. Depletion of stratospheric O_3, due to chemical reactions that may be enhanced by climate change, results in an increased ground-level flux of ultraviolet-B radiation.

Aerosols. Aerosols are suspensions of particulate matter in a gas emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light.

3.6.1.3 Global Warming Potential

Gases in the atmosphere can contribute to climate change both directly and indirectly. Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects atmospheric processes that alter the radiative balance of the Earth (e.g., affect cloud formation or albedo) (EPA 2016). The Intergovernmental Panel on Climate Change (IPCC) developed the global warming potential (GWP) concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP of a GHG is defined as the ratio of the time-integrated radiative forcing from the instantaneous release of one kilogram of a trace substance relative to that of one kilogram of a reference gas (IPCC 2014). The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in metric tons (MT) of carbon dioxide equivalent (CO_2e).

The current version of CalEEMod (Version 2016.3.2) assumes that the GWP for CH_4 is 25 (so emissions of one MT of CH_4 are equivalent to emissions of 25 MT of CO_2), and the GWP for N_2O is 298, based on the IPCC Fourth Assessment Report (IPCC 2007). The GWP values identified in CalEEMod were applied to the proposed project.

3.6.1.4 Sources of Greenhouse Gas Emissions

Global Inventory

Anthropogenic GHG emissions worldwide in 2017 (the most recent year for which data is available) totaled approximately 50,860 MMT CO_2e, excluding land use change and forestry (Olivier and Peters 2018). Six countries—China, the United States, the Russian Federation, India, Japan, and Brazil—and the European community accounted for approximately 65% of the total global emissions, or approximately 33,290 MMT CO_2e (Olivier and Peters 2018). Table 3.6-1 presents the top GHG-emissions-producing countries and the European Union.

Table 3.6-1. Six Top GHG Producer Countries and the European Union

Emitting Countries	2014 GHG Emissions (MMT CO_2e)[a,b]
China	13,530
United States	6,640
European Union	4,560
India	3,650
Russian Federation	2,220
Japan	1,490
Brazil	1,200
Total	**33,290**

Source: Olivier and Peters 2018.
Notes: GHG = greenhouse gas; MMT CO_2e = million metric tons of carbon dioxide equivalent.
[a] Column may not add due to rounding.
[b] GHG emissions do not include land use change and forestry-related GHG emissions.

National and State Inventories

Per the 2020 EPA Inventory of U.S. GHG Emissions and Sinks: 1990–2018, total U.S. GHG emissions were approximately 6,677 MMT CO_2e in 2018 (EPA 2020). The primary GHG emitted by human activities in the United States was CO_2, which represented approximately 81.3% of total GHG emissions (5,428 MMT CO_2e). The largest source of CO_2, and of overall GHG emissions, was fossil-fuel combustion, which accounted for approximately 92.8% of CO_2 emissions in 2018 (5,032 MMT CO_2e). Relative to the 1990 emissions level, gross U.S. GHG emissions in 2018 were 3.7% higher; however, the gross emissions were down from a high of 15.2% above the 1990 level that occurred in 2007. GHG emissions decreased from 2017 to 2018 by 2.9% (188 MMT CO_2e) and, overall, net emissions in 2018 were 10.2% below 2005 levels (EPA 2020).

According to California's 2000 through 2018 GHG emissions inventory (2019 edition), California emitted 425 MMT CO_2e in 2018, including emissions resulting from out-of-state electrical generation (CARB 2020). The sources of GHG emissions in California include transportation, industry, electric power production from both in-state and out-of-state sources, residential and commercial activities, agriculture, high GWP substances, and recycling and waste. The California GHG emission source categories and their relative contributions in 2018 are presented in Table 3.6-2.

Table 3.6-2. GHG Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total[a]
Transportation	169.5	39.8%
Electric Power	63.1	14.8%
Industrial	89.2	21.0%
Commercial and Residential	41.4	9.7%
Agriculture	32.6	7.7%
High GWP	20.5	4.8%
Recycling and Waste	9.1	2.1%
Total	**425.4**	**100%**

Source: CARB 2020.
Notes: GHG = greenhouse gas; MMT CO_2e = million metric tons of carbon dioxide equivalent.
[a] Column may not add due to rounding.

Between 2000 and 2018, per-capita GHG emissions in California dropped from a peak of 14.0 MT per person in 2001 to 10.7 MT per person in 2018, representing a 24% decrease. In addition, total GHG emissions in 2018 were approximately 1 MMT CO_2e more than 2017 emissions (CARB 2020).

The City of Carpinteria (City) provided an update to their GHG emission inventory in their Energy and Climate Action Plan 2017 Progress Report (County of Santa Barbara 2018). GHG emissions for the County of Santa Barbara (County) in 2016 are presented in Table 3.6-3.

Table 3.6-3. GHG Emissions Sources in the County of Santa Barbara

Source Category	Annual GHG Emissions (MT CO_2e)	Percent of Total[a]
Transportation	588,246	45.0%
Building Energy	374,164	28.6%
Off-Road	138,950	10.6%
Agriculture	119,360	9.1%
Solid Waste	82,750	6.3%
Water and Wastewater	3,364	0.3%
Totals	**1,306,833**	**100.0%**

Source: County of Santa Barbara 2017.
Notes: GHG = greenhouse gas; MT CO_2e = metric tons of carbon dioxide equivalent per year.
Emissions reflect the 2016 County of Santa Barbara GHG inventory.
[a] Percentage of total has been rounded, and total may not sum due to rounding.

3.6.1.5 Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources through uncertain impacts related to future air temperatures and precipitation patterns. The 2014 Intergovernmental Panel on Climate Change Synthesis Report indicated that warming of the climate system is unequivocal, and since the 1950s, many of the observed changes are unprecedented over decades to millennia. Signs that global climate change has occurred include warming of the atmosphere and ocean, diminished amounts of snow and ice, and rising sea levels (IPCC 2014).

In California, climate change impacts have the potential to affect sea-level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, and electricity demand and supply (CCCC 2006). The primary effect of global climate change has been a 0.2°C rise in average global tropospheric temperature per decade, determined from meteorological measurements worldwide between 1990 and 2005. Scientific modeling predicts that continued emissions of GHGs at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. A warming of about 0.2°C [0.36°F]) per decade is projected, and there are identifiable signs that global warming could be taking place.

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. The average temperatures in California have increased, leading to more extreme hot days and fewer cold nights; shifts in the water cycle have been observed, with less winter precipitation falling as snow, and both snowmelt and rainwater running off earlier in the year; sea levels have risen; and wildland fires are becoming more frequent and intense due to dry seasons that start earlier and end later (CAT 2010).

An increase in annual average temperature is a reasonably foreseeable effect of climate change. Observed changes over the last several decades across the Western United States reveal clear signals of climate change. Statewide average temperatures increased by about 1.7°F from 1895 to 2011, and warming has been the greatest in the Sierra Nevada (CCCC 2012). By 2050, California is projected to warm by approximately 2.7°F above 2000 averages, a threefold increase in the rate of warming over the last century. By 2100, average temperatures could increase by 4.1°F to 8.6°F, depending on emissions levels. Springtime warming—a critical influence on snowmelt—will be particularly pronounced. Summer temperatures will rise more than winter temperatures, and the increases will be greater in inland California, compared to the coast. Heat waves will be more frequent, hotter, and longer. There will be fewer extremely cold nights (CCCC 2012). It is predicted that the Sierra snowpack, which accounts for approximately half of the surface water storage in California and much of the state's water supply, will decline by 30% to as much as 90% over the next 100 years (CAT 2006).

Model projections for precipitation over California continue to show the Mediterranean pattern of wet winters and dry summers with seasonal, year-to-year, and decade-to-decade variability. For the first time, however, several of the improved climate models shift toward drier conditions by the mid-to-late 21st century in central and, most notably, Southern California. By late-century, all projections show drying, and half of them suggest 30-year average precipitation will decline by more than 10% below the historical average (CCCC 2012).

A summary of current and future climate change impacts to resource areas in California, as discussed in Safeguarding California: Reducing Climate Risk (CNRA 2014), is provided below.

Agriculture. The impacts of climate change on the agricultural sector are far more severe than the typical variability in weather and precipitation patterns that occur year to year. The agriculture sector and farmers face some specific challenges that include more drastic and unpredictable precipitation and weather patterns; extreme weather events that range from severe flooding and extreme drought to destructive storm events; significant shifts in water availably and water quality; changes in pollinator lifecycles; temperature fluctuations, including extreme heat stress and decreased chill hours; increased risks from invasive species and weeds, agricultural pests, and plant diseases; and disruptions to the transportation and energy infrastructure supporting agricultural production. These challenges and associated short-term and long-term impacts can have both positive and negative effects on agricultural production. Nonetheless, it is predicted that current crop and livestock production will suffer long-term negative effects resulting in a substantial decrease in the agricultural sector if climate change is not managed or mitigated.

Biodiversity and Habitat. The state's extensive biodiversity stems from its varied climate and assorted landscapes, which have resulted in numerous habitats where species have evolved and adapted over time. Specific climate change challenges to biodiversity and habitat include species migration in response to climatic changes, range shift and novel combinations of species; pathogens, parasites, and disease; invasive species; extinction risks; changes in the timing of seasonal life-cycle events; food web disruptions; and threshold effects (i.e., a change in the ecosystem that results in a "tipping point" beyond which irreversible damage or loss has occurs). Habitat restoration, conservation, and resource management across California and through collaborative efforts among public, private, and nonprofit agencies has assisted in the effort to fight climate change impacts on biodiversity and habitat. One of the key measures in these efforts is ensuring species' ability to relocate as temperature and water availability fluctuate as a result of climate change.

Energy. The energy sector provides California residents with a supply of reliable and affordable energy through a complex integrated system. Specific climate change challenges for the energy sector include temperature, fluctuating precipitation patterns, increasing extreme weather events, and sea-level rise. Increasing temperatures and reduced snowpack negatively impact the availability of a steady flow of snowmelt to hydroelectric reservoirs. Higher temperatures also reduce the capacity of thermal power plants, since power plant cooling is less efficient at higher ambient temperatures. Increased temperatures will also increase electricity demand associated with air conditioning. Natural gas infrastructure in coastal California is threatened by sea-level rise and extreme storm events.

Forestry. Forests occupy approximately 33% of California's 100 million acres and provide key benefits, such as wildlife habitat, absorption of CO_2, renewable energy, and building materials. The most significant climate change-related risks to forests are accelerated risk of wildfire and more frequent and severe droughts. Droughts have resulted in more large-scale mortalities and, combined with increasing temperatures, have led to an overall increase in wildfire risks. Increased wildfire intensity subsequently increases public safety risks, property damage, fire suppression and emergency response costs, watershed and water quality impacts, and vegetation conversions. These factors contribute to decreased forest growth, geographic shifts in tree distribution, loss of fish and wildlife habitat, and decreased carbon absorption. Climate change may result in increased establishment of non-native species, particularly in rangelands where invasive species are already a problem. Invasive species may be able to exploit temperature or precipitation changes or quickly occupy areas denuded by fire, insect mortality, or other climate change effects on vegetation.

Ocean and Coastal Ecosystems and Resources. Sea-level rise, changing ocean conditions, and other climate change stressors are likely to exacerbate long-standing challenges related to ocean and coastal ecosystems in addition to threatening people and infrastructure located along the California coastline and in coastal communities. Sea-level rise, in addition to more frequent and severe coastal storms and erosion, is threatening vital infrastructure, such as roads, bridges, power plants, ports and airports, gasoline pipes, and emergency facilities, as well as negatively impacting the coastal recreational assets, such as beaches and tidal wetlands. Water quality and ocean acidification threaten the abundance of seafood and other plant and wildlife habitats throughout California and globally.

Public Health. Climate change can impact public health through various environmental changes and is the largest threat to human health in the 21st century. Changes in precipitation patterns affect public health primarily through potential for altered water supplies and extreme events, such as heat, floods, droughts, and wildfires. Increased frequency, intensity, and duration of extreme heat and heat waves is likely to increase the risk of mortality due to heat-related illness, as well as exacerbate existing chronic health conditions. Other extreme weather events are likely to negatively impact air quality and increase or intensify respiratory illness, such as asthma and allergies. Additional health impacts that may be caused by climate change include cardiovascular

disease, vector-borne diseases, mental health impacts, and malnutrition injuries. Increased frequency of these ailments is likely to subsequently increase the direct risk of injury and/or mortality.

Transportation. Residents of California rely on airports, seaports, public transportation, and an extensive roadway network to gain access to destinations, goods, and services. While the transportation industry is a source of GHG emissions, it is also vulnerable to climate change risks. Particularly, sea-level rise and erosion threaten many coastal California roadways, airports, seaports, transit systems, bridge supports, and energy and fueling infrastructure. Increasing temperatures and extended periods of extreme heat threaten the integrity of the roadways and rail lines. High temperatures cause the road surfaces to expand, which leads to increased pressure and pavement buckling. High temperatures can also cause rail breakages, which could lead to train derailment. Other forms of extreme weather events, such as extreme storm events, can negatively impact infrastructure, which can impair movement of peoples and goods, or potentially block evacuation routes and emergency access roads. Increased wildfires, flooding, erosion risks, landslides, mudslides, and rockslides can all profoundly impact the transportation system and pose a serious risk to public safety.

Water. Water resources in California support residences, plants, wildlife, farmland, landscapes, and ecosystems and bring trillions of dollars in economic activity. Climate change could seriously impact the timing, form, amount of precipitation, runoff patterns, and frequency and severity of precipitation events. Higher temperatures reduce the amount of snowpack and lead to earlier snowmelt, which can impact water supply availability, natural ecosystems, and winter recreation. Water supply availability during the intense dry summer months is heavily dependent on the snowpack accumulated during the winter. Increased risk of flooding has a variety of public health concerns, including water quality, public safety, property damage, displacement, and post-disaster mental health problems. Prolonged and intensified droughts can also negatively affect groundwater reserves and result in increased overdraft and subsidence. Droughts can negatively impact agriculture and farmland throughout the state. The higher risk of wildfires can lead to increased erosion, which can negatively impact watersheds and result in poor water quality. Water temperatures are also prone to increase, which can negatively impact wildlife that rely on a specific range of temperatures for suitable habitat.

In May 2017, the CNRA released the draft Safeguarding California Plan: 2017 Update, which was a survey of programmatic responses for climate change and contained recommendations for further actions (CNRA 2017).

3.6.2 Relevant Plans, Policies, and Ordinances

3.6.2.1 Federal

Massachusetts v. EPA

In *Massachusetts v. EPA* (April 2007), the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In December 2009, the administrator signed a final rule with the following two distinct findings regarding GHGs under Section 202(a) of the Clean Air Act (CAA):

- The administrator found that elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is the "endangerment finding."

- The administrator further found the combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the CAA.

Energy Independence and Security Act

The Energy Independence and Security Act of 2007 (December 2007), among other key measures, would do the following, which would aid in the reduction of national GHG emissions (EPA 2007):

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Federal Vehicle Standards

In response to the Massachusetts *v. EPA* ruling, the Bush Administration issued Executive Order (EO) 13432 in 2007 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011. In 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012 through 2016 (75 FR 25324–25728).

In 2010, President Obama issued a memorandum directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017 through 2025 light-duty vehicles. The proposed standards projected to achieve 163 grams/mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017 through 2021 (77 FR 62624–63200), and NHTSA intends to set standards for model years 2022 through 2025 in a future rulemaking.

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014 through 2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6% to 23% over the 2010 baselines (76 FR 57106–57513).

In August 2016, the EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types of sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion MT and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program (EPA and NHTSA 2016).

On September 27, 2019, EPA and NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program." (84 Fed. Reg. 51,310), which became effective November 26, 2019. The Part One Rule revokes California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. The Part One Rule impacts some of the underlying assumptions in the CARB EMFAC 2014 and EMFAC 2017 models for criteria air pollutant emissions from gasoline light-duty vehicles, which CARB released off-model adjustment factors for on November 20, 2019, primarily for use in federal Clean Air Act conformity demonstration analyses. Part Two of these regulations has not been adopted yet. Because CARB does not know the full impacts of these rules until Part Two is released, no off-model adjustments factors are available for GHG emissions at this time. In addition, the EMFAC off-model adjustments have not yet been incorporated into CalEEMod. This issue is evolving as California and 22 other states, as well as the District of Columbia and two cities, filed suit against the EPA over the vehicle waiver revocation on November 15, 2019 and a petition for reconsideration of the rule was filed on November 26, 2019 by California and 22 other states, the District of Columbia, and four cities. Accordingly, the timing and consequences of these types of federal decisions and subsequent challenges are speculative at this time.

3.6.2.2 State

The statewide GHG emissions regulatory framework is summarized below by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, solid waste, water, and other state regulations and goals. The following text describes executive orders, legislation, regulations, and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues.

State Climate Change Targets

Executive Order S-3-05

EO S-3-05 (June 2005) established the following statewide goals: GHG emissions should be reduced to 2000 levels by 2010, GHG emissions should be reduced to 1990 levels by 2020, and GHG emissions should be reduced to 80% below 1990 levels by 2050.

Assembly Bill 32 and CARB's Climate Change Scoping Plan

In furtherance of the goals established in EO S-3-05, the Legislature enacted AB 32, the California Global Warming Solutions Act of 2006. Assembly Bill (AB) 32 requires California to reduce its GHG emissions to 1990 levels by 2020.

Under AB 32, CARB is responsible for and is recognized as having the expertise to carry out and develop the programs and requirements necessary to achieve the GHG emissions reduction mandate of AB 32. Under AB 32, CARB must adopt regulations requiring the reporting and verification of statewide GHG emissions from specified sources. This program is used to monitor and enforce compliance with established standards. CARB also is required to adopt rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emission reductions. AB 32 relatedly authorized CARB to adopt market-based compliance mechanisms to meet the specified

requirements. Finally, CARB is ultimately responsible for monitoring compliance and enforcing any rule, regulation, order, emission limitation, emission reduction measure, or market-based compliance mechanism adopted.

In 2007, CARB approved a limit on the statewide GHG emissions level for year 2020 consistent with the determined 1990 baseline (427 million metric tons [MMT] CO_2e). CARB's adoption of this limit is in accordance with Health and Safety Code, Section 38550.

Further, in 2008, CARB adopted the Climate Change Scoping Plan: A Framework for Change (Scoping Plan) in accordance with Health and Safety Code, Section 38561. The Scoping Plan establishes an overall framework for the measures that would be adopted to reduce California's GHG emissions for various emission sources/sectors to 1990 levels by 2020 (CARB 2008). The Scoping Plan evaluates opportunities for sector-specific reductions, integrates all CARB and Climate Action Team early actions and additional GHG reduction features by both entities, identifies additional measures to be pursued as regulations, and outlines the role of a cap-and-trade program. The key elements of the Scoping Plan include the following (CARB 2008):

1. Expanding and strengthening existing energy efficiency programs as well as building and appliance standards.
2. Achieving a statewide renewable energy mix of 33%.
3. Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85% of California's GHG emissions.
4. Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets.
5. Adopting and implementing measures pursuant to existing state laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard.
6. Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.

In the Scoping Plan, CARB determined that achieving the 1990 emissions level in 2020 would require a reduction in GHG emissions of approximately 29% from the otherwise projected 2020 emissions level (i.e., those emissions that would occur in 2020, absent GHG-reducing laws and regulations [referred to as "business-as-usual"]). For purposes of calculating this percent reduction, CARB assumed that all new electricity generation would be supplied by natural gas plants, no further regulatory action would impact vehicle fuel efficiency, and building energy efficiency codes would be held at 2005 standards.

In the 2011 Final Supplement to the Scoping Plan's Functional Equivalent Document (Final Supplement), CARB revised its estimates of the projected 2020 emissions level in light of the economic recession and the availability of updated information about GHG-reduction regulations. Based on the new economic data, CARB determined that achieving the 1990 emissions level by 2020 would require a reduction in GHG emissions of 22% (down from 29%) from the business-as-usual conditions. When the 2020 emissions level projection was updated to account for newly implemented regulatory measures, including Pavley I (model years 2009 through 2016) and the Renewables Portfolio Standard (RPS) (12% to 20%), CARB determined that achieving the 1990 emissions level in 2020 would require a reduction in GHG emissions of 16% (down from 29%) from the business-as-usual conditions.

In 2014, CARB adopted the First Update to the Climate Change Scoping Plan: Building on the Framework (First Update). The stated purpose of the First Update is to "highlight California's success to date in reducing its GHG emissions and lay the foundation for establishing a broad framework for continued emission reductions beyond 2020, on the path to 80% below 1990 levels by 2050" (CARB 2014). The First Update found that California is on

track to meet the 2020 emissions reduction mandate established by AB 32, and noted that California could reduce emissions further by 2030 to levels squarely in line with those needed to stay on track to reduce emissions to 80% below 1990 levels by 2050 if the state realizes the expected benefits of existing policy goals.

In conjunction with the First Update, CARB identified "six key focus areas comprising major components of the state's economy to evaluate and describe the larger transformative actions that will be needed to meet the state's more expansive emission reduction needs by 2050." Those six areas are energy, transportation (e.g., vehicles/equipment, sustainable communities, housing, fuels, infrastructure), agriculture, water, waste management, and natural and working lands. The First Update identifies key recommended actions for each sector that will facilitate achievement of EO S-3-05's 2050 reduction goal (CARB 2014).

Based on CARB's research efforts presented in the First Update, it has a "strong sense of the mix of technologies needed to reduce emissions through 2050." Those technologies include energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies (CARB 2014).

As part of the First Update, CARB recalculated the state's 1990 emissions level using more recent GWPs identified by the IPCC. Using the recalculated 1990 emissions level (431 MMT CO2e) and the revised 2020 emissions level projection identified in the 2011 Final Supplement, CARB determined that achieving the 1990 emissions level by 2020 would require a reduction in GHG emissions of approximately 15% (instead of 29% or 16%) from the business-as-usual conditions (CARB 2014).

On January 20, 2017, CARB released the 2017 Climate Change Scoping Plan Update (Second Update) for public review and comment (CARB 2017). This update proposed CARB's strategy for achieving the state's 2030 GHG target as established in SB 32 (discussed below), including continuing the Cap-and-Trade Program through 2030. The Second Update incorporated approaches to cutting short-lived climate pollutants (SLCPs) under the Short-Lived Climate Pollutant Reduction Strategy (a planning document adopted by CARB in March 2017; SLCP Reduction Strategy), and acknowledged the need for reducing emissions in agriculture and highlighted the work underway to ensure that California's natural and working lands increasingly sequester carbon. During development of the Second Update, CARB held a number of public workshops in the Natural and Working Lands, Agriculture, Energy, and Transportation sectors to inform development of the 2030 Scoping Plan Update (CARB 2017). When discussing project-level GHG emissions-reduction actions and thresholds, the Second Update stated, "Achieving net zero increases in GHG emissions, resulting in no contribution to GHG impacts, may not be feasible or appropriate for every project, however, and the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA" (CARB 2017). The Second Update was approved by CARB's Governing Board on December 14, 2017.

EO B-30-15

EO B-30-15 (April 2015) identified an interim GHG reduction target in support of targets previously identified under EO S-3-05 and AB 32. EO B-30-15 set an interim target goal of reducing statewide GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing statewide GHG emissions to 80% below 1990 levels by 2050, as set forth in EO S-3-05. To facilitate achievement of this goal, EO B-30-15 called for an update to CARB's Scoping Plan to express the 2030 target in terms of MMT CO_2e. The EO also called for state agencies to continue to develop and implement GHG emission reduction programs in support of the reduction targets. EO B-30-15 does not require local agencies to take any action to meet the new interim GHG reduction target.

SB 32 and AB 197

SB 32 and AB 197 (enacted in 2016) are companion bills that set a new statewide GHG reduction targets; made changes to CARB's membership and increased legislative oversight of CARB's climate change-based activities; and expanded dissemination of GHG and other air-quality-related emissions data to enhance transparency and accountability. More specifically, SB 32 codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly, in order to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to CARB as nonvoting members; required CARB to make available and update (at least annually through its website) emissions data for GHGs, criteria air pollutants, and TACs from reporting facilities; and required CARB to identify specific information for GHG emissions-reduction measures when updating the Scoping Plan.

SB 605 and SB 1383

SB 605 (2014) required CARB to complete a comprehensive strategy to reduce emissions of SLCPs in the state; SB 1383 (2016) required CARB to approve and implement the SLCP Reduction Strategy. SB 1383 also established specific targets for the reduction of SLCPs (40% below 2013 levels by 2030 for CH4 and HFCs, and 50% below 2013 levels by 2030 for anthropogenic black carbon), and provided direction for reductions from dairy and livestock operations and landfills. Accordingly, and as mentioned above, CARB adopted its SLCP Reduction Strategy in March 2017, which established a framework for the statewide reduction of emissions of black carbon, CH4, and fluorinated gases.

EO B-55-18

EO B-55-18 (September 2018) established a new statewide goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." This executive order directed CARB to "work with relevant state agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal."

Building Energy

Title 24, Part 6 of the California Code of Regulations

Title 24 of the California Code of Regulations was established in 1978, and serves to enhance and regulate California's building standards. While not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically establishes Building Energy Efficiency Standards that are designed to ensure new and existing buildings in California achieve energy efficiency and preserve outdoor and indoor environmental quality. These energy efficiency standards are reviewed every few years by the Building Standards Commission and the California Energy Commission (CEC) (and revised if necessary) (California Public Resources Code, Section 25402[b][1]). The regulations receive input from members of industry, as well as the public, with the goal of "reducing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (California Public Resources Code, Section 25402). These regulations are carefully scrutinized and analyzed for technological and economic feasibility (California Public Resources Code, Section 25402[d]), and cost effectiveness (California Public Resources Code, Sections 25402[b][2] and [b][3]). These standards are updated to consider and incorporate new energy efficient technologies and construction methods. As a result, these standards save energy, increase electricity supply

reliability, increase indoor comfort, avoid the need to construct new power plants, and help preserve the environment. The 2019 standards continue to improve upon the 2016 standards for new construction of, and additions and alterations to, residential and nonresidential buildings. The 2019 standards went into effect on January 1, 2020.

Title 24, Part 11 of the California Code of Regulations

In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (24 CCR 11) is commonly referred to as CALGreen, and establishes minimum mandatory standards as well as voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential, and state-owned buildings, schools, and hospitals. The CALGreen 2019 standards went into effect on January 1, 2020, and continue to improve upon the 2016 CALGreen standards for new construction of, and additions and alterations to, residential and nonresidential buildings (CALGreen 2016).

The 2019 Title 24 standards are the currently applicable building energy efficiency standards, and became effective on January 1, 2020. The 2019 Title 24 Building Energy Efficiency Standards will further reduce energy used and associated GHG emissions compared to current standards. In general, single-family residences built to the 2019 standards are anticipated to use approximately 7% less energy due to energy efficiency measures than those built to the 2016 standards; once rooftop solar electricity generation is factored in, single-family residences built under the 2019 standards will use approximately 53% less energy than those under the 2016 standards (CEC 2018). Nonresidential buildings built to the 2019 standards are anticipated to use an estimated 30% less energy than those built to the 2016 standards (CEC 2018).

Title 20 of the California Code of Regulations

Title 20 of the California Code of Regulations requires manufacturers of appliances to meet state and federal standards for energy and water efficiency. Performance of appliances must be certified through the CEC to demonstrate compliance with standards. New appliances regulated under Title 20 include refrigerators, refrigerator-freezers, and freezers; room air conditioners and room air-conditioning heat pumps; central air conditioners; spot air conditioners; vented gas space heaters; gas pool heaters; plumbing fittings and plumbing fixtures; fluorescent lamp ballasts; lamps; emergency lighting; traffic signal modules; dishwashers; clothes washers and dryers; cooking products; electric motors; low voltage dry-type distribution transformers; power supplies; televisions and consumer audio and video equipment; and battery charger systems. Title 20 presents protocols for testing for each type of appliance covered under the regulations, and appliances must meet the standards for energy performance, energy design, water performance and water design. Title 20 contains three types of standards for appliances: federal and state standards for federally regulated appliances, state standards for federally regulated appliances, and state standards for non-federally regulated appliances.

AB 1109

Enacted in 2007, AB 1109 required the CEC to adopt minimum energy efficiency standards for general purpose lighting to reduce electricity consumption 50% for indoor residential lighting and 25% for indoor commercial lighting.

Renewable Energy and Energy Procurement

SB 1078

SB 1078 (2002) established the RPS program, which requires an annual increase in renewable generation by the utilities equivalent to at least 1% of sales, with an aggregate goal of 20% by 2017. This goal was subsequently accelerated, requiring utilities to obtain 20% of their power from renewable sources by 2010.

SB 1368

SB 1368 (2006) required the CEC to develop and adopt regulations for GHG emission performance standards for the long-term procurement of electricity by local publicly owned utilities. This effort helps protect energy customers from financial risks associated with investments in carbon-intensive generation by allowing new capital investments in power plants whose GHG emissions are as low as or lower than new combined-cycle natural gas plants by requiring imported electricity to meet GHG performance standards in California and by requiring that the standards be developed and adopted in a public process.

SB X1 2

SB X1 2 (2011) expanded the RPS by establishing that 20% of the total electricity sold to retail customers in California per year by December 31, 2013, and 33% by December 31, 2020, and in subsequent years be secured from qualifying renewable energy sources. Under the bill, a renewable electrical generation facility is one that uses biomass, solar thermal, photovoltaic, wind, geothermal, fuel cells using renewable fuels, small hydroelectric generation of 30 megawatts or less, digester gas, municipal solid waste conversion, landfill gas, ocean wave, ocean thermal, or tidal current, and that meets other specified requirements with respect to its location. In addition to the retail sellers previously covered by the RPS, SB X1 2 added local, publicly owned electric utilities to the RPS.

SB 350

SB 350 (2015) further expanded the RPS by establishing that 50% of the total electricity sold to retail customers in California per year by December 31, 2030, be secured from qualifying renewable energy sources. In addition, SB 350 included the goal to double the energy efficiency savings in electricity and natural gas final end uses (such as heating, cooling, lighting, or class of energy uses on which an energy efficiency program is focused) of retail customers through energy conservation and efficiency. The bill also required the California Public Utilities Commission, in consultation with the CEC, to establish efficiency targets for electrical and gas corporations consistent with this goal.

SB 100

SB 100 (2018) increased the standards set forth in SB 350 establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030 be secured from qualifying renewable energy sources. Under SB 100, it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California. This bill requires that the achievement of 100% zero-carbon electricity resources does not increase the carbon emissions elsewhere in the western grid and that the achievement not occur through resource shuffling.

Mobile Sources

EO S-1-07

Issued on January 18, 2007, EO S-1-07 set a declining Low Carbon Fuel Standard for GHG emissions measured in CO_2e grams per unit of fuel energy sold in California. The target of the Low Carbon Fuel Standard is to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020. The carbon intensity measures the amount of GHG emissions in the lifecycle of a fuel, including extraction/feedstock production, processing, transportation, and final consumption, per unit of energy delivered. CARB adopted the implementing regulation in April 2009. The regulation is expected to increase the production of biofuels, including those from alternative sources, such as algae, wood, and agricultural waste.

SB 375

SB 375 (2008) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 required CARB to adopt regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035. Regional metropolitan planning organizations were then responsible for preparing a Sustainable Communities Strategy (SCS) within their Regional Transportation Plan (RTP). The goal of the SCS is to establish a forecasted development pattern for the region that, after considering transportation measures and policies, would achieve, if feasible, the GHG reduction targets. If a SCS is unable to achieve the GHG reduction target, a metropolitan planning organization must prepare an Alternative Planning Strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

Pursuant to Government Code, Section 65080(b)(2)(K), a SCS does not (i) regulate the use of land; (ii) supersede the land use authority of cities and counties; or (iii) require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with it. Nonetheless, SB 375 makes regional and local planning agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the state-mandated housing element process.

In 2010, CARB adopted the SB 375 targets for the regional metropolitan planning organizations. The targets for SBCAG are a 7% reduction in emissions per capita by 2020 and a 13% reduction by 2035.

SBCAG completed and adopted its 2040 Regional Transportation Plan (2050 RTP/SCS) in August 2013 (SBCAG 2013). In November 2013, CARB, by resolution, accepted SBCAG's GHG emissions quantification analysis and determination that, if implemented, the 2040 RTP/SCS would achieve CARB's 2020 and 2035 GHG emissions-reduction targets for the region. In August 2017, SBCAG adopted the Fast Forward 2040, SBCAG RTP/SCS. Like the 2040 RTP/SCS, the Fast Forward 2040 meets CARB's 2020 and 2035 reduction targets for the region (SBCAG 2017).

Advanced Clean Cars Program

In January 2012, CARB approved the Advanced Clean Cars program, a new emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package. The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars (CARB 2011). To improve air quality, CARB has implemented new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that in 2025, cars will emit 75% less smog-forming pollution than the average

new car sold before 2012. To reduce GHG emissions, CARB, in conjunction with the EPA and the NHTSA, has adopted new GHG standards for model year 2017 to 2025 vehicles; the new standards are estimated to reduce GHG emissions by 34% in 2025. The zero emissions vehicle (ZEV) program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles (EVs) in the 2018 to 2025 model years.

EO B-16-12

EO B-16-12 (2012) directs state entities under the Governor's direction and control to support and facilitate development and distribution of ZEVs. This executive order (EO) also sets a long-term target of reaching 1.5 million ZEVs on California's roadways by 2025. On a statewide basis, EO B-16-12 also establishes a GHG emissions-reduction target from the transportation sector equaling 80% less than 1990 levels by 2050. In furtherance of this EO, the Governor convened an Interagency Working Group on ZEVs that has published multiple reports regarding the progress made on the penetration of ZEVs in the statewide vehicle fleet.

AB 1236

AB 1236 (2015) requires local land use jurisdictions to approve applications for the installation of electric vehicle (EV) charging stations, as defined, through the issuance of specified permits unless there is substantial evidence in the record that the proposed installation would have a specific, adverse impact upon the public health or safety, and there is no feasible method to satisfactorily mitigate or avoid the specific, adverse impact. The bill provides for appeal of that decision to the planning commission, as specified. AB 1236 requires local land use jurisdictions with a population of 200,000 or more residents to adopt an ordinance, by September 30, 2016, which creates an expedited and streamlined permitting process for EV charging stations, as specified. The City added Section 86.0151, Electric Vehicle Parking Regulations, to its municipal code in August 2015 in response to the AB 1236 requirements.

SB 350

In 2015, SB 350—the Clean Energy and Pollution Reduction Act—was enacted into law. As one of its elements, SB 350 established a statewide policy for widespread electrification of the transportation sector, recognizing that such electrification is required for achievement of the state's 2030 and 2050 reduction targets (see Public Utilities Code, Section 740.12).

EO B-48-18

EO B-48-18 (2018) launched an eight-year initiative to accelerate the sale of EVs through a mix of rebate programs and infrastructure improvements. The order also set a new EV target of 5 million EVs in California by 2030. EO B-48-18 included funding for multiple state agencies, including the CEC, to increase EV charging infrastructure and for CARB to provide rebates for the purchase of new EVs and purchase incentives for low-income customers.

Solid Waste

AB 939 and AB 341

In 1989, AB 939, known as the Integrated Waste Management Act (Public Resources Code, Sections 40000 et seq.), was passed because of the increase in waste stream and the decrease in landfill capacity. The statute established the California Integrated Waste Management Board, which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed where jurisdictions were required to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by the year 2000.

AB 341 (2011) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by the year 2020, and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery to develop strategies to achieve the state's policy goal. The California Department of Resources Recycling and Recovery has conducted multiple workshops and published documents that identify priority strategies that it believes would assist the state in reaching the 75% goal by 2020 (CalRecycle 2015).

Water

EO B-29-15

In response to the ongoing drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives have since become permanent water-efficiency standards and requirements. The EO includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources has modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increases the requirements for landscape water use efficiency and broadens its applicability to include new development projects with smaller landscape areas.

Other State Regulations and Goals

SB 97

SB 97 (August 2007) directed the Governor's Office of Planning and Research (OPR) to develop guidelines under CEQA for the mitigation of GHG emissions. In 2008, OPR issued a technical advisory as interim guidance regarding the analysis of GHG emissions in CEQA documents. The advisory indicated that the lead agency should identify and estimate a project's GHG emissions, including those associated with vehicular traffic, energy consumption, water usage, and construction activities (OPR 2008). The advisory further recommended that the lead agency determine significance of the impacts and impose all mitigation measures necessary to reduce GHG emissions to a level that is less than significant. The California Natural Resources Agency (CNRA) adopted the CEQA Guidelines amendments in December 2009, which became effective in March 2010.

Under the amended CEQA Guidelines, a lead agency has the discretion to determine whether to use a quantitative or qualitative analysis or apply performance standards to determine the significance of GHG emissions resulting from a particular project (14 CCR 15064.4[a]). The CEQA Guidelines require a lead agency to consider the extent to which a project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]). The CEQA Guidelines also allow a lead agency to consider feasible means of mitigating the significant effects of GHG emissions, including reductions in emissions through the implementation of project features or off-site measures. The adopted amendments do not establish a GHG emission threshold, instead allowing a lead agency to develop, adopt, and apply its own thresholds of significance or those developed by other agencies or experts. The CNRA also acknowledges that a lead agency may consider compliance with regulations or requirements implementing AB 32 in determining the significance of a project's GHG emissions (CNRA 2009).

With respect to GHG emissions, the CEQA Guidelines, Section 15064.4(a), state that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines note that an agency may identify emissions by either selecting a "model or

methodology" to quantify the emissions or by relying on "qualitative analysis or other performance based standards" (14 CCR 15064.4[a]). Section 15064.4(b) states that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment: (1) the extent a project may increase or reduce GHG emissions as compared to the existing environmental setting; (2) whether project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which a project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]).

EO S-13-08

EO S-13-08 (November 2008) is intended to hasten California's response to the impacts of global climate change, particularly sea-level rise. Therefore, the EO directs state agencies to take specified actions to assess and plan for such impacts. The final 2009 California Climate Adaptation Strategy report was issued in December 2009 (CNRA 2009), and an update, Safeguarding California: Reducing Climate Risk, followed in July 2014 (CNRA 2014). To assess the state's vulnerability, the report summarizes key climate change impacts to the state for the following areas: agriculture, biodiversity and habitat, emergency management, energy, forestry, ocean and coastal ecosystems and resources, public health, transportation, and water. Issuance of the Safeguarding California: Implementation Action Plans followed in March 2016 (CNRA 2016). In January 2018, the CNRA released the Safeguarding California Plan: 2018 Update, which communicates current and needed actions that state government should take to build climate change resiliency (CNRA 2018).

3.6.2.3 Local

SBCAPCD and SBCAG

The Santa Barbara County Air Pollution Control District (SBCAPCD) is the regional agency responsible for the regulation and enforcement of federal, state, and local air pollution control regulations in the County. The SBCAPCD operates monitoring stations in the County, develops rules and regulations for stationary sources and equipment, prepares emissions inventory and air quality management planning documents, and conducts source testing and inspections. The SBCAPCD's focus is on criteria air pollutants to achieve California Ambient Air Quality Standards and National Ambient Air Quality Standards. It does not generally regulate sources of GHG emissions, except in its role as a reviewing agency for projects subject to CEQA.

SBCAG prepared a 2040 Regional Transportation Plan-Sustainable Communities Strategy (RTP-SCS), adopted in August 2017, which shows how the region will achieve the required GHG per capita emission targets as well the co-benefits of reducing criteria pollutants. The 2040 RTP-SCS is based on a preferred land use and transportation scenario, which lays out one possible pattern of future growth and transportation investment for the region. The 2040 RTP-SCS preferred scenario emphasizes a transit-oriented development and infill approach to land use and housing, supported by complementary transportation and transit investments. The 2040 RTP-SCS meets the requirements of SB 375 and successfully achieves the region's GHG emission targets in 2020 and 2035, while accommodating forecast growth and regional housing needs. The 2040 RTP-SCS would meet the SBCAG region's GHG emission targets from passenger vehicles for 2020 and 2035, achieving reductions in per capita emissions of CO_2 from passenger vehicles of 13.3% in 2020 and 17.7% in 2035, better than the SBCAG target of zero net growth in per capita emissions (SBCAG 2017).

County of Santa Barbara

CEQA Guidelines Section 15183.5(a) states,

> Lead agencies may analyze and mitigate the significant effects of GHG emissions at a programmatic level, such as in…a separate plan to reduce GHG emissions. Later project-specific environmental documents may tier from…that existing programmatic review…a lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project complies with the requirements in a previously adopted plan.

The County of Santa Barbara Board of Supervisors adopted the Energy and Climate Action Plan (ECAP) in May 2015 and certified the accompanying EIR (County of Santa Barbara 2015). The ECAP meets the criteria in CEQA Guidelines Section 15183.5(b) for a "plan to reduce GHG emissions." The ECAP commits the County to reduce community-wide GHG emissions by 15% below 2007 levels by 2020 consistent with the California Global Warming Solutions Act of 2006 (Assembly Bill 32) and the related Climate Change Scoping Plan (CARB 2008). The ECAP is a qualified GHG emissions reduction plan for projects built prior to 2020.

The County of Santa Barbara developed a Climate Action Strategy, which is a two-phase project comprised of (1) a Climate Action Study, and (2) an Energy and Climate Action Plan (ECAP). The Climate Action Strategy covers the unincorporated areas of Santa Barbara County where the County of Santa Barbara retains land use permit authority, which includes a portion of the proposed project. The County of Santa Barbara Long-Range Planning Division completed Phase 1 of the Climate Action Strategy, the Climate Action Study, in September 2011. The Climate Action Study provides a summary of policies, programs, and projects that the County of Santa Barbara can implement to reduce GHG emissions in the unincorporated County (County of Santa Barbara 2011). Phase 2, the ECAP, which seeks to reduce the County's GHG emissions through implementation of selected emission reduction measures with the goal of achieving the selected GHG reduction target, was adopted in May 2015 (County of Santa Barbara 2015). The E-CAP is currently being updated to incorporate the longer term GHG goals of the County, which are to reduce its emissions by 50% below 2007 levels by 2030 (County of Santa Barbara 2020).

City of Carpinteria

The City has adopted measures within its Open Space, Recreation & Conservation element of its General Plan to reduce GHG emissions (City of Carpinteria 2003). Measures identified within Section 3.2.2.3 for protecting air quality would also help to reduce GHG emissions. The following policies within that element in addition are included to reduce GHG emissions:

CDS6-f To ensure the efficient utilization of energy resources, design measures shall be incorporated into project design that allow for development projects to exceed the minimum energy requirements of the city's Uniform Codes.

1. Building orientation shall be designed to maximize natural lighting, passive solar heating, and cooling;
2. Landscaping shall be designed to maximize the use of native drought tolerant species and deciduous trees to shade buildings in summer and allow for passive solar heating in winter;
3. Energy efficient street lighting shall be used, with consideration of safety, visual impacts, and impacts to wildlife and sensitive habitat;

4. Design of parking facilities shall take into consideration the layout of entrances and exits so as to avoid concentrations of cars or excessive idling.
5. Alternatively fueled vehicles are to be used in construction and as fleet vehicles, if feasible and available.

C-7a Ensure that major businesses prepare and implement Transportation Systems Management Plans to achieve a reduction in the number of trips generated by their employees and operations by encouraging private sector program elements similar to the following:

- Preferential employee carpool/vanpool parking
- Work-at-home (telecommuting)
- Designation of Company Transportation Coordinator
- The construction of Transit Passenger Shelters (if located along an existing or designed transit route)
- Bus subsidies
- Transit operating subsidies
- Transit pass subsidies
- Buspool or shuttle bus programs
- Vanpool program
- Parking fees
- Showers, lockers and preferred bicycle parking
- Non-peak period shift schedules
- Flexible work hours offered to employees who rideshare
- Provision of luncheon/lounge seating area with vending machines and food preparation facilities
- Other programs and incentives which can feasibly and significantly reduce potential peak period trips.

C-7b Develop safe and direct pedestrian accessibility between residential areas, schools, parks, and shopping areas in both new and existing urban areas.

C-7c Provide safe mobility for the physically handicapped through the design of street improvements and public facilities.

C-7d Practice signal timing that is designed for the safe movement of the aged and the handicapped at locations where such needs exist.

C-7e Provide continuous sidewalks, where appropriate, for safe pedestrian circulation and consider creative alternatives for such issues.

C-7f Earmark a larger portion of development impact fees for alternative transportation programs.

C-7g Create a citywide campaign of prolonged duration promoting alternative transportation.

C-8a	Integrate the development of bicycle routes and pedestrian pathways in additional areas of the city, and encourage the utilization of such routes for commuting as well as recreational purposes.
C-8b	Provide adequate right-of-way and improvements for bicycle lanes, when called for in future street dedications.
C-8c	Provide or require safe and adequate bicycle parking at transportation centers, public parks, recreation areas and other nonresidential locations.
C-8d	Encourage integration of the city's bicycle routes with state and countywide programs.
C-8e	Encourage educational programs on bicycle safety, and complement such programs through bicycle law enforcement.
C-8f	Encourage pedestrian movement by providing pedestrian facilities that are direct and convenient, particularly in the beach and downtown areas.
C-8g	Consider rerouting the Pacific Coast Bikeway to another location parallel to the coastline, such as adjacent to the railroad right of way throughout the city. [5-year]
C-8h	Encourage a bike trail link from Carpinteria to Summerland along the railroad right of way and a coastal link to Ventura paralleling U.S. 101.
C-8i	Inspect, provide, and maintain contiguous bike lanes for a one-half mile radius around each school site.
C-8j	Encourage the School Board to instruct the School District to include bicycle safety as part of the curriculum.
C-8k	Contact the Carpinteria Chapter of the AHA and ask them to include the benefits of bicycling as part of their workplace training program. [2-year]
C-8l	As a requirement of new development, significant attention must be paid to bicycle-friendly infrastructure and the maintenance of nearby old infrastructure.
C-8m	Add more bike lanes to arterial street cross-sections.
C-8n	Develop funding sources for new bicycle infrastructure including diversion of funds from sources currently applied to single occupant vehicle infrastructure.
C-8o	Correct bike lanes at intersections, allowing for straight through bike lanes adjacent to auto lanes, when a right-turn lane exists.
C-8p	Correct pressure sensitive signals to respond to weight of bicyclists.
C-8q	Encourage the placement of bicycle lockers at shopping centers and major traffic areas.
C-8r	Encourage large employers to place bicycle lockers in convenient locations on their premises.

C-9a	Continue cooperation with the Santa Barbara Metropolitan Transit District (SBMTD), Caltrans and other transportation agencies, in order to assure that all City residents have adequate access to public transit as an alternative to the automobile.
C-9b	Develop the circulation system in a manner that will maximize route efficiency for transit lines within the city.
C-9c	Coordinate with SBMTD, Caltrans and other transportation agencies in the development of route systems and transfer points.
C-9d	Promote efficient and attractive public transit which maintains acceptable personal safety, and minimizes the disruption of neighbors attributable to transportation facilities and operations.
C-9e	Encourage privately owned transit systems to interface with the public transit systems.
C-9f	Encourage SBMTD and others to develop a variety of public transit modes and schedules coordinated with those of adjacent cities, while meeting residential and seasonal transit needs. Further, support development of a Ventura/Santa Barbara express bus commuter line with stops in Carpinteria.
C-9g	Continue cooperation with SBMTD to ensure frequent, predictable, safe and reliable neighborhood shuttle bus service.
C-9h	Encourage MTD to promote use of Parking Lot 3 as a park and ride lot, and encourage Caltrans to establish and promote its parcel southwest of the Bailard/Highway 101 interchange for a park and ride lot.
C-9i	Work with MTD to promote increased bus use and explore providing expanded inner city/neighborhood shuttle service within the city. [2-year]
C-9j	Encourage the growth of low impact and non-polluting industry, and promote improved congestion management techniques. This may take the form of local business ordinances and might be applied through the permitting process.
C-9k	Provide incentives to businesses that offer flexible shift/start times, compressed work week opportunities, and telecommuting options.
C-9l	Design and place improved signage for parking lots, sites of interest, business districts and recreational areas.
C-9m	Work with SBCAG's Traffic Solutions program to promote and educate citizens and employers about alternative transportation including bicycling, carpooling, vanpooling, buses, telecommuting, staggered start/stop times, compressed work weeks, and other alternatives as they are developed.
C-9n	Require new development plans to include significant attention to alternative modes of transportation.
C-9o	Require well-designed walkways as a condition to new development approval.
C-9p	Establish a regulatory framework for siting antennas and telecommunication equipment that protects visual resources. [2-year]

C-9q	Participate in countywide planning for telecommunications.
C-9r	Encourage local businesses to participate in electronic commerce.

3.6.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to greenhouse gas emissions are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to greenhouse gas emissions would occur if the project would:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The Appendix G thresholds for GHGs do not prescribe specific methodologies for performing an assessment, do not establish specific thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA (CNRA 2009). Additional guidance regarding assessment of GHGs is discussed below.

County of Santa Barbara

The County adopted the developing interim greenhouse gas (GHG) emissions thresholds to apply to new development projects while the County updates its Energy and Climate Action Plan (ECAP). The updated ECAP, now referred to as the 2030 Climate Action Plan (CAP), will identify reductions needed in both existing and new developments in the county to meet its 2030 GHG emissions reduction target. In July 2020, the County adopted a new target to reduce its emissions by 50% below 2007 levels by 2030 with direction from the Board of Supervisors (County of Santa Barbara 2020). The interim thresholds will help the County process discretionary projects under the California Environmental Quality Act (CEQA) and continue to achieve GHG emissions reductions from new development while it prepares the 2030 CAP.

The County Planning and Development Department developed the interim GHG emissions thresholds to assist project applicants to comply with the requirements of CEQA regarding potentially adverse impacts to climate change. The determination on whether or not a project may have a significant effect on the environment shall be based in part on the thresholds of significance. The proposed interim thresholds for GHG emissions are quantitative measures of environmental change. Thresholds of significance supplement provisions in the Guidelines for Implementation of the California Environmental Quality Act (CEQA Guidelines) for the determination of significant environmental effects, including Sections 15064, 15065, 15382, and Appendix G incorporated herein. The primary purpose of the interim GHG emissions thresholds is to provide a means to identify proposed local plans and development projects that may have a significant adverse effect related to GHGs. Subsequent sections of this memorandum present the justifications for the recommended interim GHG emissions thresholds. These changes were incorporated into the County's Environmental Thresholds and Guidelines Manual as amended on October 27, 2020 (County of Santa Barbara 2020).

The CEQA Guidelines address GHG emissions as a cumulative impact due to the global nature of climate change (14 CCR 15064.4[b]). As the California Supreme Court explained, "because of the global scale of climate change,

any one project's contribution is unlikely to be significant by itself" (Cleveland National Forest Foundation v. San Diego Assn. of Governments [2017] 3 Cal.5th 497, 512.). A project's significant GHG impacts must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact (14 CCR 15064.4[b] and 15183.5). Therefore, the impacts analysis of GHG emissions is global in nature and should be considered in a broader context. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions (14 CCR 15064.4[b]). The interim GHG emissions thresholds are set at a level of impact that identifies either (1) a cumulatively considerable contribution to an existing adverse condition, or (2) a cumulatively significant impact in combination with other projects causing related impacts.

The interim thresholds that apply to land use development projects, which include both project level residential and non-residential development and plans (e.g., specific plans and community plans). These thresholds would not apply to GHG-emitting power plants, oil and gas facilities, or other industrial stationary sources as the County has an adopted bright line threshold of 1,000 MT CO_2e per year for industrial stationary sources. The interim thresholds will only apply to non-exempt discretionary projects under CEQA. Under Step 1, applicants first compare non-exempt project applications against a screening threshold. Applicants can either qualitatively compare the project size to project screening criteria, or, if the screening criteria are not applicable, quantitatively calculate project-specific emissions (see Table 3 of the GHG memorandum). Examples of projects that may not be able to use project screening criteria include (1) project types not included in Table 3 of the GHG memorandum, or (2) projects that include emissions sources not accounted for in the modeled assumptions for the proposed land use type shown in Table 3 of the GHG memorandum. The screening threshold shall be no greater than 300 MT CO_2e per year, based on the estimated effectiveness of mitigation measures for new development. This threshold would result in approximately 15% of all applicable future projects and 87% of all applicable future land use emissions being subject to the efficiency threshold under Step 2. Under Step 2, any project with 2030 estimated emissions exceeding the screening threshold will be subject to an efficiency GHG emissions threshold based on the project's estimated service population. For projects exceeding the screening threshold, an efficiency threshold of 3.8 MT CO_2e/year per service population (SP) in 2030 will apply. Projects subject to the efficiency threshold amortize any construction emissions over the lifetime of the project (e.g., 30 years). The efficiency threshold would apply to the sum of the amortized construction emissions and the estimated annual operational emissions. Furthermore, until the 2030 CAP is adopted, the County considers projects or plans that have emissions below interim thresholds to be consistent with County GHG emission reduction plans. The interim thresholds are part of the County's GHG emissions reduction strategy and were informed by the County's 2030 target. The interim thresholds provide a pathway for projects and plans to show compliance with County goals (County of Santa Barbara 2020).

City of Carpinteria

The City does not have an adopted GHG threshold or qualified GHG reduction plan for the project to tier off. Therefore, the County of Santa Barbara's Interim GHG Threshold of 300 MT CO_2e per year will be applied to the project.

3.6.4 Impact Analysis

a) Would the project Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Construction Emissions

Construction of the project would result in GHG emissions that are primarily associated with use of off-road construction equipment, on-road vendor trucks, and worker vehicles. The County's Interim GHG Thresholds (County of Santa Barbara 2020) recommends the use of a 300 MT CO_2e bright-line threshold for both construction and operation of development projects.

CalEEMod was used to calculate the annual GHG emissions based on the construction scenario described in Section 3.2.4 and Appendix B. Construction of the proposed project is anticipated to commence in March 2022, lasting a total of approximately 24 months. On-site sources of GHG emissions include off-road equipment and off-site sources include on-road vehicles (haul trucks, vendor trucks, and worker vehicles). Table 3.6-4 below presents construction emissions for the project from on-site and off-site emissions sources.

Table 3.6-4. Estimated Annual Construction Greenhouse Gas Emissions

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
2022	522.46	0.08	0.00	524.56
2023	182.66	0.04	0.00	183.56
			Total	708.12
			Amortized Emissions over 30 years	23.60

Source: Appendix B.
Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent

As shown in Table 3.6-4, the estimated total GHG emissions during construction would be approximately 708 MT CO_2e. When construction emissions are amortized over 30 years, the construction emissions would be approximately 24 MT CO_2e per year. As with project-generated construction air quality pollutant emissions, GHG emissions generated during construction of the project would be short term in nature, lasting only for the duration of the construction period, and would not represent a long-term source of GHG emissions. As discussed in Section 3.6.3, Thresholds of Significance, the amortized construction emissions will be added to operational emissions and compared to the significance threshold.

Loss of Sequestered Carbon

The calculation methodology and default values provided in CalEEMod (CAPCOA 2017) were used to calculate potential CO_2 emissions associated with the one-time change in carbon sequestration capacity of a vegetation land use type. The calculation of the one-time loss of sequestered carbon is the product of the converted acreage value and the carbon content value for each land use type (vegetation community). The mass of sequestered carbon per unit area (expressed in units of MT of CO_2 per acre) is dependent on the specific land use type. Assuming that the

sequestered carbon is released as CO_2 after removal of the vegetation, annual CO_2 is calculated by multiplying total biomass (MT of dry matter per acre) from IPCC data by the carbon fraction in plant material, and then converting MT of carbon to MT of CO_2 based on the molecular weights of carbon and CO_2.

It is conservatively assumed that all sequestered carbon from the removed vegetation would be returned to the atmosphere; that is, the wood from the vegetation communities would not be re-used in a solid form or another form that would retain carbon. GHG emissions generated during construction activities, including clearing, vegetation removal, and grading, are estimated in the construction emissions analysis.

CalEEMod calculates GHG emissions resulting from land conversion and uses six[3] general IPCC land use classifications for assigning default carbon content values (in units of MT CO_2 per acre). CalEEMod default carbon content values were assumed to estimate the loss of sequestered carbon (release of CO_2) from the removal of the scrub (14.3 MT CO_2 per acre), forest (111 MT CO_2 per acre), and grassland (4.31 MT CO_2 per acre) vegetation categories, which are based on data and formulas provided in the IPCC reports. The project would permanently disturb 0.75 acres of scrub and temporarily disturb 9.95 acres of scrub as shown in Table 3.3-5 in Section 3.3, Biological Resources. As such, the project is estimated to result in 153.01 MT CO_2 through carbon loss.

When amortized over 30 years, this would result in annual carbon loss of 5.10 MT CO_2 per year. When added to the amortized construction emissions, the project would result in 28.70 MT CO_2e per year.

Operational Emissions

CalEEMod Version 2016.3.2 was used to estimate potential project-generated operational GHG emissions from area sources (landscape maintenance), mobile sources, solid waste, and water supply and wastewater treatment. Emissions from each category are discussed in the following text with respect to the project. See Section 3.2.4 for a discussion of operational emission calculation methodology and assumptions, specifically for area and mobile sources. Operational year 2024 was assumed as it is the first full year of operation following completion of construction.

Solid Waste

The project would generate solid waste and would, therefore, result in CO_2e emissions associated with landfill off-gassing. Solid waste generation was derived from the CalEEMod default rates for each land use type. Emission estimates associated with solid waste were estimated using CalEEMod. Trash and recycling cans would be provided in the existing dirt parking lot at the western trail terminus. Waste collection services would be provided by E. J. Harrison and Sons or other local service provider and would occur weekly. Existing trash and recycling cans located in Rincon Beach County Park at the eastern trail terminus would be available to serve the trail.

Water Supply and Wastewater

Water supplied to the project requires the use of electricity. Accordingly, the supply, conveyance, treatment, and distribution of water would indirectly result in GHG emissions through use of electricity. Annual water use for the project and GHG emissions associated with the electricity used for water supply were calculated based upon default water use estimates for each land-use type, as estimated by CalEEMod and Southern California

[3] Forest land (scrub), forest land (trees), cropland, grassland, wetlands, and other.

Edison factors. The water use would be associated with watering of landscaping around the trail. This is conservative as watering is only needed for the first couple of years to establish the plantings.

Emissions Estimates

CalEEMod was used to estimate potential project-generated operational GHG emissions from area sources (landscaping), mobile sources, solid waste, and water supply and wastewater treatment. Emissions from each category are discussed in the following text. Operational year 2024 was assumed as the first full year of operation upon construction completion. The projects estimated operational emissions are shown in Table 3.6-5.

Table 3.6-5. Estimated Annual Operational Greenhouse Gas Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Area	0.00	0.00	0.00	0.00
Mobile	0.17	0.00	0.00	0.17
Waste	0.03	0.00	0.00	0.06
Water	1.86	0.00	0.00	1.87
			Subtotal	*2.10*
			Amortized Construction Emissions over 30 Years	*23.60*
			Amortized Loss of Sequestered Carbon over 30 Years	*5.10*
			Total	**30.80**

Notes: CH_4 = methane; CO_2 = carbon dioxide; CO_2e = carbon dioxide equivalent; N_2O = nitrous oxide
See Appendix B for complete results.

As shown in Table 3.6-5, project GHG emissions generated from operational activities are estimated to be approximately 2 MT CO_2e per year in 2024. Total operational emissions combined with amortized construction emissions and vegetation removal would be 31 MT CO_2e per year, assuming a 30-year project life. As such, the total estimated emissions would be less than the County's bright-line significance threshold of 300 MT CO_2e per year. Therefore, impacts would be **less than significant**.

Consistency with GHG Reduction Plans

The Board adopted the ECAP in 2015 as the County's GHG emission reduction plan. The County has been implementing the ECAP since 2016 but is not projected to meet the plan's 2020 GHG emission reduction goals, according to the 2016 GHG Emissions Inventory Update and Forecast and the 2017 ECAP Progress Report. The final ECAP progress report will be released in 2021, using data through 2020. Until the 2030 CAP is adopted, the County considered projects or plans that have emissions below interim thresholds to be consistent with County GHG emission reduction plans. The interim thresholds are part of the County's GHG emissions reduction strategy and were informed by the County's 2030 target. The interim thresholds provide a pathway for projects and plans to show compliance with County goals and State GHG Reduction Plans, Policies, and Regulations. The Board's 2030 GHG emission reduction goal (50% reduction from 2007 levels by the year 2030) is consistent with the state's direction under Senate Bill 32 as codified in the California Health and Safety Code, Division 25.5, Part 4, Section 38566 (40% reduction below 1990 levels by 2030). CARB's 2017 Scoping Plan (CARB 2017) describes the state's strategy for achieving California's 2030 GHG emission reduction target. The 2017 Scoping Plan does not prescribe or require specific actions by local government agencies; rather, the Scoping Plan provides guidance to local agencies and CARB supports programs that assist local agencies. Local

government efforts to reduce emissions within their jurisdiction are critical to achieving the state's long term GHG goals, and can also provide important co-benefits, such as improved air quality, local economic benefits, more sustainable communities, and an improved quality of life. CARB recommends statewide targets of no more than 6 MT CO_2e per capita by 2030, and no more than 2 MT CO_2e per capita by 2050. The statewide per capita targets account for all emissions sectors in the state, statewide population forecasts, and the statewide reductions necessary to achieve the 2030 statewide target under SB 32 and the longer-term state emissions reduction goal of 80% below 1990 levels by 2050. This limit represents California's and these other governments' recognition of their "fair share" to reduce GHG emissions to the scientifically based levels to limit global warming below 2°C.

CARB recommends that local governments evaluate and adopt robust and quantitative locally-appropriate goals that align with the statewide per capita targets and the state's sustainable development objectives and develop plans to achieve the local goals. The County's interim GHG emission efficiency threshold is considerably lower than the state's 2030 per capita target. Therefore, analysts can apply the County's interim threshold with confidence that it aids the state in achieving its target, as well.

As shown, the emissions would be less than the County's bright-line threshold of 300 MT CO_2e per year. Therefore, the project would have a **less than significant** impact.

3.6.5 Mitigation

No mitigation measures would be required. However, **Mitigation Measure (MM) BIO-3** requires temporarily impacted vegetated areas shall be restored on site at a 1:1 ratio. Any remaining on-site mitigation potential (in disturbed land/disturbed areas or developed areas) shall be restored at a ratio of 2:1 for coastal sage scrub and coastal bluff scrub permanently removed on site. This mitigation would require additional plantings to offset the impacted species identified in Table 3.3-5.

3.6.6 Level of Significance After Mitigation

Sequestered Carbon

CalEEMod calculates GHG emissions resulting from land conversion and uses six[4] general IPCC land use classifications for assigning default carbon content values (in units of MT CO_2 per acre). CalEEMod default carbon content values were assumed to estimate the loss of sequestered carbon (release of CO_2) from the removal of the scrub (14.3 MT CO_2 per acre), forest (111 MT CO_2 per acre), and grassland (4.31 MT CO_2 per acre) vegetation categories, which are based on data and formulas provided in the IPCC reports. In accordance with **MM-BIO-3**, the project must restore temporarily vegetated areas at a 1:1 ratio and permanently removed scrub will be restored at a 2:1 ratio. This would result in a total of 11.45 acres of scrub to be replaced in accordance with **MM-BIO-3**. This would result in the sequestration of 163.74 MT CO_2, or 5.46 MT CO_2 per year when amortized over 30 years. The project's operational emissions plus amortized construction emissions, vegetation removal, and carbon sequestration would result in emissions of 25.34 MT CO_2e per year. This would still be less than the County's significance threshold. Impacts would remain less than significant.

[4] Forest land (scrub), forest land (trees), cropland, grassland, wetlands, and other.

INTENTIONALLY LEFT BLANK

3.7 Hazards and Hazardous Materials

This section describes the hazards and hazardous materials conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project.

3.7.1 Existing Conditions

Hazardous materials occur in every community, in relation to residential, commercial, industry, medical practices, research, transportation, construction, and other uses. As a result of natural events, system failures, and accidents (spills), hazardous materials have the potential to pose a risk to the environment and human health. A multitude of local, state, and federals laws exist to regulate the storage, use, handling, transportation and disposal of hazardous materials. To ensure public safety and heighten awareness of hazardous materials exposure risk, businesses and other entities that handle, store, transport, or use hazardous materials are required to file reports with appropriate authorities and maintain emergency response plans in the event of a hazardous materials release.

Dudek performed a regulatory agency records search for the project site and vicinity using the State Water Resources Control Board (SWRCB) GeoTracker database (SWRCB 2021) and the California Department of Toxic Substances Control (DTSC) EnviroStor database (DTSC 2021). These lists are a compilation of information from various sources listing potential and confirmed hazardous waste and hazardous substances sites in California. There are no sites of potential concern listed on the DTSC EnviroStor database within 1 mile of the project site. There are also no potential sites with environmental concern listed on the SWRCB GeoTracker database within 0.25 miles of the project site; the only listed site within a quarter mile is a closed case on the opposite side of the freeway, approximately 850 feet north of the eastern terminus of the trail. Appendix F includes the EnviroStor and GeoTracker database maps of hazardous sites in the vicinity of the Study Area. The closest DTSC-listed sites include:

- Rincon del Mar Ranch – Bates Road (approximately 850 feet northeast of the eastern trail terminus). The case involved the spill of petroleum products, for which no remediation was required; case closed.
- Infrared Industries – 6307 Carpinteria Avenue (approximately 0.5 miles west of the western trail terminus) The case involved the release of TCE (solvent) to soil and shallow groundwater from an underground tank; the tank was removed along with contaminated soil, TCE concentrations in groundwater were below action levels; case closed.
- Vacant Lot – 6185 Carpinteria Avenue (approximately 0.75 miles west of the western trail terminus). There are no specifics provided for this case, but since it is a vacant lot it may have involved illegal dumping. No remediation was required for the incident, and the case was closed.
- Conoco Phillips Kittie Ballard Well Site (approximately 1 mile west of the western trail terminus). This case involved reported oil seeps from a previously abandoned oil well. The well was re-abandoned to current DOGGR standards in 2011, case closed.

As such, the project site has no known history of illicit dumping, oil well drilling, or release of hazardous materials, and has been highly engineered and extensively disturbed related to construction of US Highway 101 and the UPRR. Because the northern trail area (northward of the UPRR) is adjacent to US Highway 101, aerially deposited lead could occur in shallow soils, from the historic presence of lead as a gasoline additive affecting vehicle operations within the US Highway 101 alignment. No other hazardous waste or contaminants are anticipated to be present within the proposed Rincon Trail alignment.

3.7.2 Relevant Plans, Policies, and Ordinances

3.7.2.1 Federal

Resource Conservation and Recovery Act of 1976, as amended by the Hazardous and Solid Waste Amendments of 1984

Federal hazardous waste laws are generally promulgated under the Resource Conservation and Recovery Act (RCRA). These laws provide for the "cradle to grave" regulation of hazardous wastes. Any business, institution, or other entity that generates hazardous waste is required to identify and track its hazardous waste from the point of generation until it is recycled, reused, or disposed. The Department of Toxic Substances Control (DTSC) is responsible for implementing the RCRA program as well as California's own hazardous waste laws, which are collectively known as the Hazardous Waste Control Law.

Comprehensive Environmental Response, Compensation, and Liability Act and the Superfund Amendments and Reauthorization Act of 1986

Congress enacted the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), also known as Superfund, on December 11, 1980. CERCLA established prohibitions and requirements concerning closed and abandoned hazardous waste sites; provided for liability of persons responsible for releases of hazardous waste at these sites; and established a trust fund to provide for cleanup when no responsible party could be identified. The Superfund Amendments and Reauthorization Act (SARA) amended the CERCLA on October 17, 1986. SARA stressed the importance of permanent remedies and innovative treatment technologies in cleaning up hazardous waste sites; required Superfund actions to consider the standards and requirements found in other state and federal environmental laws and regulations; provided new enforcement authorities and settlement tools; increased state involvement in every phase of the Superfund program; increased the focus on human health problems posed by hazardous waste sites; encouraged greater citizen participation in making decisions on how sites should be cleaned up; and increased the size of the trust fund to $8.5 billion.

Emergency Planning Community Right-to-Know Act

The Emergency Planning Community Right-to-Know Act, also known as SARA Title III, was enacted in October 1986. This law requires any infrastructure at the state and local levels to plan for chemical emergencies. Reported information is then made publicly available so that interested parties may become informed about potentially dangerous chemicals in their community. Sections 301 through 312 of the Act are administered by EPA's Office of Emergency Management. EPA's Office of Information Analysis and Access implements the SARA Title III Section 313 program. In California, SARA Title III is implemented through the California Accidental Release Prevention Program (CalARP). As the Certified Unified Program Agency (CUPA) for the majority of the County, the Santa Barbara County Public Health Department, Environmental Health Services implements the CalARP program.

Hazardous Materials Transportation Act

The U.S. Department of Transportation regulates hazardous materials transportation under Title 49 of the Code of Federal Regulations, the Hazardous Materials Transportation Act. State agencies with primary responsibility for enforcing federal and state regulations and responding to hazardous materials transportation emergencies are the California Highway Patrol and Caltrans. These agencies also govern permitting for hazardous materials transportation. The Hazardous Materials Transportation Act reflects laws passed by Congress as of January 2, 2006.

EPA Regional Screening Levels

The federal EPA provides regional screening levels for chemical contaminants to provide comparison values for residential and commercial/industrial exposures to soil, air, and tap water (drinking water). Residential Screening Levels (RSLs) are available on the EPA's website and provide a screening level calculation tool to assist risk assessors, remediation project managers, and others involved with risk assessment and decision making. RSLs are also used when a site is initially investigated to determine if potentially significant levels of contamination are present to warrant further investigation. In California, the Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (HERO) incorporated the EPA RSLs into the HERO human health risk assessment. HERO created Human Health Risk Assessment (HHRA) Note 3, which incorporates HERO recommendations and DTSC-modified screening levels (DTSC-SLs) based on review of the EPA RSLs. The DTSC-SL should be used in conjunction with the EPA RSLs to evaluate chemical concentrations in environmental media at California sites and facilities.

The Robert T. Stafford Disaster Relief and Emergency Assistance Act, as Amended, and Related Authorities

The Robert T. Stafford Disaster Relief and Emergency Assistance Act (Public Law 93-288), as amended (42 USC 5121–5206), and implementing regulations (Code of Federal Regulations, Title 44, Sections 206.31–206.48) provide the statutory framework for a presidential declaration of an emergency or a declaration of a major disaster. Such declarations open the way for a wide range of federal resources to be made available to assist in dealing with an emergency or major disaster. The Stafford Act structure for the declaration process reflects the fact that federal resources under this act supplement state and local resources for disaster relief and recovery. Except in the case of an emergency involving a subject area that is exclusively or preeminently in the federal purview, the governor of an affected state, or acting governor if the governor is not available, must request such a declaration by the president.

Federal Response Plan

The Federal Response Plan of 1999 is a signed agreement among 27 federal departments and agencies, including the American Red Cross, that: (1) provides the mechanism for coordinating delivery of federal assistance and resources to augment efforts of state and local governments overwhelmed by a major disaster or emergency; (2) supports implementation of the Stafford Act, as well as individual agency statutory authorities; and (3) supplements other federal emergency operations plans developed to address specific hazards. The Federal Response Plan is implemented in anticipation of a significant event likely to result in a need for federal assistance or in response to an actual event requiring federal assistance under a Presidential declaration of a major disaster or emergency.

3.7.2.2 State

Government Code Section 65962.5(a), Cortese List

The Hazardous Waste and Substance Sites Cortese List is a planning document used by the state, local agencies, and developers to comply with CEQA requirements in providing information about the location of hazardous materials release sites. Government Code Section 65962.5 requires the CalEPA to develop at least annually an updated Cortese List. DTSC is responsible for a portion of the information contained in the Cortese List. Other state and local government agencies are required to provide additional hazardous material release information for the Cortese List.

California Unified Program for Management of Hazardous Waste and Materials

California Health and Safety Code (HSC), Division 20, Chapter 6.11, Sections 25404- 25404.9 Sections– Unified Hazardous Waste and Hazardous Materials Management Regulatory Program

Under the California Environmental Protection Agency (CalEPA), the Department of Toxic Substances Control (DTSC) and Enforcement and Emergency Response Program (EERP) administer the technical implementation of California's Unified Program, which consolidates the administration, permit, inspection, and enforcement activities of several environmental and emergency management programs at the local level (CalEPA 2021). Certified Unified Program Agencies (CUPAs) implement the hazardous waste and materials standards. This program was established under the amendments to the California HSC made by SB 1082 in 1994. The CUPA for the project area is the Santa Barbara County Public Health Department, Environmental Health Services.

Hazardous Waste Control Law

The DTSC regulates the generation, transportation, treatment, storage and disposal of hazardous waste under RCRA and the California Hazardous Waste Control Law (22 CCR 6.5). Both laws impose "cradle to grave" regulatory systems for handling hazardous waste in a manner that protects human health and the environment. CalEPA has delegated some of its authority under the Hazardous Waste Control Law to county health departments and other CUPAs.

Aboveground and Underground Petroleum Storage Tanks

Title 22 California HSC, Division 20, Chapter 6.67, Sections 25270 to 25270.13 – Aboveground Petroleum Storage Act

This law applies if a facility is subject to Spill Prevention, Control and Countermeasure (SPCC) regulations under Title 40 U.S.C. Part 112, or if the facility has 10,000 gallons or more of petroleum in any or combination of Aboveground Storage Tanks (ASTs) and connecting pipes. If a facility exceeds these criteria, it must prepare a SPCC plan.

Low-Threat Underground Storage Tank (UST) Case Closure Policy

This policy applies to petroleum Underground Storage Tank (UST) sites subject to Chapter 6.7 of the Health and Safety Code. This policy establishes both general and media-specific criteria. If both the general and applicable media-specific criteria are satisfied, then the leaking UST case is generally considered to present a low threat to human health, safety and the environment. This policy recognizes, however, that even if all of the specified criteria in the policy are met, there may be unique attributes of the case or site-specific conditions that increase the risk associated with the residual petroleum constituents. In these cases, the regulatory agency overseeing corrective action at the site must identify the conditions that make case closure under the policy inappropriate.

Regional Water Boards and local agencies have been directed to review all cases in the petroleum UST Cleanup Program using the framework provided in this policy. These case reviews shall, at a minimum, include the following for each UST case:

1. Determination of whether or not each UST case meets the criteria in this policy or is otherwise appropriate for closure based on a site-specific analysis.
2. If the case does not satisfy the criteria in this policy or does not present a low-risk based upon a site-specific analysis, impediments to closure shall be identified.
3. Each case review shall be made publicly available on the State Water Resources Control Board's GeoTracker web site in a format acceptable to the Executive Director.

Title 27 of the California Code of Regulations, Solid Waste

Title 27 of the California Code of Regulations contains a waste classification system that applies to solid wastes that cannot be discharged directly or indirectly to waters of the state and which therefore must be discharged to waste management sites for treatment, storage, or disposal (27 CCR 2).

Human Health Risk Assessment Note 3 –DTSC-Modified Screening Levels (DTSC-SLs)

Human Health Risk Assessment (HHRA) Note Number 3 presents recommended screening levels (derived from the EPA RSLs using DTSC-modified exposure and toxicity factors) for constituents in soil, tap water, and ambient air. The DTSC-SL should be used in conjunction with the EPA RSLs to evaluate chemical concentrations in environmental media at California sites and facilities.

Environmental Cleanup Levels

Environmental Screening Levels (ESLs) provide conservative screening levels for over 100 chemicals found at sites with contaminated soil and groundwater. They are intended to help expedite the identification and evaluation of potential environmental concerns at contaminated sites. The ESLs were developed by staff at the San Francisco Bay Regional Water Quality Control Board; however, they are used throughout the state. While ESLs are not intended to establish policy or regulation, they can be used as a conservative screening level for sites with contamination. Other agencies in California currently use the ESLs (as opposed to RSLs). In general, the ESLs could be used at any site in the State of California, provided all stakeholders agree (SFBRWQCB 2020). In recent experience, regulatory agencies in various regions use ESLs as regulatory cleanup levels. The ESLs are not generally used at sites where the contamination is solely related to a leaking underground storage tank (LUST); those sites are instead subject to the Low-Threat Underground Storage Tank Closure Policy.

Senate Bill 1889, Accidental Release Prevention Law/CalARP Program

Senate Bill 1889 required California to implement a new federally mandated program governing the accidental airborne release of chemicals promulgated under Section 112 of the Clean Air Act. Effective January 1, 1997, CalARP replaced the previous California Risk Management and Prevention Program and incorporated the mandatory federal requirements. CalARP addresses facilities that contain specified hazardous materials, known as “regulated substances” that, if involved in an accidental release, could result in adverse off-site consequences. CalARP defines regulated substances as chemicals that pose a threat to public health and safety or the environment because they are highly toxic, flammable, or explosive.

Emergency Response to Hazardous Materials Incidents

California has developed an Emergency Response Plan to coordinate emergency services provided by federal, state, and local government, and private agencies. The plan is administered by Governor’s Office of Emergency Services (CalOES) and includes response to hazardous materials incidents. The CalOES coordinates the response of other agencies, including CalEPA, California Highway Patrol, California Department of Fish and Wildlife, and Regional Water Quality Control Board.

California Fire Code

The California Fire Code (CFC) is Chapter 9 of Title 24 of the California Code of Regulations. It is created by the California Building Standards Commission and it is based on the International Fire Code (IFC) created by the

International Code Council. It is the primary means for authorizing and enforcing procedures and mechanisms to ensure the safe handling and storage of any substance that may pose a threat to public health and safety. The CFC regulates the use, handling, and storage requirements for hazardous materials at fixed facilities. The CFC and the California Building Code use a hazard classification system to determine what protective measures are required to protect fire and life safety. These measures may include construction standards, separations from property lines, and specialized equipment. To ensure that these safety measures are met, the CFC employs a permit system based on hazard classification. The CFC is updated every 3 years.

California Emergency Services Act

This Act was adopted to establish the state's roles and responsibilities during human-made or natural emergencies that result in conditions of disaster and/or extreme peril to life, property, or the resources of the state. This Act is intended to protect health and safety by preserving the lives and property of the people of the state.

California Natural Disaster Assistance Act

The California Natural Disaster Assistance Act provides financial aid to local agencies to assist in the permanent restoration of public real property, other than facilities used solely for recreational purposes, when such real property has been damaged or destroyed by a natural disaster. The act is activated after the following occurs: (1) a local declaration of emergency; or (2) the CalEMA gives concurrence with the local declaration, or the Governor issues a Proclamation of a State Emergency. Once the Natural Disaster Assistance Act is activated, local government is eligible for certain types of assistance, depending upon the specific declaration or proclamation issued.

Title 14, Division 1.5 of the California Code of Regulations

California Code of Regulations, Title 14, Division 1.5 establishes the regulations for the California Department of Forestry and Fire Protection (CAL FIRE) and is applicable in all State Responsibility Areas (SRAs)—areas where CAL FIRE is responsible for wildfire protection. Any development in SRAs must comply with these regulations. Among other things, Title 14 establishes minimum standards for emergency access, fuel modification, setbacks to property line, signage, and water supply.

California Public Resources Code Sections 4201–4204

These sections of the California Public Resources Code require the California Department of Forestry to classify all SRAs into Fire Hazard Severity Zones. The purpose of this code is to provide classification of lands within SRAs in accordance with the severity of fire hazard present for the purpose of identifying measures to retard the rate of spreading and to reduce the potential intensity of uncontrolled fires that threaten to destroy resources, life, or property.

3.7.2.3 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan

The Safety Element of the General Plan/Local Coastal Land Use Plan (City of Carpinteria 2003) addresses physical hazards related to earthquakes, fire, flooding, hazardous material uses and transportation, soil and slope stability hazards.

Objective S-6 Minimize the potential risks and reduce the loss of life, property and the economic and social dislocations resulting from hazardous materials accidents at large industrial facilities, at facilities handling acutely hazardous materials, and along transportation corridors.

S-6a The City should maintain lists of facilities in the planning area that involve the use, storage, and/or transportation of hazardous materials.

S-6b City policies concerning the use, storage, transportation and disposal of hazardous materials, and regarding underground or above-ground storage tanks shall reflect the County of Santa Barbara and the State Regional Water Quality Control Board policies and requirements and shall ensure that the use, storage, transportation and disposal of hazardous materials does not result in hazardous discharge or runoff.

S-6c The City should consider the presence of large industrial facilities, facilities that handle acutely hazardous materials or pesticides, and railroad and utilities right-of-ways in land use planning.

S-6d The City shall support protective measures against the spillage of hazardous materials, including crude oil, gas and petroleum products, and shall support effective containment and cleanup facilities and procedures for accidental spills that occur.

S-6e Where feasible, new hazardous industrial development shall be located away from existing developed areas.

Santa Barbara County Comprehensive Plan – Hazardous Waste Element

The Hazardous Waste Element of the Santa Barbara County Comprehensive Plan (County of Santa Barbara 2009) provides goals and policies for hazardous waste generated within the County. Goals and policies that could be considered applicable to the proposed project include materials storage and contaminated sites, as presented below.

Goal 9-1 To protect the public health and safety and the environment from risks posed by improper storage of hazardous materials and hazardous waste.

Policies **9-1** The County and cities shall encourage the proper storage of hazardous materials and hazardous waste through continued inspection efforts and public education regarding proper storage methods and regulations.

Goal 10-1 To protect public health and safety and the environment from risks due to the presence of abandoned or contaminated sites.

Policies **10-1** The County and cities should work with other involved agencies to establish a coordinated interagency effort for identification, regulation, mitigation, and notification of contaminated sites.

10-2 The County and cities in conjunction with the State Department of Health Services shall encourage on-site treatment and remediation to reduce the transport of hazardous waste from contaminated sites.

3.7.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to hazards and hazardous materials are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to hazards and hazardous materials would occur if the project would:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous material.
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area.
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.
g) Result in cumulatively considerable impacts to hazards and hazardous materials.
h) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

3.7.4 Impact Analysis

The following analysis of potential project impacts is provided, based upon each of the above identified significance thresholds.

a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous material?

The use/operation of the proposed shared-use path and trail amenities would not involve the use of, nor generate, hazardous materials. Therefore, no impacts with regard to the transport, use, accidental release or disposal of hazardous materials would occur. **No impact** would occur*.*

b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction of the proposed project would require heavy construction equipment, which involves the use of hydrocarbon fuels and lubricants that are considered hazardous materials, Concrete is considered a hazardous material until it cures, and is included in the project construction. Paint or other surface coatings are also considered hazardous materials, until they are fully dried; the bridge and certain fencing elements may involve paint application on site. During construction, hydrocarbon fuels and lubricants, paints and concrete may inadvertently enter the stormwater drainage system. A Storm Water Pollution Prevention Plan (SWPPP) covering

water quality protection during the construction phase of the project would be required to be prepared and implemented by the applicant pursuant to the National Pollutant Discharge Elimination System (NPDES) State Construction Activities Storm Water General Permit.. Accordingly, project hazardous materials impacts upon water quality from accidental releases during construction could be potentially significant. **Mitigation Measure (MM) WAT-2** would reduce impacts to **less than significant with mitigation.**

c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

No existing or proposed public schools are located within a quarter mile of the project site. Additionally, no hazardous materials would be kept on site once the proposed project is operational. Therefore, there would be no impact to adjacent schools from the use or handling of any hazardous materials on the project site. **No impact** would occur.

d) Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

The project site is not included on a list of hazardous materials sites (refer to Section 3.7.1, Existing Conditions). Therefore, the project does not have the potential to expose people to a significant risk as a result of a known hazardous materials site. However, the northern portion of the trail alignment is immediately adjacent to the US Highway 101 alignment, and therefore aerially deposited lead (ADL) could occur in shallow soils, from the historic presence of lead as a gasoline additive affecting vehicle operations within the US Highway 101 alignment. Because of proposed grading for the trail, surface soils that could potentially contain ADL are likely to be removed, and transported off the site. However, some soils containing ADL could be used as fill for the project, or could be used off site as fill in areas where the public could have exposure to the soils. Consequently, impacts from ADL containing soil could be potentially significant. **MM-HAZ-1** would reduce impacts to **less than significant with mitigation**.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

The project site is not located within the airport land use plan for any public use airport and is also not within two miles of a public airport. The closest public airport to the project site is the Santa Barbara municipal airport, located approximately 30 miles to the northwest. **No impact** would occur.

f) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

The proposed project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Access to the proposed trail would be provided via the existing unimproved parking lot at the western end of the trail that connects to Carpinteria Avenue and also at Rincon Beach County Park from Bates Road, both of which are public streets that could be accessed by emergency vehicles and personnel. The Carpinteria-Summerland Fire Protection District will review the proposed project to ensure no interference with emergency response or evacuation would occur during construction, as potentially related to truck traffic on area roadways. The proposed project is designed to correct unsafe conditions such

as those that exist in the current alignment of the Pacific Coast Bikeway along US Highway 101 and the common practice of trespassing along the railroad corridor to access Rincon Beach County Park from the City of Carpinteria, thereby, reducing potential emergency events. Consequently, **no impact** would occur.

g) Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

According to the City of Carpinteria's General Plan/Coastal Plan Fire Hazards Zones Map, the project alignment is located within a moderate fire hazard area (City of Carpinteria 2003). According to the Santa Barbara County's Fire Protection Districts, High Fire Hazard Areas and Flood Hazard Areas Map, the proposed project is not located within a fire hazard area (County of Santa Barbara 2017. The proposed project would not involve the construction of buildings or introduce substantial numbers of people into the area. The proposed project is designed to prevent unwarranted fire hazards to the land and public safety through vegetation control and use of native plant species along the alignment and within the proposed parking area. **No impact** would occur.

h) Would the project result in cumulatively considerable impacts to hazards and hazardous materials?

Cumulative development throughout the Carpinteria Valley would incrementally contribute to hazardous materials/safety impacts. However, based on the analysis above, and with adherence to applicable Objectives and Policies found in the City and County's General Plan/Local Coastal Land Use Plans, the project with required mitigation incorporated is not expected to result in any site-specific public health risk or hazard. The project's contribution to cumulative hazards impacts would not be considerable.

3.7.5 Mitigation

The project would require the implementation of **Mitigation Measure (MM) HAZ-1** to reduce impacts from the potential exposure of the public to soils containing aerially deposited lead. The project would also require the implementation of **MM-WAT-2** (refer to Section 3.8, Hydrology and Water Quality) to reduce impacts upon surface water quality from accidental release of hazardous materials during construction.

Required Mitigation Measures

MM-HAZ-1 Aerially Deposited Lead (ADL). Surface soils within the trail alignment segment north of the UPRR corridor shall be tested for potential ADL presence to determine if such soils may be used as fill, or must be disposed in a properly licensed landfill. Using the risk based screening levels developed by California Office of Environmental Health Hazard Assessment (OEHHA), excavated soils with a lead concentration less than or equal to 80 mg/kg total lead (analyzed by USEPA Method 6010 or 6020) would be acceptable for reuse without restrictions, including as fill material within the Rincon Trail project. Excavated soils that are considered a California hazardous waste (total lead concentration greater than or equal to 1,000 mg/kg or a soluble lead concentration greater than or equal to 5 milligrams per liter [mg/L] as determined by the California Waste Extraction Test [CAWet]) or are a RCRA hazardous waste and must be disposed of in a Class I hazardous waste landfill. Excavated soils with lead concentrations below 1,000 mg/kg but above 80 mg/kg total lead may be eligible for reuse with specific restrictions to reduce or eliminate exposure, with prior written approval from DTSC, or may be disposed of at an appropriately permitted landfill.

Plan Requirements: ADL testing requirements and soil re-use restrictions according to identified ADL concentration shall be shown on grading and building plans. Since excess soil material would be generated through proposed grading activities, soils containing greater than 80 mg/kg total lead shall

not be used as fill material for the project but shall be exported off site. Soil containing total lead greater than 1,000 mg/kg shall be disposed in a Class I hazardous waste landfill. ***Timing***: Condition shall be adhered to throughout all grading and construction activities. ***Monitoring***: City of Carpinteria and County staff shall ensure measures are on plans. City and County Grading Inspectors shall spot check and ensure compliance on site.

3.7.6 Level of Significance After Mitigation

With incorporation of **MM-HAZ-1** to address the potential for ADL to be present in shallow soils, and incorporation of **MM-WAT-2** (refer to Section 3.8) to reduce impacts upon surface water quality from accidental release of hazardous materials during construction, residual impacts related to hazardous materials would be less than significant.

INTENTIONALLY LEFT BLANK

3.8 Hydrology and Water Quality

This section describes the hydrology and water quality conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project. This section is based partially upon a drainage analysis prepared by Bengal Engineers, Drainage System Feasibility Discussion: The Rincon Multi-Use Trail, City of Carpinteria, which is included as Appendix G of this Environmental Impact Report.

3.8.1 Existing Conditions

Surface Drainage / Storm Water Run-off

The proposed trail route is located along areas that have been subject to fill placement, abandoned roadways, or old terraced road and rail cuts; the trail would be exclusively located within area that has been subject to artificial landform modification over the years. Please refer to Section 3.5 (Geology & Soils) for a detailed description of landform modification that has occurred within the trail alignment. A small unsanctioned trail exists in some areas of the proposed trail, including the portion of the proposed trail from the railroad crossing to the Rincon Beach County Park parking lot. At both ends of the trail are pre-existing parking areas; Rincon Beach County Park has a paved lot and at Carpinteria Avenue there is an existing dirt lot which would continue to provide informal parking for the proposed project.

The proposed Carpinteria Avenue trail head and parking lot is currently unimproved with an area crowned in the approximate center of the lot for drainage purposes. It is anticipated that the majority of the storm water runoff from the lot enters Highway 150, and then drains onto the southbound freeway on ramp and ultimately collects into the freeway drainage system; drainage from this freeway sub-area is currently conveyed by a storm drain which outlets at the beach. The remaining runoff likely enters Carpinteria Avenue and drains to the southern edge curb line, then west until it enters at a drop inlet located within the curb.

The Rincon Beach County Park parking lot has three visible drainage points. An infiltration area is located along the south side of the parking lot and serves the westernmost portion of the parking area, although most of the runoff from this area enters a drop inlet located at the western terminus of the parking area, which continues draining to the beach below. The eastern portion of the parking area drains from the County property onto Bates Road, where it enters a drop inlet located just north of the park entrance on the west side of the road, and likely into Rincon Creek through the existing storm drain system.

The majority of the length of proposed trail is outside of the City of Carpinteria's and Santa Barbara County's respective 2013 Statewide Phase II Small Municipal Separate Storm Sewer (MS4) General Permit (2013 General Permit) boundaries, and thus the majority of the project is exempt from the Post Construction Requirements (PCRs) of the 2013 General Permit. Because the project is not regulated by the 2013 General Permit and PCRs therein, the project may not fully avoid potential water quality impacts unless it achieves compliance with active construction and post-construction requirements of the Statewide Construction General Permit (CGP).

Flooding

The proposed alignment is not located within a 100-year flood hazard zone (FEMA 2019), nor is it within a Tsunami Inundation Zone (CDOC 2009).

Sea Level Rise (SLR)

Sea level rise is anticipated to occur because of an increase in the average oceanic temperatures globally, leading to the melting of polar ice caps. Some of the negative effects of sea level rise include flooding of low elevation areas that are currently above mean sea level, and increased erosion rates within areas along the ocean. The release of greenhouse gas (GHG) emissions is a key factor in the potential warming of the atmosphere and ocean temperature increases, and therefore projections of sea level rise rely heavily upon the predicted GHG emissions in the coming decades, on a world-wide basis. This methodology has led to the identification of a range for the possible elevation increases of sea levels at future reference time periods. For the local region, the issue of sea level rise has been addressed in several studies including *2017 Santa Barbara County Multi-Jurisdictional Hazard Mitigation Plan* and *City of Carpinteria's Sea Level Rise Vulnerability Assessment* (SLRVA) (Carpinteria 2019).

The above studies of local sea rise potential identify a low, medium, high and extreme (worst-case highest) increase in sea level for the planning year horizons of 2030, 2060, and 2100, which are based upon the range for global GHG emissions in the same target years. Table 3.8-1 summarizes the sea level elevation increases using the "high GHG emissions" scenario for each target year.

Table 3.8-1. Sea Level Rise Projections for Carpinteria Coastline

Projected Horizon Year/Time	Sea Level Rise (inches/feet)	Probability of Occurring in Projected Year [1]
2030	10.2 inches/ ~1 foot	<0.5%
2060	27.2 inches/ ~2 feet	~2%
2100	60.2 inches/ ~5 feet	~2%

Source: City of Carpinteria 2019.

[1] The range of probabilities relate to scenarios in future greenhouse gas (GHG) emissions as well as sea level rise uncertainties largely associated with the rate of global ice sheet melt.

The range in predicted sea level rise for Year 2100 is a low of 2 feet up to an extreme (worst-case) of 10 feet (Carpinteria 2019). Using the "high GHG emissions" scenario, the Carpinteria SLRVA mapped the extent of sea level rise hazard for each of the target assessment years. The portion of the proposed Carpinteria Rincon Trail on the north side of the UPRR alignment is located outside of the sea level rise hazard zone through Year 2100. The portion of the proposed Carpinteria Rincon Trail on the south side of the UPRR alignment is located right at the boundary of the Year 2030 / Year 2060 hazard zones (Carpinteria 2019). The County of Santa Barbara sea level rise mapping is not as detailed but indicates that the Rincon Beach County Park facilities could be inundated by approximately Year 2060 (Santa Barbara County 2017). The 2100 hazard zone boundary extends up from the ocean to the western edge of US Highway 101 at the Wave Overhead crossing of the UPRR alignment and expands further east to include the entire US Highway 101 corridor at approximately the western end of the Rincon Beach County Park parking lot (Carpinteria 2019). The location of the southern portion of the trail within the sea level rise hazard zone indicates there would be the potential for accelerated erosion and increased sea cliff retreat to affect the southern trail segments. US Highway 101 and the coastal bike route southward from Rincon Point Road/Bates Road could become permanently inundated by 2100 absent engineering solutions, according to this mapping (Carpinteria 2019).

3.8.2 Relevant Plans, Policies, and Ordinances

3.8.2.1 Federal

Clean Water Act

The federal CWA is the primary surface water protection legislation throughout the country. By employing a variety of regulatory and nonregulatory tools, including establishing water quality standards, issuing permits, monitoring discharges, and managing polluted runoff, the CWA aims to restore and maintain the chemical, physical, and biological integrity of surface waters to support "the protection and propagation of fish, shellfish, and wildlife and recreation in and on the water." The CWA regulates both the pollutant content of point-source discharges, as well as addressing polluted runoff (nonpoint-sources).

Section 401

CWA Section 401 requires that state water quality standards be met and that construction, dredging, and disposal activities not cause concentrations of chemicals in the water column that exceed state standards. CWA Section 401 requires a water quality certification from the SWRCB (as delegated to RWQCBs).

Section 402

CWA Section 402 states that discharge of pollutants to waters of the United States is unlawful unless the discharge is authorized and in compliance with an NPDES permit. The USEPA has granted the state primacy in administering and enforcing the provisions of the CWA and the NPDES Program. The NPDES permit program is the primary federal program that regulates point-source and non-point-source discharges to the waters of the United States (see also NPDES Program below).

National Flood Insurance Program

FEMA's National Flood Insurance Program includes a flood hazard mapping program, in which FEMA identifies flood hazards and assesses flood risks. Under this program, FEMA produces Flood Insurance Rate Maps (FIRMs) which delineates flood risk areas and risk levels. Areas identified as at risk for flooding on the FIRMs are referred to as Special Flood Hazard Areas, which are those areas at risk of the 100-year flood (1% annual chance of flooding). It also delineates areas that are in moderate flood hazard areas, or those areas between a 0.2% annual chance of flooding (500-year flood) and 1.0% chance of flooding (a Special Flood Hazard Area). Special Flood Hazard Areas are further divided into zones, which provide information on the degree of flooding within the risk area, including average depth of flooding.

3.8.2.2 State

Porter-Cologne Act

The Porter-Cologne Act) (California Water Code section 13000 et seq.) is the primary law governing water quality regulation in California. It establishes a comprehensive program to protect water quality and the beneficial uses of

water. The Porter-Cologne Act applies to surface waters, wetlands, groundwater, and to both point and nonpoint sources of pollution. Pursuant to the Porter-Cologne Act, the policy of the state is as follows:

- That the quality of all the waters of the State shall be protected,
- That all activities and factors affecting the quality of water shall be regulated to attain the highest water quality within reason, and
- That the State must be prepared to exercise its full power and jurisdiction to protect the quality of water in the State from degradation.

The Porter-Cologne Act established nine RWQCBs (based on hydrogeologic barriers) and the SWRCB, who are charged with implementing its provisions, have primary responsibility for protecting water quality in California. The SWRCB provides program guidance and oversight, allocates funds, and reviews RWQCB decisions. In addition, the SWRCB allocates rights to the use of surface water. The RWQCBs have primary responsibility for individual permitting, inspection, and enforcement actions in each of nine hydrologic regions.

State Water Resources Control Board and Regional Water Quality Control Boards

The SWRCB and RWQCBs are responsible for preserving, enhancing, and restoring "the quality of California's water resources and ensuring their proper allocation and efficient use for the benefit of present and future generations." The SWRCB develops statewide regulations governing water use and point-source and nonpoint-source pollutant discharge, while the RWQCBs work in smaller regions throughout the state to implement SWRCB policies and regulations. RWQCBs also establish additional region- and area-specific regulations and policies to achieve water quality goals under the CWA and the Porter-Cologne Act.

California Ocean Plan

The SWRCB adopted the California Ocean Plan in 1972 and amended it recently in 2015 and again in 2019 (SWRCB 2019). The Ocean Plan provides control for the discharge of waste to ocean waters and ensures the protection of beneficial uses of ocean waters. The Ocean Plan sets forth water quality objectives (WQOs) for protection of marine aquatic life and sets forth objectives for bacterial, physical, chemical, and biological characteristics for ocean waters. Compliance is determined from samples collected within the waste field where initial dilution is completed. In cases where there is conflict between limitations set forth in the Ocean Plan and those set forth in other federal or state legislation, the more stringent limitations apply. The 2019 update of the Ocean Plan includes an amendment to address issues associated with desalination facilities (Desalination Amendment).

Water Quality Control Plan for the Central Coast Basin

The City of Carpinteria and County of Santa Barbara are within the jurisdiction of the Central Coast RWQCB. This region's Water Quality Control Plan for the Central Coast Basin (Basin Plan) (RWQCB 2017) details the existing and potential beneficial surface and groundwater uses in the region, as well as water quality objectives and implementation measures throughout the basin. The Basin Plan includes water quality objectives and implementation measures for water quality parameters, including the following:

Ocean Waters

- Dissolved Oxygen
- pH
- Radioactivity

National Pollutant Discharge Elimination System Program

General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities

In California, the SWRCB administers regulations promulgated by the USEPA (55 CFR 47990) requiring the permitting of stormwater-generated discharges under the NPDES. Dischargers whose projects disturb one or more acres of soil are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit) (Order 2009-0009 DWQ amended by 2010-0014-DWQ and 2012-0006-DWQ, NPDES Permit CAS000002). Construction activity subject to this permit includes clearing, grading and disturbances to the ground such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the submittal of a Notice of Intent) and the development and implementation of an SWPPP. The SWPPP should contain a site map that shows the construction site perimeter, existing and proposed buildings, lots, roadways, stormwater collection and discharge points, general topography both before and after construction, and drainage patterns across the project. The SWPPP must list Best Management Practices (BMPs) the discharger will use to protect stormwater runoff and the placement of those BMPs. Additionally, the SWPPP must contain a visual monitoring program; a chemical monitoring program for non-visible pollutants to be implemented if there is a failure of BMPs; and a sediment monitoring plan if the site discharges directly to a water body listed on the 303(d) list for sediment.

3.8.2.3 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan

The City of Carpinteria's General Plan/Local Coastal Land Use Plan Safety Element includes the following objectives and policies relevant to flood hazards and the proposed project (City of Carpinteria 2003):

Objective S-4 Minimize the potential risks and reduce the loss of life, property and the economic and social dislocations resulting from flooding.

Policy S-4a All new development proposed in the 100-year floodplain must adhere to the County of Santa Barbara Floodplain Management Ordinance, Chapter 15-A of the County Code.

Policy S-4b The development of critical facilities within the 100-year floodplain should be discouraged.

Policy S-4c Setbacks from flood control channels, as determined by the Santa Barbara County Flood Control District, will be required to allow access to maintain and enable proper operation of the channels.

Policy S4-e The City shall establish setback guidelines for land use planning purposes along natural creek, river, or stream floodplains, and identify and pursue opportunities to eliminate existing concrete channels and/or banking from creeks, rivers, or streams

The General Plan/Local Coastal Land Use Plan Open Space, Recreation and Conservation Element includes the following objectives and policies relevant to hydrology and water quality:

Objective OSC-6 Preserve the natural environmental qualities of creekways and protect riparian habitat.

Policy OSC-6d Carry out and maintain all permitted construction and grading within stream corridors in such a manner so as to minimize impacts on biological resources and water quality such as increased runoff, creek bank erosion, sedimentation, biochemical degradation, or thermal pollution.

Policy OSC-6e Natural drainage patterns and runoff rates and volumes shall be preserved to the greatest degree feasible by minimizing changes to natural topography, and minimizing the areas of impervious surfaces created by new development.

Policy OSC-6f All development shall be evaluated for potential adverse impacts to water quality and shall consider Site Design, Source Control and Treatment Control BMPs in order to minimize polluted runoff and water quality impacts resulting from the development. In order to maximize the reduction of water quality impacts, BMPs should be incorporated into the project design in the following progression: (1) Site Design BMPs, (2) Source Control BMPs, and (3) Treatment Control BMPs.

Objective OSC-10 Conserve all water resources, and protect the quality of water

Policy OSC-10a Minimize the erosion and contamination of beaches. Minimize the sedimentation, channelization and contamination of surface water bodies.

Policy OSC-10c Degradation of the water quality of groundwater basins, nearby streams or wetlands, or any other waterbody shall not result from development. Pollutants such as sediments, litter, metals, nutrients, chemicals, fuels or other petroleum hydrocarbons, lubricants, raw sewage, organic matter and other harmful waste shall not be discharged into or alongside any waterbody during or after construction.

Santa Barbara County Coastal Land Use Plan

The County's Coastal Land Use Plan applies to the coastal areas of the County, including the project site. The following policy of the Coastal Land Use Plan is relevant to the Proposed Project related to hydrology and water quality (County of Santa Barbara 2019):

Policy 3-12 Permitted development shall not cause or contribute to flood hazards or lead to expenditure of public funds for flood control works, i.e., dams, stream channelizations, etc.

3.8.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to hydrology and water quality are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to hydrology and water quality would occur if the project would:

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

   i. result in substantial erosion or siltation on or off-site.

   ii. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off-site.

   iii. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.

   iv. impede or redirect flood flows.

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

f) Result in cumulatively considerable hydrological or water quality impacts.

3.8.3.1 Local Significance Thresholds

The City of Carpinteria's Guidelines for the Implementation of the California Environmental Quality Act of 1970, as Amended (1997), states that the following conditions or impacts shall be considered significant:

Hydrology

Flooding

a) Significant impacts result if the project would impose flood hazards on other properties.

b) The Municipal Code prohibits development within areas of special flood hazard except under certain circumstances. The policy requires approval by the Floodplain Administrator before construction, development or alteration begins within any area of special flood hazard.

If the project would result in increased runoff:

a) Impacts on hydrologic conditions may be significant because the area available for aquifer recharge is reduced. This may impact well water supplies.

b) There may be significant impacts on stream hydrology if uncontrolled runoff results in erosion and subsequent sedimentation of downstream water bodies.

   Threshold:

   - moderate to large-scale projects where grading would occur during rainy season; or
   - projects proximate to bodies of water or drainageways.

If project would result in modifications to existing drainage patterns:

a) There may be significant impacts on biological communities if drainage patterns are changed.
Threshold:

- Projects where drainage patterns are influenced such that existing vegetation would decline because long-or short-term soil-plant-water relationships would no longer meet habitat requirements.
- Projects which would result in substantial changes to streamflow velocities.

Water Quality

Pollution/Contamination

a) Impacts on water quality may result in significant human health and safety impacts.
Threshold:

- Projects which would generate any amount of highly noxious substance.
- Projects which would generate large amounts of substances which in small amounts are insignificant but are cumulatively hazardous.
- Projects that would result in the deterioration of the quality of a drinking water source.

b) Impacts on water quality may have significant impacts on biological communities.
Threshold:

- Projects which would generate, or result in the accumulation of substances which affect health, or cause genetic defects of wildlife either by direct physical contact with contaminated water, or by water quality changes which cause decline in riparian or lacustrine vegetation which provide wildlife habitat.

c) Project would be significant if it would result in erosion and subsequent sedimentation of water bodies:
Threshold:

- moderate to large-scale grading project (>2,000 cubic yards per graded acre)
- projects that results in loss of vegetation on slopes (e.g., brush management measures).

3.8.4 Impact Analysis

a) Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?

Because the majority of the length of proposed trail is outside of the City of Carpinteria's and Santa Barbara County's respective 2013 Statewide Phase II Small Municipal Separate Storm Sewer (MS4) General Permit (2013 General Permit) boundaries, the majority of the project is exempt from the Post Construction Requirements (PCRs) of the 2013 General Permit. Nonetheless, the proposed project has been designed to reduce or minimize the potential for adverse impacts on stormwater quality. The proposed trail would result in approximately 2,800 linear feet (or 1.0 acre) of impermeable surfaces (concrete) but would also include native restoration plantings or hydro-seed application at graded areas along the alignment. Native plantings or the

application of hydro-seed would stabilize slope areas to minimize soil erosion and avoid sediment-related water quality impacts. The re-contouring of existing manufactured slopes to employ a shallower slope angle, revegetation of project slopes, and bench-work to intercept sheet flow across extensive slope faces are the principal project design components intended to ensure the avoidance of water quality impacts. In addition, trail use would be limited to pedestrians and cyclists, motor vehicles would be prohibited except for emergency response or infrequent maintenance activities. Consequently, petroleum distillate contaminants associated with many transportation facilities would not be associated with the proposed mixed-use trail. The use of the trail by pets may lead to pet waste contamination of water runoff. Dog feces, if left behind, can contribute to high bacteria counts in runoff water. However, pet waste receptacles with bags will be provided at the trailheads within the parking areas to encourage clean-up by pet owners and trail users. Because of the potential for sediment and other impurities to affect stormwater quality, the project's long-term impacts to water quality would be potentially significant. **Mitigation Measure (MM) WAT-4**, **MM-WAT-5**, and **MM-WAT-6** are intended to address these long-term water quality impacts and are required to be incorporated.

The proposed project must also meet the construction-related standards set out in the County's and City's Storm Water Management Plans. During construction, soil, dust, paints and concrete may inadvertently enter the stormwater drainage system. A Stormwater Pollution Prevention Plan (SWPPP) covering water quality protection during the construction phase of the project would be required to be prepared and implemented by the applicant pursuant to the National Pollutant Discharge Elimination System (NPDES) State Construction Activities Storm Water General Permit. The General Permit, which is implemented by the State Water Resources Control Board, is required for projects disturbing one acre or more of soil. The SWPPP is required to include BMPs to be implemented during construction to control the discharge of materials from the site, and may include temporary retention basins, straw bales, sand bagging, mulching, erosion control blankets or soil stabilizers. Standard erosion control measures, as identified below, would ensure that the project does not have the potential to result in substantial soil erosion affecting water resources. Accordingly, the project would result in water quality impacts that are significant without mitigation. **MM-WAT-1, MM-WAT-2** and **MM-WAT-3** are intended to reduce these short-term water quality impacts to less than significant levels and are required to be incorporated. **Impacts would be less than significant with mitigation incorporated.**

b) Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin?

The project would not significantly deplete groundwater supplies or interfere substantially with groundwater recharge. Given the relatively small size of the alignment (approximately 1.0 acre of trail surface) and the use of native vegetation restoration where feasible, the project would not significantly interfere with natural groundwater recharge. With respect to groundwater depletion, no new water supply would be required to serve the proposed trail use; native vegetation employed for biological restoration and project landscaping would not require irrigation following an initial grow-in period. Cut and fill areas are typically well drained with a very rapid surface runoff (USDA 2019) which will be addressed through project design features and standard stormwater and erosion control measures to ensure no adverse effects on existing groundwater supplies will occur from project implementation. The project's impact on groundwater supplies would be **less than significant**

c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

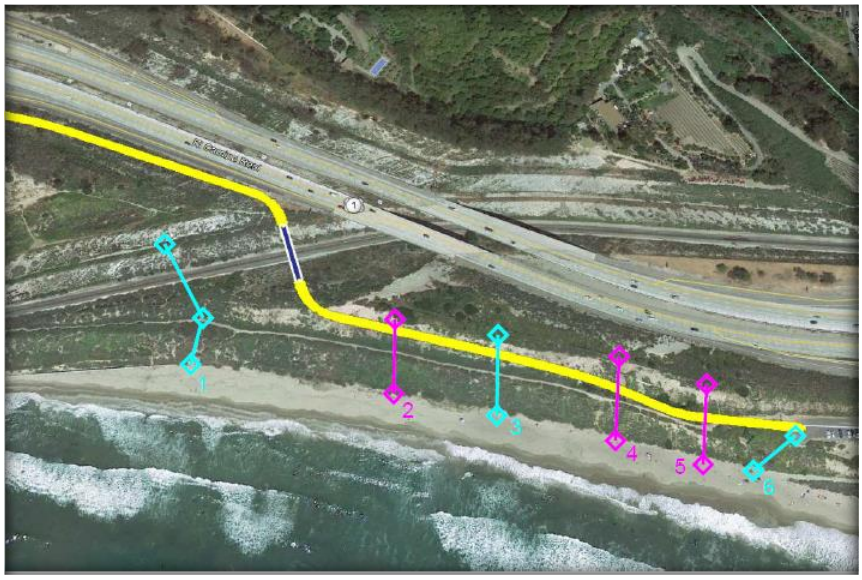
i. result in substantial erosion or siltation on or off-site?

ii. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off-site?

iii. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

iv. impede or redirect flood flows?

The project would moderately alter the existing drainage patterns of the site, via regrading of project slopes and short-term removal of vegetation, as well as through introduction of the impervious trail surface (approximately 1 acre of new impervious surface). Increased stormwater runoff and erosion potential during construction and until new vegetation is established are addressed under **MM-WAT-1, MM-WAT-2,** and **MM-WAT-3**. Long-term stormwater runoff from the trail surface would be collected by a concrete v-ditch adjacent to the trail, and released through a series of short length storm drains with discharge along the adjacent beach. The provision of project-specific storm drains would accommodate the storm runoff volumes anticipated from the project's impervious surfaces, and also avoid directing stormwater to existing public storm drain systems in the project vicinity that could lack surplus capacity to accommodate the project. Release of project storm drainage along the beach would not result in substantial erosion, as the introduction of impervious surface would be minimal compared to the overall project drainage area and the trail drainage will be divided into 6 separate outlets to minimize the discharge volume from any of the outlets. Illustration 3.8-1 illustrates these 6 outlets, three exist (blue color) and three would be new (magenta).



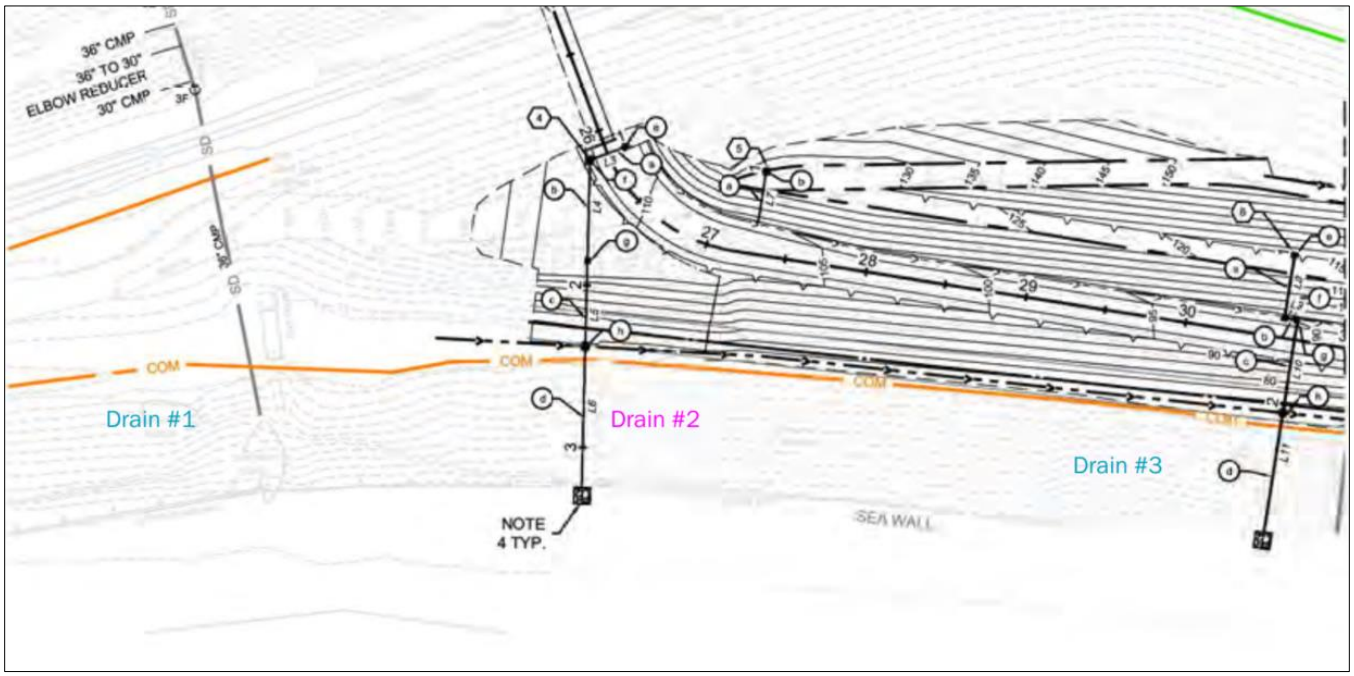


Illustration 3.8-1 Major Storm Drainage Components of the Project

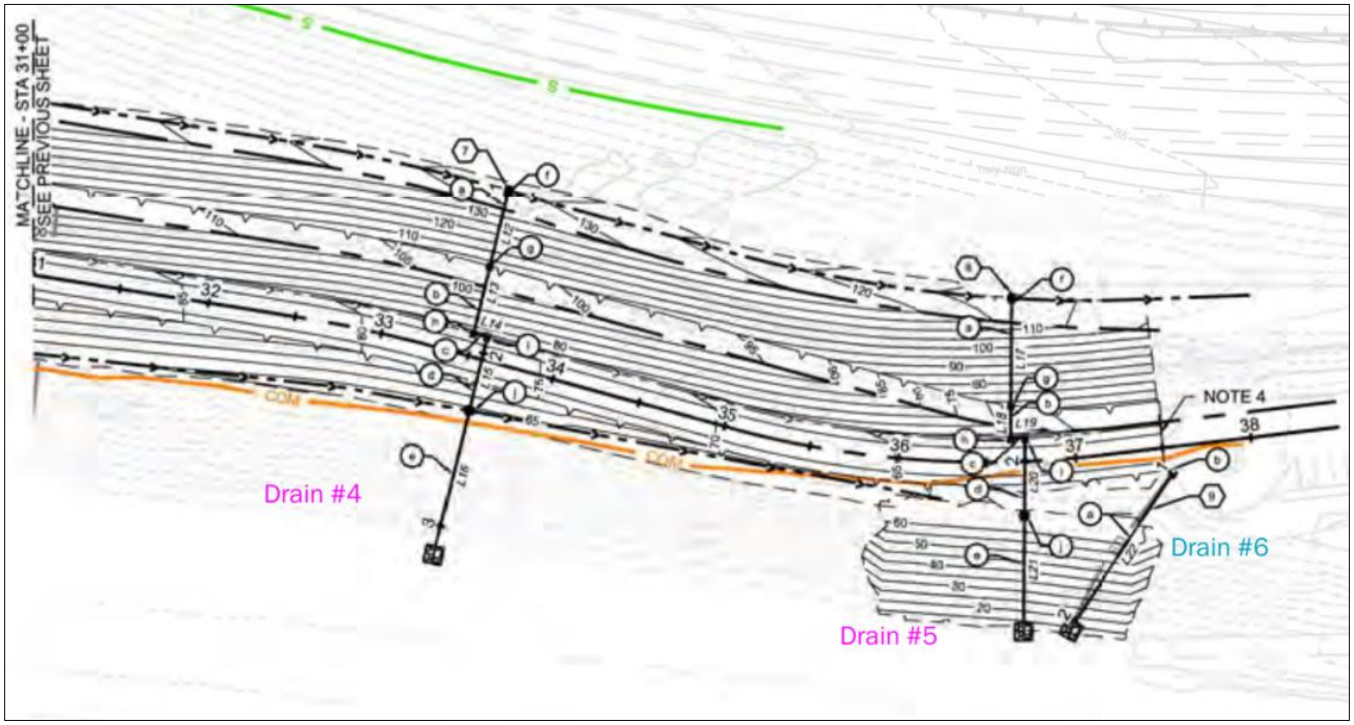

SOURCE: Bengal Engineering

Illustrations 3.8-2 and 3.8-3 provide plan sheet excerpts of the proposed drainage system outlets, with connection to other drainage conveyance elements.

Illustration 3.8-2 Design Details for Storm Drain Outlets #1 - #3

SOURCE: Bengal Engineering

Illustration 3.8-3 Design Details for Storm Drain Outlets #4 - #6

The proposed storm drain system includes concrete v-ditch for collection and conveyance of runoff water, drop inlets connecting to vertical drainpipes, and outlets at the beach elevation. The concrete v-ditch components would be durable, and not prone to weathering or failure over time. The vertical drains are proposed to be composed of a 12-inch diameter corrugated metal pipe. The pipe would be buried to cross beneath the trail section and would descend partly down the bluff face. However, in order to allow visual access for inspection of the pipe integrity, the lower portion of the storm drainpipe would be mounted on the surface of the slope/bluff face. The corrugated metal material was selected for weight consideration and as a superior material to PVC for withstanding damage from fire or sun exposure. However, the metal is prone to rust or corrosion, with the potential for collapse or failure over time. Leaks from the vertical drains would contribute to erosion of the bluff face, failure of a vertical storm drain could lead to significant erosion of the bluff face. The storm drains would be installed by the project, **MM-WAT-5** requires periodic inspection and maintenance of the storm drains in perpetuity to prevent failure of such facilities. Accordingly, the project's impacts on existing drainage patterns and storm drain systems would be potentially significant. Incorporation of **MM-WAT-5** would reduce impacts to **less than significant with mitigation**.

The proposed project does not include housing units or habitable structures other than minor trail amenities and ancillary support features, such as the proposed pedestrian bridge over the UPRR corridor. Furthermore, according to the current Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) for the area (Panel 06083C1438H), the project is not located within a 100-year or a 500-year flood boundary (FEMA 2019). According to the Santa Barbara County's Fire Protection Districts, High Fire Hazard Areas and Flood Hazard Areas Map, the proposed project is not located within a 100-year flood hazard overlay (County of Santa Barbara 2017). The project alignment would not be located in the vicinity of a levee or dam.

The bluff face portion of the project south of the UPRR corridor is identified in both the City of Carpinteria's Sea Level Rise Vulnerability Assessment and the County of Santa Barbara's Vulnerability Assessment as being an area expected to be susceptible to erosional impacts as a result of sea level rise, which could reach up to a worst-case maximum of 10 feet by year 2100 (City of Carpinteria 2019). In fact, the erosion hazard limits associated with sea level rise in year 2100 extend to US Highway 101, in the areas just east of the UPRR undercrossing of US Highway 101 (City of Carpinteria 2019). Using the "high GHG emissions" scenario, the alignment of the trail south of the UPRR crossing generally follows the boundary between the Year 2030 hazard area and the Year 2060 hazard area. The drainage system outlets infrastructure would be located within the Year 2030 hazard area, on the ocean side of the trail. Based upon the "high GHG emissions:" the probability that sea level rise would reach 1 foot by the year 2030 is 0.5%; the probability it will reach 2 feet by 2060 is 2%. With sea level one to two feet higher, the bottom of the storm drain outlets could be submerged at times, and the face of the bluff adjacent to the drains could experience accelerated erosion. Some additional maintenance may be required to replace corroded elements at the bottom of the drain outlets or to re-anchor the lower end of the drain outlets to the bluff face. However, wholesale replacement of the bluff-face vertical down drain portions of the storm drain system because of sea level rise damage is not anticipated to be required even by the Year 2060, and based on the "high GHG emissions" estimate. Similarly, the trail itself would not be directly threatened by the 2-foot sea level rise predicted by 2060, which has only a 2% calculated probability of occurrence.

By the Year 2100, there is a 2% probability of a 5-foot rise in sea level elevation along the coast adjacent to Carpinteria Bluffs and Rincon Point using the "high GHG emissions" scenario (City of Carpinteria 2019). With this magnitude of sea level rise, the erosion hazard zone would extend from the ocean up

to the US Highway 101 corridor, east (or south) of the UPRR crossing, which would envelop the entire southern portion of the trail alignment and the Rincon Beach County Park facilities. Accelerated erosion would primarily result from wave action superimposed on the higher elevation sea level surface, jeopardizing the base area of the existing coastal bluff/sea cliff. Bluff retreat/erosion rates for the Monterey formation in southern Santa Barbara County average approximately ½ foot per year (Santa Barbara County 2017); however, the anticipated acceleration of bluff retreat rates from sea level rise have not been quantified.

The proposed trail is set back from the base of the bluffs by a distance ranging between 60 and 100 feet horizontally. Even if the bluff retreat rates were to double from the influence of sea level rise (i.e., 1 foot per year), the closest portion of the trail to the base of the existing sea cliff would represent a horizontal distance equivalent to 60 years of erosion. While storm drain outlets on the bluff face may need to be periodically repaired or replaced in this 60-year period, the trail itself likely would not be threatened within this timeframe. For transportation infrastructure, a useful life of 50-75 years is typically employed (50 years for pavement, 75 years for bridges, Caltrans 2018). Thus, even with accelerated erosion of the bluff face caused by coastal flooding (i.e., greater wave uprush or more frequent inundation of the bluff base), the alignment of the trail south of the UPRR corridor is not anticipated to be impacted by sea level rise or exacerbated coastal flooding over the useful life of the project. In addition, recommendations prescribed in the geotechnical report (Bengal 2019) for the slope created above and below the trail bench would increase the stability of these slopes and reduce the existing erosion rates for the bluff faces along the southern trail alignment, which could partially offset the predicted acceleration of erosion rates associated with sea level rise. **No flood hazard impacts** would occur.

The City of Carpinteria's Sea Level Rise Vulnerability Assessment indicates that the Rincon Beach County Park could be at risk for inundation by 2060 (Carpinteria 2019). To protect similar recreation facilities, the City of Santa Barbara and City of Carpinteria have a long-standing practice of building a winter sand dune or berm along their respective beaches. Creation of a winter sand berm might be one feasible approach used by the County in the future to protect the Rincon Beach County Park facilities. Extending the creation of such an annual winter berm eastward along the base of the bluffs also could be one method contemplated for slowing overall bluff retreat rates that have been accelerated by sea level rise.

d) In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?

Inundation by seiche, tsunami, or mudflow can result from strong seismic activity, and such inundation is especially of concern where it could affect development involving pollutant sources potentially released to the environment. According to the City of Carpinteria's General Plan/Coastal Plan Fault Map, the Rincon Creek fault is located to the north of the proposed project and the Carpinteria Fault is located to the south (City of Carpinteria 2003). Although the Pacific Ocean is located to the south of the proposed project site, the proposed trail is located at elevations ranging from 40 feet above sea level to 185 feet above sea level. Where the trail is aligned along the bluffs, the elevation ranges from approximately 65 to 75 feet above sea level. According to the California Department of Conservation Tsunami Inundation Map For Emergency Planning - Carpinteria Quadrangle, the project site is not located within an area of potential tsunami inundation (CDOC 2009). The proposed project is not located near an enclosed or partially enclosed body of water; therefore, there would not be subject to inundation by seiche. Areas susceptible to debris and mud flows correspond to the areas with a high potential for earthquake-induced landslides. The City of Carpinteria's General Plan Slope Stability Hazards Map indicates that the project

is not located within a high landslide potential area or a high rock fall potential area (City of Carpinteria 2003). Finally, the project does not involve any hazardous materials or other pollutants that could be released in the event of inundation of the project site. Impacts relating to inundation by seiche, tsunami or mudflow would be **less than significant.**

e) Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Because the majority of the length of proposed trail is outside of the City of Carpinteria's and Santa Barbara County's respective 2013 Statewide Phase II Small Municipal Separate Storm Sewer (MS4) General Permit (2013 General Permit) boundaries, the majority of the project is exempt from the Post Construction Requirements (PCRs) of the 2013 General Permit. The project proposes drought-tolerant native landscaping with no permanent irrigation source, and therefore groundwater extraction to support the project would be temporary during plant establishment and would not conflict with any adopted sustainable groundwater management plan. Temporary irrigation during the plant establishment period (first year) would be provided via small-scale water trucks. **No impacts** would occur to a water quality control plan or sustainable groundwater management plan.

f) Would the project result in cumulatively considerable hydrological or water quality impacts?

Cumulative development throughout the Carpinteria Valley would incrementally contribute to hydrology and water quality impacts. However, based on the analysis above, and with adherence to applicable Objectives and Policies found in the City and County's General Plan/Local Coastal Land Use Plans, the project's contribution to cumulative water resource impacts would not be considerable and would be further reduced through the implementation of the project specific measures below.

3.8.5 Mitigation

The project would require the implementation of **MM-WAT-1** through **MM-WAT-5** to reduce potential project impacts to surface water quality.

MM-WAT-1 **Obtain Coverage Under Construction General Permit**. The project shall obtain coverage under a Construction General Permit via the State Water Resources Control Board (SWRCB) (Water Quality Order 99-08-DWQ).

Plan Requirements: The requirement to obtain coverage from the SWRCB under a Construction General Permit shall be indicated on grading plans. ***Timing***: Evidence of coverage under a Construction General Permit shall be provided to the City of Carpinteria Public Works Department and County of Santa Barbara Public Works Division prior to the initiation of grading. ***Monitoring***: City and County Public Works staff shall confirm evidence of the Construction General Permit issuance prior to issuance of grading permits.

MM-WAT-2 **Stormwater Pollution Prevention Plan.** The construction contractor shall prepare a Stormwater Pollution Prevention Plan that includes Best Management Practices (BMPs) to be implemented and monitored prior to and during construction. The following BMPs shall be incorporated into the SWPPP to minimize potential construction-related water quality impacts:

1. Disturbed areas shall be stabilized or re-vegetated prior to the start of the rainy season. The work area shall be flagged to identify its limits. Vegetation shall not be removed or intentionally damaged beyond these limits.
2. Construction materials shall be placed in designated areas where they could not enter water bodies or storm drains due to spillage or erosion.
3. Waste and debris generated during construction shall be stored in designated waste collection areas and containers away from watercourses and shall be disposed of regularly.
4. During construction, washing of concrete trucks, paint, equipment, or similar activities shall occur only in areas where polluted water and materials can be contained for subsequent removal from the site. Wash water shall not be discharged to the storm drains, street, drainage ditches, creeks, or wetlands. The concrete washout area shall be isolated from water bodies, and wash water and waste shall be removed from the project site. The location of the washout area shall be clearly noted at the construction site with signs.
5. All fueling of heavy equipment shall occur in a designated area removed from water bodies and other drainages, such that any spillage would not enter surface waters. The designated refueling area shall include a drain pan or drop cloth and absorbent materials to clean up spills. The location of the fueling area shall be clearly noted at the construction site with signs.
6. Vehicles and equipment shall be maintained properly to prevent leakage of hydrocarbons and coolant and shall be examined for leaks on a daily basis. All maintenance shall occur in a designated off-site area. The designated area shall include a drain pan or drop cloth and absorbent materials to clean up spills.
7. Any accidental spill of hydrocarbons or coolant that may occur on the construction site shall be cleaned up immediately. Absorbent materials shall be maintained on the construction site for this purpose.
8. Special considerations for work during the rainy season: stockpiled soils should be covered at the end of the work day, and concrete pouring shall be avoided within 15 days of a forecasted rain event to allow full curing, due to its toxic nature until it has fully cured.

Plan Requirements: A Stormwater Pollution Prevention Plan (SWPPP) shall be prepared and implemented prior to construction and shall include the above elements. The SWPPP shall be submitted to City and County Public Works for review and approval prior to the issuance of grading permits for the project. ***Timing***: The stormwater features and BMPs shall be installed and operational prior to initiation of grading. ***Monitoring***: City and County Public Works staff shall site inspect for installation and maintenance in accordance with the approved plan and periodically thereafter to ensure proper maintenance over the duration of construction activities.

MM-WAT-3 **Erosion and Sediment Control Plan.** Best available erosion and sediment control measures shall be implemented and maintained during grading and construction. Best available erosion and sediment control measures may include, but are not limited to use of sediment basins, gravel bags, silt fences, geo-bags or gravel and geotextile fabric berms, erosion control blankets, coir rolls, jute

net and straw bales. Construction access points shall be stabilized using gravel beds, rumble plates or other measures to prevent sediment from being tracked onto adjacent roadways. Any sediment or other materials tracked off site shall be removed the same day as they are tracked using dry cleaning methods.

Plan Requirements and Timing: An erosion and sediment control plan shall be submitted to and approved by City and County Public Works prior to issuance of grading permits. The plan shall be designed and implemented to address erosion and sediment control during all phases of development of the site. ***Monitoring***: City and County Public Works shall perform site inspections throughout construction.

MM-WAT-4 **Planting of Vegetation.** As soon as practicable following the completion of trail construction, the contractor shall install native plantings for biological restoration and hydro-seed slope areas with an appropriate native plant seed mix, in order to provide long-term stabilization of soils disturbed during construction. Periodic watering and re-application of hydro-seed shall occur as necessary until vegetation on slope surfaces has been successfully established.

Plan Requirements and Timing: Landscaping plans including biological restoration areas and hydro-seeding of manufactured slope areas submitted to Community Development Department/Planning & Development (CDD/P&D) for review prior to approval of a coastal development permit. ***Monitoring***: CDD/P&D shall site inspect vegetation plantings and hydro-seed application before issuing final clearance and acceptance of the trail project.

MM-WAT-5 **Periodic Inspection and Maintenance of Storm Drain Components.** Staff from City and County Parks/Public Works departments shall perform an annual inspection of stormwater components annually, prior to the on-set of the rainy season (November 1) to ensure all components are in good repair and are not blocked by debris or sediment. Any materials found to be obstructing flow in the drainage system shall be removed prior to November 1 each year. The exposed vertical portion of each of the corrugated metal pipe drains shall be examined annually for signs of corrosion, damage or openings in the drain pipe wall. Corrosion visible on the exterior pipe wall shall be treated and sealed promptly, any holes through the pipe wall shall be patched, or the damaged/affected segment shall be replaced or modified.

Plan Requirements and Timing: The applicant shall include these inspection and maintenance requirements in the final drainage system design plans. The plans shall be submitted to Community Development Department/Planning & Development (CDD/P&D) and City and County Public Works for review prior to approval of a grading permit. ***Monitoring***: A memo with the annual inspection notes and corrective maintenance performed shall be prepared and submitted to the City and County Public Works Departments.

MM-WAT-6 To minimize pollutants impacting the ocean, storm drain filters/inserts shall be installed in the project area storm drain inlets. The filters/inserts shall be maintained in working order.

Plan Requirements: Prior to approval of Grading or Building Permits, the applicant shall submit plans identifying the type and location of filters/inserts to Community Development Department/Planning & Development (CDD/P&D) and City and County Public Works for review and approval. The location of such filters/inserts shall be noted on grading and building plans

Filters/inserts shall be installed prior final clearance and shall be cleaned using approved methods at least twice a year, once immediately prior to November 1 (before the start of the rainy season) and once in January. **Monitoring:** CDD/P&D and City and County Public Works shall site inspect periodically throughout the construction phase to ensure proper installation. Records of maintenance shall be maintained by City/County and shall be submitted to CDD/P&D and City and County Public Works on an annual basis prior to the start of the rainy season and for five years thereafter. After the fifth year, the records shall be maintained by the City/County. CDD/P&D and Public Works shall review the maintenance records and site inspect as needed following completion of construction to ensure periodic cleanout

3.8.6 Level of Significance After Mitigation

After implementation of **MM-WAT-1** through **MM-WAT-6**, residual impacts to hydrology and water quality resulting from potential uncontained stormwater runoff or soil erosion and sedimentation during construction and operation of the project would be less than significant.

INTENTIONALLY LEFT BLANK

3.9 Land Use and Planning

This section describes the existing land uses within the Carpinteria Rincon Trail Project (project or proposed project) site and vicinity, identifies the land use and zoning designations applicable to the project site, provides associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project.

3.9.1 Existing Conditions

The proposed Carpinteria Rincon Trail would extend from the eastern end of Carpinteria Avenue to Rincon Beach County Park along abandoned roadways or old terraced road and rail cuts. The current alignment for the Union Pacific Railroad (UPRR) is oriented east/west within the project site, and roughly bisects the proposed trail near the center of its alignment. A small unsanctioned trail exists in some areas of the proposed trail, including the portion of the proposed trail from the UPRR crossing to the Rincon Beach County Park parking lot.

The Land Use Elements in the City General Plan/Local Coastal Land Use Plan and County Comprehensive Plan establish the types and intensities of land uses within these communities and guide growth and development within Carpinteria and unincorporated County lands within the Carpinteria Valley. The Land Use Element is the heart of the Land Use Plan of the two certified Local Coastal Programs (California Coastal Act of 1976 Section 30108.5); however, other elements of the General Plan are also included as components of the Land Use Plan for the purposes of the respective Local Coastal Programs.

The vision for the City includes qualities the community would like to retain and aspects that could benefit from change. The City and surrounding area enjoy a variety of attractive natural resources including safe, clean beaches, coastal bluffs, a salt marsh, several creeks, a narrow valley and a coastal mountain range. These same features contribute to the environmental qualities of the surrounding County lands.

U.S. Highway 101 is located to the north of the proposed trail alignment, with the Pacific Ocean to the south below the Carpinteria bluffs; the UPRR rail corridor bisects the central portion of the trail alignment. Undeveloped bluff open space is located adjacent to the western terminus of the trail and existing informal dirt parking lot, while Rincon Beach County Park and the Rincon Point residential community are located adjacent to the eastern terminus of the trail.

The portion of the project site within the City has a General Plan/Coastal Land Use Plan land use designation of Visitor-Serving Commercial (City of Carpinteria 2003) and has been zoned for Resort Zone District use (City of Carpinteria 2021). The portion of the project within the County of Santa Barbara is designated as Other Recreation/Open Space (County of Santa Barbara 2019) and is zoned Transportation Corridor and Recreation (County of Santa Barbara 2020). The proposed public multi-use trail would conform to the allowed uses under the existing land use designations of the City and County, and would also be consistent with the zoning designations of both jurisdictions.

3.9.2 Relevant Plans, Policies, and Ordinances

3.9.2.1 Federal

There are no federal plans, policies, or ordinances applicable to the land use considerations of the proposed project.

3.9.2.2 State

California Coastal Act of 1976

The California Coastal Act of 1976 (Coastal Act) establishes goals and provisions for a designated Coastal Zone along the entire California coastline. Within the City of Carpinteria, the Coastal Zone is coterminous with the City Boundary. In August 2003, the California Coastal Commission certified the latest update of the City's Coastal Land Use Program, further discussed below. In the Carpinteria Valley outside of the City, the Coastal Zone generally extends inland to State Route 192/150. The California Coastal Commission certified the latest update of the County's Coastal Land Use Program in 1981 (County of Santa Barbara 2019).

Senate Bill 375

The adoption of California's Sustainable Communities and Climate Protection Act, Senate Bill (SB) 375 on September 30, 2008, aligns with the goals of regional transportation planning efforts, regional greenhouse gas (GHG) reduction targets, and land use and housing allocations. SB 375 requires Metropolitan Planning Organizations such as the Santa Barbara County Association of Governments (SBCAG) to adopt a Sustainable Communities Strategy (SCS) within their regional transportation plan to demonstrate achievement of GHG reduction targets. In compliance with SB 375, SBCAG has adopted an SCS that covers all of the City of Carpinteria, as well as other cities and unincorporated portions of Santa Barbara County (SBCAG 2013).

3.9.2.3 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan

California State Government Code Section 65300 requires that every city adopt a General Plan, sometimes referred to as a City's blueprint for growth and development. The City's General Plan, originally adopted in 1986 and updated in 2003, contains the seven mandatory elements: Land Use, Circulation, Housing, Conservation, Open Space, Noise and Safety. The City's General Plan combined several of these required elements with an optional element, resulting in the Open Space, Recreation & Conservation Element. The Carpinteria General Plan also included several additional desired optional elements: The Community Design Element and Public Facilities and Services Element (City of Carpinteria 2003). The Land Use Element is described in further detail below, including applicable objectives and policies. The remaining elements of the Carpinteria General Plan are described within the EIR sections to which they pertain. This document also serves as the City's Local Coastal Land Use Plan, which ensures that the local government's land use plans, zoning ordinances, zoning maps, and implementation actions meet the requirements, provisions and polices of the California Coastal Act.

City of Carpinteria General Plan – Land Use Element

The Land Use Element designates various land uses in the city and specifies the development and land uses which are allowed within each land use district (City of Carpinteria 2003). The Land Use Element is intended to establish and maintain an organized and balanced set of land uses within the City to offer economic, housing, and recreation opportunities while avoiding conflict between land uses. Objectives and polices from the Land Use element which are applicable to the proposed project are presented below.

Objective LU-1 Establish the basis for orderly, well planned urban development while protecting coastal resources and providing for greater access and recreational opportunities for the public.

LU-1d Ensure that the type, location and intensity of land uses planned adjacent to any parcel designated open space/recreation or agriculture (as shown on Figure LU-1) are compatible with these public resources and will not be detrimental to the resource.

Objective LU-3 Preserve the small beach town character of the built environment of Carpinteria, encouraging compatible revitalization and avoiding sprawl development at the city's edge.

LU-3b The Community Design Element shall guide the character of development, and represent a comprehensive statement of the community's visual objectives.

LU-3h Develop land uses that encourage the thoughtful layout of transportation networks, minimize the impacts of vehicles in the community, and encourage alternative means of transportation.

Santa Barbara County Comprehensive Plan

As indicated above, California State Government Code Section 65300 requires all cities and counties adopt a comprehensive, long-term general plan that outlines physical development of the county or city. The County of Santa Barbara refers to theirs as a Comprehensive Plan, to avoid confusion with the City of Santa Barbara General Plan. The comprehensive plan must cover a local jurisdiction's entire planning area so that it can adequately address the broad range of issues associated with the city or county's development. Ultimately, the comprehensive plan expresses the community's development goals and embodies public policy relative to the distribution of future public and private land uses. The Santa Barbara County Comprehensive Plan contains the following Elements: Agriculture, Circulation, Coastal Land use Plan, Conservation, Energy, Environmental Resources Management, Hazardous Waste, Housing, Land Use, Noise, Open Space, Scenic Highways, Seismic Safety & Safety. The Coastal Land Use Plan is described in further detail below, including applicable objectives and policies. The remaining elements of the County Comprehensive Plan are described within the EIR sections to which they pertain.

Santa Barbara County Comprehensive Plan – Coastal Land Use Plan

The Coastal Land Use Plan lays out the general patterns of development throughout areas officially designated within the coastal zone of the unincorporated County. The following policies could be applicable to planning and implementation of the project (County of Santa Barbara 2019).

Policy 7-1 The County shall take all necessary steps to protect and defend the public's constitutionally guaranteed rights of access to and along the shoreline. At a minimum, County actions shall include:

a. Initiating legal action to acquire easements to beaches and access corridors for which prescriptive rights exist consistent with the availability of staff and funds.

b. Accepting offers of dedication which will increase opportunities for public access and recreation consistent with the County's ability to assume liability and maintenance costs.

c. Actively seeking other public or private agencies to accept offers of dedications, having them assume liability and maintenance

responsibilities, and allowing such agencies to initiate legal action to pursue beach access.

Policy 7-2 For all development between the first public road and the ocean granting of an easement to allow vertical access to the mean high tide line shall be mandatory unless:

a. Another more suitable public access corridor is available or proposed by the land use plan within a reasonable distance of the site measured along the shoreline, or

b. Access at the site would result in unmitigable adverse impacts on areas designated as "Habitat Areas" by the land use plan, or

c. Findings are made, consistent with Section 30212 of the Act, that access is inconsistent with public safety, military security needs, or that agriculture would be adversely affected, or

d. The parcel is too narrow to allow for an adequate vertical access corridor without adversely affecting the privacy of the property owner. In no case, however, shall development interfere with the public's right of access to the sea where acquired through use unless an equivalent access to the same beach area is guaranteed.

Policy 7-5 For areas controlled by Federal, State, County, or District agencies, in a zone extending approximately 250 feet inland from the mean high tide line, priority shall be given to coastal dependent and related recreational activities and support facilities. However, camping facilities should be set back from the beach and bluffs and nearshore areas reserved for day use activities. Recreational activities that are not coastal dependent may be located within this 250-foot zone if the less desirable coastal dependent support facilities (parking, restrooms, etc.) are located inland. In no case shall facilities, except for required structures (i.e., lifeguard towers, volleyball nets, etc.), be located directly on the dry sandy beach.

Policy 7-6 Recreational uses on oceanfront lands, both public and private, that do not require extensive alteration of the natural environment (i.e., tent campgrounds) shall have priority over uses requiring substantial alteration (i.e., recreational vehicle campgrounds).

Policy 7-8 Increased opportunities for beach access shall be provided in the Carpinteria planning area.

Policy 7-26 All proposed trails for the coastal zone shall be incorporated into the County's Master Plans89 for hiking, biking, and equestrian trails.

3.9.3 Thresholds of Significance

The significance criteria used to evaluate the Project impacts to land use and planning are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to land use and planning would occur if the project would:

a) Physically divide an established community.
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.
c) Result in cumulatively considerable impacts to land use and planning.

3.9.4 Impact Analysis

a) Would the project physically divide an established community?

The proposed project consists of a shared use path that would provide safe access from the existing eastern terminus of pedestrian and cyclist paths associated with Carpinteria Avenue to Rincon Beach County Park and the Ventura County line. The project site has been extensively graded over time to accommodate the alignment of former and current transportation facilities, including the previous alignment for the State Highway 2 (abandoned), the former location for the Southern Pacific Railroad (abandoned), and the UPRR tracks (active). Topographic benches remnant from these former and current transportation alignments are in some portions of the project site used for unsanctioned trails. The proposed project would not traverse an established community; instead, the project would provide safe, non-vehicular access and connections between neighborhoods in the City of Carpinteria and the Rincon Beach County Park, as well as connecting to other segments of the coastal trail system, benefiting residents, visitors, and land uses near the project site. **No impact would occur.**

b) Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

The project site within the City of Carpinteria has a Carpinteria General Plan/Coastal Land Use Plan land use designation of Visitor-Serving Commercial (2003) and has been zoned for Resort Zone District use. The portion of the project within the County of Santa Barbara is designated as Other Open Land and Recreation and is zoned Transportation Corridor and Recreation (County of Santa Barbara 2010). The proposed trail is an apt use for the City's and County's vision for the properties within each jurisdiction. While the proposed trail in some areas would traverse areas designated as environmentally sensitive habitat area (ESHA), mitigation measures require the restoration of areas outside the trail to fully offset the removal of native plants to accommodate trail construction (refer to Section 3.3, Biological Resources). With the incorporation of mitigation measures identified in this document to reduce environmental impacts to less than significant levels, the proposed project would not conflict with any applicable land use plan, policy or regulation of an agency with jurisdiction over the project. In addition, no habitat conservation plans or natural community conservation plans apply to the project site. Overall, the proposed project would achieve the goal of enhanced coastal access. In addition, with respect to consideration of parking related to coastal access, construction is not anticipated to reduce parking availability. No parking spaces would be removed by the proposed project. However, absent mitigation, impacts due to conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect would be potentially significant. **Mitigation Measures (MM) AES-1; MM-BIO-1** through **MM-**

BIO-6; MM-CR-1 through **MM-CR-4; MM-GEO-1 through MM-GEO-3; MM-HAZ-1; MM-WAT-1** through **MM-WAT-6; MM-NOI-1** through **MM-NOI-2; MM-TCR-1** would reduce impacts to conflicts with any land use plan, policy, or regulations to **less than significant with mitigation.**

c) Would the project result in cumulatively considerable impacts to land use and planning?

The proposed project would be consistent with the land use and zoning designations that have been assigned to the project site parcels. It would also implement a number of policies aimed at increasing public access to the beach as well as providing transportation alternatives for non-vehicle travel. While portions of the proposed trail would traverse designated ESHA, **MM-BIO-1** through **MM-BIO-4** would be required to fully offset the project's reduction in habitat area (refer to Section 3.3). In addition, impacts due to conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect would be potentially significant. Therefore, **Mitigation Measures (MM) AES-1; MM-BIO-1** through **MM-BIO-6; MM-CR-1** through **MM-CR-4; MM-GEO-1 through MM-GEO-3; MM-HAZ-1; MM-WAT-1** through **MM-WAT-6; MM-NOI-1** through **MM-NOI-2; MM-TCR-1** would reduce impacts to conflicts with any land use plan, policy, or regulations to less than significant with mitigation. Therefore, with implementation of all mitigation included in the EIR, the proposed project would not have a considerable contribution to any cumulative land use or planning impact.

3.9.5 Mitigation Measures

The project would require the implementation of **MM-AES-1; MM-BIO-1** through **MM-BIO-6; MM-CR-1** through **MM-CR-4; MM-GEO-1 through MM-GEO-3; MM-HAZ-1; MM-WAT-1** through **MM-WAT-6; MM-NOI-1** through **MM-NOI-2; MM-TCR-1** to reduce impacts conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect to a less than significant level.

3.9.6 Level of Significance After Mitigation

As discussed above, portions of the trail would traverse areas designated ESHA, which could result in a conflict with resource protection policies related to ESHA, unless appropriate mitigation is incorporated. MM-BIO-1 through MM-BIO-4 (see Section 3.3) prescribes required mitigation measures to satisfy requirements found in City and County policies governing ESHA. In addition, impacts due to conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect would be potentially significant. Therefore, **MM AES-1; MM-BIO-1** through **MM-BIO-6; MM-CR-1** through **MM-CR-4; MM-GEO-1** through **MM-GEO-3; MM-HAZ-1; MM-WAT-1** through **MM-WAT-6; MM-NOI-1** through **MM-NOI-2; MM-TCR-1** would reduce impacts to conflicts with any land use plan, policy, or regulations. The residual impact to land use and planning would be **less than significant.**

3.10 Noise and Vibration

This section defines terminology used in the discussion of noise and vibration, describes the noise and vibration conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project.

3.10.1 Existing Conditions

The assessment of sound and vibration involves terminology that may be unfamiliar to the general public. In order to assist the reader, the following discussion is presented on the fundamentals of sound and vibration. A description of existing noise levels is also provided.

3.10.1.1 Fundamentals of Sound

Vibrations, traveling as waves through air from a source, exert a force perceived by the human ear as sound. Sound pressure level (referred to as sound level) is measured on a logarithmic scale in decibels (dB) that represent the fluctuation of air pressure above and below atmospheric pressure. Frequency, or pitch, is a physical characteristic of sound and is expressed in units of cycles per second or hertz (Hz). The normal frequency range of hearing for most people extends from about 20 to 20,000 Hz. The human ear is more sensitive to middle and high frequencies, especially when the noise levels are quieter. As noise levels get louder, the human ear starts to hear the frequency spectrum more evenly. To accommodate for this phenomenon, a weighting system to evaluate how loud a noise level is to a human was developed. The frequency weighting called “A” weighting is typically used for quieter noise levels which de-emphasizes the low frequency components of the sound in a manner similar to the response of a human ear. This A-weighted sound level is called the “noise level” and is referenced in units of dBA.

Since sound is measured on a logarithmic scale, a doubling of sound energy results in a 3 dBA increase in the noise level. Changes in a community noise level of less than 3 dBA are not typically noticed by the human ear. Changes from 3 to 5 dBA may be noticed by some individuals who are extremely sensitive to changes in noise. A 5 dBA increase is readily noticeable (Caltrans 2013). The human ear perceives a 10 dBA increase in sound level as a doubling of the sound level (i.e., 65 dBA sounds twice as loud as 55 dBA to a human ear).

An individual’s noise exposure occurs over a period of time; however, noise level is a measure of noise at a given instant in time. Community noise sources vary continuously, being the product of many noise sources at various distances, all of which constitute a relatively stable background or ambient noise environment. The background, or ambient, noise level gradually changes throughout a typical day, corresponding to distant noise sources, such as traffic volume, as well as changes in atmospheric conditions.

Noise levels are generally higher during the daytime and early evening hours when traffic (including airplanes), commercial, and industrial activity is the greatest. However, noise sources experienced during nighttime hours when background levels are generally lower can be potentially more conspicuous and irritating to the receiver. In order to evaluate noise in a way that considers periodic fluctuations experienced throughout the day and night, a concept termed “community noise equivalent level” (CNEL) was developed, wherein noise measurements are weighted, added, and averaged over a 24-hour period to reflect magnitude, duration, frequency, and time of occurrence. A complete definition of CNEL and other terminology used to describe noise is provided in Table 3.9-1.

Table 3.9-1. Definitions of Acoustical Terminology

Term	Definition
Decibel (dB)	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of two like quantities
Sound Pressure Level (SPL)	10 times the logarithm to the base 10 of the ratio between the square of the sound to the square of the reference sound pressure of 20 µPascals. Sound pressure level is the quantity that is measured by a sound level meter, expressed in dB.
Frequency (Hz)	The number of complete pressure fluctuations per second above and below atmospheric pressure. Normal human hearing is between 20 Hz and 20,000 Hz.
A-Weighted Sound Level (dBA)	SPL in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de- emphasizes low and high frequency components of frequency components of sound in a manner similar to the frequency response of the human ear and correlates well with subjective response to sound. All sound levels in this report are A-weighted.
Noise	Unwanted sound.
Equivalent Sound Level (L_{eq})	The average A-weighted sound level during the measurement period. For this CEQA evaluation, Leq refers to a one-hour period unless otherwise stated.
Lmax, Lmin	The maximum and minimum A-weighted sound level during the measurement period.
L01, L10, L50, L90	The A-weighted sound levels that are exceeded l%, l0%, 50%, and 90% of the time during the measurement period.
Day/Night Noise Level (L_{dn})	The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured during the night between 10:00 p.m. and 7:00 a.m.
Community Noise Equivalent Level (CNEL)	The average A-weighted sound level during a 24-hour day, obtained after addition of 5 decibels in the evening from 7:00 p.m. to 10:00 p.m. and after addition of 10 decibels to sound levels during the night between 10:00 p.m. and 7:00 a.m.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Impulsive Noise	Noise loud enough to disrupt normal activities and usually lasting less than one second.

Exterior Noise Distance Attenuation

Noise sources are classified in two forms: (1) point sources, such as stationary equipment or a group of construction vehicles and equipment working within a spatially limited area at a given time, and (2) line sources, such as a roadway with a large number of pass-by sources (motor vehicles). Sound generated by a point source typically diminishes (attenuates) at a rate of 6.0 dBA for each doubling of distance from the source to the receptor at acoustically “hard” sites and at a rate of 7.5 dBA for each doubling of distance from source to receptor at acoustically “soft” sites. Sound generated by a line source (i.e., a roadway) typically attenuates at a rate of 3 dBA and 4.5 dBA per doubling distance, for hard and soft sites, respectively. Sound levels can also be attenuated by man-made or natural barriers. For the purpose of sound attenuation discussion, a “hard” or reflective site does not provide any excess ground-effect attenuation and is characteristic of asphalt or concrete ground surfaces, as well as very hard-packed soils. An acoustically “soft” or absorptive site is characteristic of unpaved loose soil or vegetated ground.

3.10.1.2 Fundamentals of Vibration

Vibration is an oscillatory motion that can be described in terms of displacement, velocity, or acceleration. The response of humans to vibration is very complex. However, it is generally accepted that human response is best approximated by the vibration velocity level associated with the vibration occurrence.

Heavy equipment operation, including stationary equipment that produces substantial oscillation or construction equipment that causes percussive action against the ground surface, may be perceived by building occupants as perceptible vibration. It is also common for ground-borne vibration to cause windows, pictures on walls, or items on shelves to rattle. Although the perceived vibration from such equipment operation can be intrusive to building occupants, the vibration is seldom of sufficient magnitude to cause even minor cosmetic damage to buildings.

When evaluating human response, ground-borne vibration is usually expressed in terms of root mean square (RMS) vibration velocity. RMS is defined as the average of the squared amplitude of the vibration signal. As for sound, it is common to express vibration amplitudes in terms of decibels defined as:

$$L_v = 20 \log \left(\frac{v_{rms}}{v_{ref}} \right)$$

Where vrms is the RMS vibration velocity amplitude in inches/second and vref is the decibel reference of 1x10-6 inches/second.

To avoid confusion with sound decibels, the abbreviation VdB is used for vibration decibels. The vibration threshold of perception for most people is around 65 VdB (which is equivalent to 0.0018 in/sec RMS). Vibration levels in the 70 to 75 VdB range are often noticeable, but generally deemed acceptable, and levels in excess of 80 VdB are often considered unacceptable (FTA 2018).

Vibration impacts to buildings are generally discussed in terms of peak particle velocity (PPV) that describes particle movement over time (in terms of physical displacement of mass, expressed as inches/second or in/sec). Groundborne vibration generated by construction projects is usually highest during pile driving, rock blasting, soil compacting, jack hammering, and demolition-related activities. Next to pile driving and soil compacting, grading activity has the greatest potential for vibration impacts if large bulldozers, large trucks, or other heavy equipment are used. A conservative maximum vibration level standard is 0.2 in/sec PPV for the prevention of structural damage to typical residential buildings (Caltrans 2020).

3.10.1.3 Existing Noise Conditions

Project Site Noise Levels

Existing noise levels in the City of Carpinteria and surrounding County of Santa Barbara area are affected by several different sources of noise, including automobile and rail traffic, agricultural and industrial activity, and periodic sources such as construction. The major noise sources in Carpinteria are transportation related noise sources, including US Highway 101, freight and passenger railroad service and major arterial roads.

The City of Carpinteria General Plan/Local Coastal Land Use Plan Noise Contour Maps and County of Santa Barbara Noise Element Noise Contour Maps indicate that the proposed project is located within the boundaries for the 65 - 70 dBA noise contour for existing and future conditions (City of Carpinteria 2003; County of Santa Barbara 2009). US Highway 101 and the UPRR are the predominant noise sources in the project area. See Appendix H of this Environmental Impact Report (EIR) for the contour maps described.

3.10.2 Relevant Plans, Policies, and Ordinances

3.10.2.1 Federal

The following federal regulations pertaining to noise would apply to the proposed project.

Federal Highway Administration (FHWA) Standards

CFR Title 23, Part 772 sets procedures for the abatement of highway traffic noise and construction noise. Title 23 is implemented by the U.S. Department of Transportation (DOT) Highway Administration (FHWA). The purpose of this regulation is to provide procedures for noise studies and noise abatement measures to help protect the public health and welfare, to supply noise abatement criteria, and to establish requirements for information to be given to local officials for use in the planning and design of highways. All highway projects which are developed in conformance with this regulation shall be deemed to be in conformance with the DOT-FHWA Noise Standards. Title 23 establishes a 67 dBA $L_{eq}(h)$ standard applicable to federal highway projects for evaluating impacts to land uses including residences, recreational uses, hotels, hospitals, and libraries [23 CFR Chapter 1, Part 772, Section 772.19].

Federal Transit Administration (FTA) and Federal Railroad Administration (FRA) Standards

Although the FTA standards are intended for federally funded mass transit projects, the impact assessment procedures and criteria included in the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual (FTA 2018) are routinely used for projects proposed by local jurisdictions. The FTA and Federal Railroad Administration (FRA) have published guidelines for assessing the impacts of ground-borne vibration associated with rail projects, which have been applied by other jurisdictions to other types of projects. The FTA measure of the threshold of architectural damage for conventional wood-frame construction (i.e., most residences) is 0.2 inch/second peak particle velocity (PPV).

3.10.2.2 State

The following state regulations pertaining to noise would apply to the proposed project.

California Noise Control Act of 1973

Sections 46000 through 46080 of the California Health and Safety Code, known as the California Noise Control Act of 1973, declares that excessive noise is a serious hazard to the public health and welfare and that exposure to certain levels of noise can result in physiological, psychological, and economic damage. It also identifies a continuous and increasing bombardment of noise in the urban, suburban, and rural areas. The California Noise Control Act declares that the State of California has a responsibility to protect the health and welfare of its citizens by the control, prevention, and abatement of noise. It is the policy of the state to provide an environment for all Californians free from noise that jeopardizes their health or welfare.

California Noise Insulation Standards (CCR Title 24)

In 1974, the California Commission on Housing and Community Development adopted noise insulation standards for hotels, motels, dormitories, and multifamily residential buildings (CCR Title 24, Part 2). Title 24 establishes standards for interior room noise (attributable to outside noise sources). The regulations also specify that acoustical studies must be prepared whenever a multifamily residential building or structure is proposed to be located in an

area with CNEL (or L_{dn}) of 60 dBA or greater. Such acoustical analysis must demonstrate that the residence has been designed to limit intruding noise to an interior CNEL (or L_{dn}) of at least 45 dBA (California's Title 24 Noise Standards, Chap. 2-35). The City of Sacramento applies the interior noise criterion of CNEL 45 dBA for single-family residences, in addition to multifamily residential structures.

3.10.2.3 Local

The following local/regional regulations pertaining to noise would apply to the proposed project.

City of Carpinteria General Plan/Local Coastal Land Use Plan 2003

The Noise Element of the *City of Carpinteria General Plan/Local Coastal Land Use Plan* provides objectives, policies, and programs regarding Noise, including the following:

Objective N-5: The City will minimize the effects of nuisance noise effects on sensitive land uses.

N-5a. The City will address nuisance on a case-by-case basis and develop appropriate mitigation measures such as scheduling of events or activities during hours when effects would be minimal.

N-5b. The City will require that construction activities adjacent to sensitive noise receptors be limited as necessary to prevent adverse noise impacts.

N-5c. The City will require that construction activities employ techniques that minimize the noise impacts on adjacent uses.

The *City of Carpinteria General Plan/Local Coastal Land Use Plan* provides guidelines for determining whether or not ambient noise levels are compatible with certain land uses in the City. The guidelines indicate the compatibility of noise-sensitive land uses in areas subject to noise levels of 55 to 80 dB CNEL or L_{dn}. Residential uses are normally unacceptable in areas exceeding 70 dB CNEL; and conditionally acceptable between 60 - 70 dB CNEL for multifamily units. Schools, libraries, hospitals, and nursing homes are treated as noise-sensitive land uses, with normally acceptable levels up 60 dB CNEL, and conditionally acceptable levels up to 70 dB CNEL. Commercial/professional office buildings and recreational uses such as golf courses and water recreation have normally acceptable levels up 75 dB CNEL (City of Carpinteria 2003).

City of Carpinteria Municipal Code

The *City of Carpinteria Municipal Code Title 12 – Streets, Sidewalks, and Public Places,* including *Chapter 12.04 – Street Construction and Excavation, Section 12.04.410 – Noise, dust, and debris requirements,* describes the noise standards that are applicable public works construction activity within the City. In addition, *Section 15.16.170 – Hours during which construction may occur, and Section 15.16.180 Exemption — after-hours or emergency permits,* apply to any construction for which a permit is required by the City. The following excerpts from the municipal code are applicable to the project (City of Carpinteria 2020):

> **12.04.410 – Noise, dust, and debris requirements**
>
> Each permittee shall conduct and carry out work permitted under this chapter in such manner as to avoid unnecessary inconvenience and annoyance to the general public and occupants of

neighboring property. The permittee shall take appropriate measures to reduce to the fullest extent practicable in the performance of the work, noise, dust and unsightly debris. During the hours of ten p.m. to seven a.m. the permittee shall not use, except with the express written permission of the engineer, or in case of an emergency as otherwise provided in this chapter, any tool, appliance or equipment producing noise of sufficient volume to disturb the sleep or repose of occupants of the neighboring property.

15.16.170 - Hours during which construction may occur.

Any person conducting construction work for which a permit is required pursuant to Titles 14 and 15 shall comply with the following:

A. Construction activities shall be allowed Mondays through Fridays from 7:00 a.m. to 8:00 p.m.;

B. Construction activities shall be allowed on Saturdays from 8:00 a.m. to 8:00 p.m.;

C. Construction activities shall be allowed on Sundays from 10:00 a.m. to 8:00 p.m.

15.16.180 - Exemption; after-hours or emergency permits.

A. The community development director or designee may issue an after-hours construction permit authorizing work, if the director determines that the public interest will be served by such a permit or in the case of an emergency. An after-hours construction permit may be revoked or suspended by the director, or his designee, if it is determined that the activity detrimentally affects the public health, safety, and welfare.

B. The planning commission, or community development director, may impose more restrictive hours of construction as a condition of approval in its action on permits issued pursuant to Titles 14 and 15 hereof.

Santa Barbara County Comprehensive Plan Noise Element

The Noise Element of the Comprehensive Plan establishes maximum long-term exterior noise exposure levels for noise sensitive uses, and also identifies the land uses considered to be noise sensitive. The following Noise Element Policies are considered applicable to the Project.

1) In the planning of land use, 65 dB Day-Night Average Sound Level should be regarded as the maximum exterior noise exposure compatible with noise-sensitive uses unless noise mitigation features are included in project designs.
2) Noise-sensitive land uses should be considered to include:
   a) Residential, including single and multifamily dwellings, mobile home parks, dormitories, and similar uses.
   b) Transient lodging, including hotels, motels, and similar uses.
   c) Hospitals, nursing homes, convalescent hospitals, and other facilities for long-term medical care.
   d) Public or private educational facilities, libraries, churches, and places of public assembly.
6) Residential uses proposed in areas where the Day-Night Average Sound Level is 65 dB or more should be designed so that noise levels in exterior living spaces will be less than 65 dB LDN. An analysis of

proposed projects should be required, indicating the feasibility of noise barriers, site design, building orientation, etc., to meet the prescribed exterior noise standard.

3.10.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to noise are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to noise would occur if the project would:

a) Result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
b) Result in generation of excessive groundborne vibration or groundborne noise levels.
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels.
d) Result in cumulatively considerable noise impacts.

3.10.3.1 Local Significance Thresholds

The *Santa Barbara County Environmental Thresholds and Guidelines Manual* provides noise thresholds for assisting in the determination of significant noise impacts. The following excerpts from the guidelines manual are applicable to the project:

a) A proposed development that would generate noise levels in excess of 65 dB(A) CNEL and could affect sensitive receptors would generally be presumed to have a significant impact.
b) A project will generally have a significant effect on the environment if it will increase substantially the ambient noise levels for noise-sensitive receptors adjoining areas. Per item a., this may generally be presumed when ambient noise levels affecting sensitive receptors are increased to 65 dB(A) CNEL or more. However, a significant effect may also occur when ambient noise levels affecting sensitive receptors increase substantially but remain less than 65 dB(A) CNEL, as determined on a case-by-case level.
c) Noise from grading and construction activity proposed within 1,600 feet of sensitive receptors, including schools, residential development, commercial lodging facilities, hospitals or care facilities, would generally result in a potentially significant impact. According to EPA guidelines, average construction noise is 95 dB(A) at a 50' distance from the source. A 6 dB drop occurs with a doubling of the distance from the source. Therefore, locations within 1,600 feet of the construction site would be affected by noise levels over 65 dB(A). To mitigate this impact, construction within 1,600 feet of sensitive receptors shall be limited to weekdays between the hours of 8 AM to 5 PM only. Noise attenuation barriers and muffling of grading equipment may also be required. Construction equipment generating noise levels above 95 dB(A) may require additional mitigation.

3.10.4 Impact Analysis

a) Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

On-Site Construction Noise (Temporary)

Construction of the proposed project would generate noise that could expose nearby receptors (i.e., residences and commercial uses) to elevated noise levels that may disrupt communication and routine activities. The magnitude of the impact would depend on the type of construction activity, equipment, duration of the construction phase, distance between the noise source and receiver, and intervening structures. Noise from construction equipment generally exhibits point source acoustical characteristics. A point source sound is attenuated (or reduced) at a rate of 6 decibels per doubling of distance from the source for "hard site" conditions and at 7.5 decibels per doubling of distance for "soft site" conditions. These rules apply to the propagation of sound waves with no obstacles between source and receivers, such as topography (ridges or berms) or structures. The range of maximum noise levels for various types of construction equipment is provided in Table 3.9-2. Typical operating cycles may involve two minutes of full power, followed by three or four minutes at lower levels.

Table 3.9-2. Construction Equipment Noise Emission Levels

Equipment	Typical Maximum Sound Level - 50 feet from Source(L_{max} dB)
Air Compressor	81
Backhoe	80
Compactor	82
Concrete Mixer	85
Crane, Mobile	83
Dozer	85
Generator	81
Grader	85
Loader	85
Paver	89
Roller	74
Saw	76
Scraper	89
Truck	88

Source: FTA 2018

The nearest point of construction activities to the closest noise-sensitive receivers would be approximately 775 feet south of the project site, at the Rincon Point residential neighborhood.. Although construction of the trail elements would largely occur at greater distances from this closest residence, this distance was used as the worst-case scenario to conservatively model construction noise impacts at the nearest residential receptors at Rincon Point.

Noise-sensitive receivers proximate to the project, but north of US Highway 101 (i.e., commercial and residential), will not experience significant noise impacts from construction activities as these residences

and commercial businesses are located within the 70 dBA noise contour, as indicated in the City of Carpinteria General Plan/Coastal Land Use Plan Noise Contour Maps and County of Santa Barbara Noise Element Contour Map. Potential project-generated construction noise would not be audible over US Highway 101 traffic noise. Nonetheless, construction-related noise levels were modeled at these closest residential and commercial receivers to the north of the project; construction activity noise levels are summarized in Table 3.9-3, with the modeling input and results contained in Appendix H of this EIR.

The Federal Highway Administration's Roadway Construction Noise Model (RCNM) (FHWA 2008) was used to estimate construction noise levels at these noise-sensitive land uses. Although the model was developed by the FHWA, RCNM is often used for non-roadway projects, because the same types of construction equipment used for roadway projects are also used to construct other project types. Input variables for RCNM consist of the receiver/land use types, the equipment type and number of each (e.g., two graders, a loader, a tractor), the duty cycle for each piece of equipment (e.g., percentage of each hour the equipment typically works per day), and the distance between the construction activity and noise-sensitive receivers. No topographical or structural shielding was assumed in the modeling of construction noise (i.e., the receivers are modelled with no obstacles to the travel of sound between the construction activity and receiver location, a worst-case assumption). The noise levels from the proposed construction activities are summarized in Table 3.9-3. The complete set of RCNM input and output data for construction noise is provided in Appendix H of this EIR.

As shown, at the nearest residences at Rincon Point, noise levels would range from approximately 54 dBA Leq to 60 dBA Leq when construction is taking place at or near the project site boundary (i.e., easternmost part of proposed trail). At the nearest residences to the north of the project, noise levels would range from approximately 56 dBA Leq to 62 dBA Leq when construction is taking place at or near the northern project site boundary; these levels would range from approximately 56 dBA Leq to 62 dBA Leq at the commercial properties to the north of the project. These heavy construction equipment noise levels are based on surveys, conducted by the U.S. Environmental Protection Agency in 1971. Mostly because of more stringent recent air quality emissions standards, newer, cleaner, and quieter equipment is used on most construction projects in California. Thus, construction phase noise levels indicated in Table 3.9-3 represent "worst-case" conditions. As the table shows, the highest noise levels are expected to occur during the site prep, grading, and paving phases of construction.

Table 3.9-3. Outdoor Construction Noise Levels by Phase at Nearest Receptors

Construction Phase	Residences South (dB L_{eq})	Residences North (dB L_{eq})	Commercial North (dB L_{eq})
Site Prep	60	62	61
Grading	60	62	61
Trail Construction	57	59	58
Bridge Construction	54	56	56
Paving	57	60	59

Source: Appendix H.

The County of Santa Barbara exempts construction activity noise from standard exterior noise exposure limits, if conducted during specific limited daytime hours. The guideline requires noise generating construction activities (including site prep, grading, and construction), be restricted to the weekday hours between 8:00 a.m. and 5:00 p.m. (County of Santa Barbara 2008); construction is prohibited on weekends and State Holidays.. This ensures that sensitive receptors are not disturbed by early morning or late night activities, or by activities

on the weekends or during State holidays. The noise from construction activities incident upon Rincon Point residences is subject to these thresholds as the residences are located in Santa Barbara County.

As discussed, ambient and future noise levels affecting noise-sensitive land uses adjacent to the project are characterized by a 70 dBA roadway noise contour. Based on the noise level values at the nearest sensitive receptor, which represent "worst-case" scenario noise exposure over the construction cycle, daytime construction noise levels would average approximately 12 dBA lower than ambient noise levels. However, construction noise levels in the evening or overnight period could be plainly audible above background levels and could also result in sleep disturbance for residential occupants. Therefore, temporary construction noise impacts are potentially significant. **Mitigation Measure (MM) NOI-1** and **MM-NOI-2** are required in order to reduce construction noise impacts. Impacts would be **less than significant with implementation of mitigation**.

Off-Site Construction Traffic Noise (Temporary)

Construction of the proposed project would generate haul truck trips and construction employee vehicle trips to and from the project site. Fill would be accomplished with on-site cut material. Haul trucks with an approximately 16 cubic yard capacity would export excess cut to the closest disposal site. Heavy truck traffic is anticipated to be approximately 20 heavy truck trips (10 truckloads, each with a round-trip to/from the site) a day during the grading and excavation phase of the project. This averages to 2.5 trips per hour over an 8-hour workday, with 3 trips per hour a reasonable worst-case scenario. Within the northern half of the project, north of the UPRR alignment, haul trucks would access the site via the SR150 interchange from US Highway 101 northbound or southbound. The closest residence to the SR150 northbound off-ramp from US Highway 101 is located at approximately 180 feet (off Camino Carreta). For the southern half of the project, haul trucks would navigate through the Rincon Beach County Park parking lot and use the Bates Road interchange with US Highway 101. Haul trucks traveling through Rincon Beach County Park would pass within 125 feet of the closest Rincon Point residences.

From data presented in Table 3.9.2, a heavy dump truck generates a maximum sound level of 88 dBA at 50 feet. This maximum would be reduced to 80 dBA at 125 feet and 77 dBA at 180 feet. Assuming a truck is at the minimum identified distance from the Rincon Point neighborhood home for approximately 1 minute while driving by, and three trucks pass during the busiest hour, the average noise at this home from haul truck operations would be 67 dBA Leq. Assuming a truck is at the minimum identified distance from the Camino Carreta home for approximately 1 minute while driving by, and three trucks pass during the busiest hour, the average noise at this home from haul truck operations would be 64 dBA Leq. These noise levels are very similar, and slightly below, the daytime noise levels at these residences associated with traffic along US Highway 101. Thus, daytime operations of heavy haul trucks to export material from the site would not be anticipated to result in substantial temporary noise increases at the closest sensitive receptors to the local portions of the haul route. However, haul trucks operating in the evening or overnight period could be plainly audible above background levels and could also result in sleep disturbance for residential occupants. Therefore, temporary off-site construction traffic noise impacts related to haul truck operations are potentially significant. **MM-NOI-1** is required in order to reduce construction traffic noise impacts from haul truck operations that could potentially occur in the evening or overnight periods. Impacts would be **less than significant with implementation of mitigation**.

Permanent Noise Increases – Landform Modification and Trail Operations

Members of the public have expressed concerns in responses to the Notice of Preparation (NOP) that noise levels associated with US Highway 101 and UPRR operations could increase in the Rincon Point neighborhood

as a result of the proposed project grading. The effectiveness of a noise barrier, including a solid ridge, depends upon the height of the top of the barrier, relative to the elevation of the noise source (on one side of the barrier) and the noise receiver (on the other side of the barrier). The proposed grading for the trail project would alter the angle of the slope face along the trail alignment, but it would not decrease the elevation of the top of the ridge along the trail. The proposal would also have no effect upon the elevation of the US Highway 101 travel lanes, the elevation of the UPRR tracks, or the elevation of the homes within the Rincon Point residential neighborhood. Consequently, the proposed project grading would have **no impact** on the transportation-related ambient noise levels in the Rincon Point residential neighborhood or along Rincon Beach County Park.

Operation of the project would involve pedestrian and cyclist use of the trail and related amenities; neither hiking nor cycling generate substantial noise, and the closest noise-sensitive receivers (residents within Rincon Point) already experience similar noise sources from use of Rincon Beach County Park. Consequently, trail users are expected to generate an incremental increase in the noise levels adjacent to proximate residences, resulting in permanent noise level increases that are **less than significant.**

b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Construction (Short-Term) Vibration

For construction vibration, this analysis used the FTA threshold for structural damage (vibration-peak-particle velocities greater than 0.2 inches per second for residences, which equates to the Caltrans standard for sensitive structures) and FTA's threshold for human annoyance within residences (80 vibration velocity level in decibels (VdB) at residences where people normally sleep).

During grading, construction, and paving activities for the proposed project ground-borne vibration would be produced by heavy-duty construction equipment. The most important equipment relative to generation of vibration, and the vibration levels produced by such equipment, are illustrated in Table 3.9-4.

Table 3.9-4. Vibration Velocities for Typical Construction Equipment

Equipment	PPV at 25 Feet (Inches Per Second)	Approximate Ground Vibration Level 25 feet (VdB)
Large Bulldozer	0.089	87
Loaded Trucks	0.076	86
Drill Rig / Auger	0.089	58
Jackhammer	0.035	87
Small Bulldozer	0.003	79

Source: FTA 2018; Caltrans 2020.

As shown in Table 3.9-4, use of heavy equipment (e.g., a large bulldozer) generates vibration levels of 0.089 inches per second PPV at a distance of 25 feet. The nearest residences to construction activity for the eastern trail portion would be at Rincon Point, approximately 775 feet south. Additionally, haul trucks traveling through Rincon Beach County Park would pass within 125 feet of the closest Rincon Point residences. The nearest residences to the trail construction activity could experience vibration levels of 0.0004 inches per second PPV during bulldozer operations. The closest residence to the haul route for loaded trucks traveling through Rincon Beach County Park could experience vibration levels of 0.007 inches per second PPV during loaded truck pass-by. Vibration levels at these receptors would not begin to approach the FTA or Caltrans building damage threshold of 0.2 inches per second PPV (the FTA uses this value for standard construction residences, Caltrans uses it for fragile or sensitive structures).

At 125 feet (the closest residences to the truck haul route), vibration levels from a loaded truck would be reduced to approximately 66 VdB; as such the vibration levels would also be well below the level considered barely perceptible to persons (80 VdB), and therefore should generally not be discernible to area residents. While some persons particularly sensitive to vibration may perceive some vibration episodes during certain construction activities, vibration levels would not be anticipated to reach annoyance levels for residents along the project alignment. Ground-borne vibration would not be associated with the proposed project following construction activities. Therefore, impacts related to ground-borne vibration would be **less than significant**.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

The proposed project would not expose people residing or visiting in the project area to excessive noise levels from aircraft. The nearest public airport is Santa Barbara Airport, located approximately 30 miles northwest of the project site. There are no private airports in the vicinity of the project site. As such, **no impacts** from airport/aircraft noise would occur.

d) Would the project result in cumulatively considerable noise impacts?

Cumulative development throughout the Carpinteria Valley would incrementally contribute to noise impacts. However, noise analysis for the project indicates that future noise conditions will not exceed the City's or County's established parameters with the identified mitigation. In addition, the measures identified to reduce short term construction noise impacts would reduce the project's contribution to cumulative noise impacts on nearby sensitive receptors. Therefore, the project would not have considerable contributions toward any cumulative noise impacts.

3.10.5 Mitigation

To reduce potential noise impacts, the following mitigation measures shall be implemented:

MM-NOI-1 **Construction Hours.** Construction activity for site preparation and for future development shall be limited to the hours between 8:00 a.m. and 5:00 p.m., Monday through Friday. No construction shall occur on state holidays (e.g., Thanksgiving, Labor Day) or weekends. Construction equipment maintenance shall be limited to the same hours. Non-noise generating construction activities are not subject to these restrictions.

Plan Requirements*:** Two signs stating these restrictions shall be posted on site at each end of the proposed trail. ***Timing: Signs shall be in place prior to the beginning of and throughout all grading and construction activities. ***Monitoring***: City and County Grading Inspectors shall spot check and respond to complaints.

MM-NOI-2 **Construction Equipment**. All construction equipment with engines must have original manufacturer's approved muffling devices. All stationary equipment shall be physically buffered from nearby sensitive receptors.

Plan Requirements: Plans shall indicate the requirement of OEM muffled equipment. ***Timing***: This condition applies when any engine driven equipment is in use at the project site during construction. ***Monitoring***: City and County Grading Inspectors shall spot check and respond to complaints.

3.10.6 Level of Significance After Mitigation

After implementation of **MM-NOI-1** and **MM-NOI-2**, impacts to nearby noise- sensitive receptors during construction activity would be less than significant.

INTENTIONALLY LEFT BLANK

3.11 Recreation

This section describes the recreational conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the project.

3.11.1 Existing Conditions

The City of Carpinteria Parks and Recreation Department's recent history of park and trail development dates back to 1985. In 2009, the City completed a Project Study Report (PSR) on a Rincon Trail project (City of Carpinteria 2009a). In January 2010, the Carpinteria City Council approved the 2010 Parks Department Work Plan, which includes plans to complete the Rincon segment of the Carpinteria Coastal Vista Trail. As of December 2017, five miles of the Carpinteria Coastal Vista Trail have been constructed (California Coastal Conservancy 2017). The proposed trail would link the City's trail and an existing Rincon Beach County Park.. The Rincon Beach County Park's parking lot can be very crowded on summer weekends when beach use is high, or during the winter when surfing conditions are favorable. The proposed trail would provide a safe route for alternative transportation between the City and the Rincon Beach County Park; a current unsanctioned trail between these two points is interrupted by the Union Pacific Railroad (UPRR) rail corridor that bisects the central portion of the trail alignment, and which poses a significant safety hazard for pedestrians that trespass across the UPRR tracks. Establishment of the proposed trail would remove the attractive nuisance of illicit crossing of the tracks by pedestrians.

There are several types of recreation-oriented open space in the project vicinity, including areas that are located in and maintained by the City, private entities, and state or county agencies.

- Public parks: state, county and local
- Natural areas publicly owned or privately owned with public access easements
- Undeveloped vacant lots, privately owned
- Privately owned recreational facilities
- School playgrounds and ball fields
- Trails: equestrian, bicycle, jogging and walking, and
- Coastal access and beaches.

Carpinteria is a city of approximately 13,000 people, with close to two million visitors a year due to the popularity of the area's beaches, parks, and campground. Carpinteria has approximately 97.96 acres of City parks within the City boundary. Carpinteria State Beach is also within the City boundary. Carpinteria offers a variety of opportunities for coastal recreation. Downtown shops and restaurants draw visitors, as well as opportunities for surfing, fishing, bird watching, wildlife viewing, and walking on nearby beaches. A number of special events take place in Carpinteria each year, including the California Avocado Festival and the Rincon Classic Surf Competition. The State Beach facilities are primarily used by out-of-town campers and local residents share the beachfront picnicking, restrooms, and beach day use area (City of Carpinteria 2003). Additional nearby recreational facilities outside of the City and within the County of Santa Barbara (County) include Rincon Beach County Park, located to the south of the project site and within the County of Santa Barbara, and Rincon Point State Beach, located 0.4 miles southeast of the project site.

The City of Carpinteria has a total of 6.75 bikeway miles, including 6.25 miles of formal street bikeway facilities and 0.5 miles of off-street bikeway facilities. Cycling and walking to recreational sites promotes direct interface with the physical environment and benefits the community ecologically. Class I bikeways are trails or paths that have entirely separate rights of way from automobile roadways for the use of bicycles and pedestrians. The paths minimize crossflow with vehicle traffic and can be located in parks, recreational areas, or road rights-of-way if such width permits (City of Carpinteria 2003). The proposed shared use path would be designed as a Class I bikeway for use by cyclists and pedestrians.

In 2009, the City completed a Coastal Access Feasibility Study to analyze the feasibility of new sanctioned access points to connect Carpinteria's beaches and coastal resources with the rest of the community, determine potential railroad crossing alternatives, refine and prioritize alternatives based on public input, and create an implementation plan (City of Carpinteria 2009b). The study was needed because of the "barrier effect" of the rail corridor on the City, the increased public use of the coast, the level of current and predicted passenger and freight train traffic with increased potential risk of conflict at uncontrolled crossings, the limited number of sanctioned crossings, and the hazardous practice of trespassing over railroad tracks to reach coastal destinations. The study has resulted in a number of specific recommendations and preliminary designs for crossings, including the proposed crossing in the Coastal Vista Trail Rincon segment.

In 2010, the City completed an Open Space Management Plan for the City-owned Carpinteria Bluffs Nature Preserve and Tar Pits Park properties (California Coastal Conservancy 2010). The Open Space Management Plan includes a public access element and lays out the City's vision for completion of the larger Carpinteria Coastal Vista Trail. In the meantime, the City has pursued completion of other segments of the Carpinteria Coastal Vista Trail, all of which have undergone extensive public hearings to receive Coastal Development Permits. Notable recent accomplishments with respect to regional bike circulation include the completion of the Class I bike path from Rincon Beach County Park to Mobil Pier in Ventura County and the extension of a new all-weather bike path from the Casitas Pass Road/Via Real intersection to Carpinteria Avenue along Carpinteria Creek (as part of the Linden Avenue and Casitas Pass Road Interchanges and Via Real Extension project). Both of these bike paths would connect to the proposed Rincon Trail project. In conjunction with the US 101 South Coast High Occupancy Vehicle project, the Santa Claus Lane bike path connecting Santa Claus Lane to the west end of Carpinteria Avenue will be constructed. A trail easement also has been acquired by the City along the S&S Seeds property (6155 Carpinteria Avenue) and anticipates acquiring an easement across the adjacent vacant commercial property (6175 Carpinteria Avenue) as part of a currently proposed development project, and the Land Trust for Santa Barbara County has acquired the former Carpinteria Bluffs III 21.65-acre parcel at the eastern Carpinteria Avenue terminus, which has been transferred to the City of Carpinteria as permanent public open space to be known as Rincon Bluffs Preserve.

The proposed Carpinteria Rincon trail segment of the Carpinteria Coastal Vista Trail will ultimately connect with the Carpinteria Bluffs Nature Preserve (Preserve) portion of the trail constructed in 2004. This segment was constructed as a condition of the Coastal Development Permit for the Preserve allowing development of a parking area, baseball fields, and restroom building (California Coastal Conservancy 2010). The Carpinteria Bluffs Nature Preserve trail segment was planned and built to connect to the subject Carpinteria Rincon Trail segment, which provides a dedicated bridge across UPRR and a contiguous trail to Rincon Beach County Park.

The portion of the project site within the City has a General Plan/Coastal Land Use Plan land use designation of Visitor-Serving Commercial (City of Carpinteria 2003) and has been zoned for Resort Zone District use (City of Carpinteria 2016). A public multi-use trail would be an allowed use under the visitor serving land use designation. The portion of the project within the County of Santa Barbara is designated as Other Recreation/Open Space and is zoned Transportation Corridor and Recreation (County of Santa Barbara 2009). The County transportation

corridor zoning reflects the presence of current and former transportation facilities within the project site, while open space and recreation land use designations reflect the desire to accommodate coastal oriented recreation on the project site and vicinity.

A number of comments were submitted by members of the paragliding and hang-gliding community (or more simply the soaring community) indicating that wind uplift conditions associated with the ocean bluffs along the project trail alignment provide opportunities above the proposed trail properties for paragliding and hang gliding. Comment letters assert that such soaring activities have been carried out in the air space over the trail alignment property for several decades, and that the air space is one of a limited number of opportunities for soaring within the coastal environment in Santa Barbara County. While paragliders and hang-gliders have capitalized on bluff-related uplift during favorable wind conditions to launch from private properties along the bluff faces above the proposed bicycle and pedestrian path alignment, the proposed trail corridor has been dedicated to transportation uses since its construction in the late 1800s (railroad then state highway). Therefore, while the soaring community has taken advantage of favorable wind and uplift phenomena associated with the existing topography within the trail corridor, neither launching nor landing areas within the trail corridor have been contemplated or formalized in recreation plans adopted by the City of Carpinteria or County of Santa Barbara. It should be noted that the steep slopes in the southern trail alignment are the result of former landform modification carried out for the railroad alignment and former state highway, and do not represent natural conditions resulting from natural weathering of the involved earth materials and geologic formation. Please refer to Section 3.5 (Geology & Soils) for a detailed description of landform modification that has occurred within the trail alignment. One reason for not proposing formal launching or landing areas for soaring activities is the presence of U.S. Highway 101 and the UPRR alignment in close proximity to the wind uplift zone associated with the bluff face. Paragliders and hang-gliders launching from an elevation not much greater than these transportation facilities have little time to react if wind conditions are not as expected or change, representing possible safety hazards for paragliders and hang-gliders that find themselves forced to land within the freeway or railroad corridors. With respect to the presence of these major transportation corridors, the area is not ideal for ensuring the safety of low altitude paragliders and hang-gliders taking advantage of the bluff-related wind uplift conditions.

It should be noted that Rincon County Beach Park prohibits the take-off or landing of any type of gliders. In addition, UPRR prohibits pedestrian access across their alignment (precluding direct access to the bluff area that generates the best uplift). Thus, the typical launch area for paragliding and hang gliding to gain access to the air space over the trail alignment is currently from private property adjacent to the trail alignment, not from a sanctioned use public property. The private property owner also retains the option of prohibiting paragliders and hang gliders from using the property as a launch area at any time.

Fundamentals of Paragliding or Hang-Gliding

Because members of the soaring community have indicated the air space above the trail alignment has been used extensively for paragliding and hang-gliding, the following fundamental discussion is provided to assist the general public in understanding this issue.

Many people not involved in soaring tend to make the assumption that a lot of wind is needed in order for successful paragliding or hang-gliding to occur. Wind is not essential for this type of soaring but can extend the length of time aloft for an individual flight (BHPA 2021). The presence of wind also can facilitate launch, much the same as for kite flying. With less or no wind present, a paraglider or hang-glider will have to run in order to establish enough relative air speed over the “wing” of the glider to produce lift (BHPA 2021). Launch areas for paragliders and hang-gliders often incorporate a long unobstructed slope that both allows the pilot to build up the needed air speed above

the wing, but also increases the elevation of the craft above the ground elevation as the pilot advances. At the top of ridges, cliffs, or bluffs, when the wind direction is against these features, launch can often be accomplished from a stationary position, if the wind speed is already sufficient over the wing to create lift (BHPA 2021).

After takeoff, a glider maintains its airspeed by flying on a descending path through the air, using gravity to propel it. The glide ratio is a measure of a glider's performance. It expresses the relationship between the distance that a glider can travel horizontally (in still air) and the height loss involved. For instance, a glider that has a glide ratio of 10:1 will travel 100 feet horizontally for every ten feet of elevation (height above the ground) lost in still air (BHPA 2021). Wind that has a vertical component in the upward direction, which can be caused when wind strikes a landform, such as a ridge or cliff, can carry a glider to a greater elevation; following the ridge back and forth where a vertical wind component exists a glider can remain in the air longer than under still air conditions.

According to a number of comments received on the notice of preparation by members of the soaring community, the presence of the existing steep ocean bluffs within the trail alignment result in the creation of a favorable vertical wind component above the bluff face. This vertical wind component, or updraft, facilitates the launching of gliders and supports extended flight times by gliders.

3.11.2 Relevant Plans, Policies, and Ordinances

3.11.2.1 Federal

Federal Aviation Regulation Part 103

Hang gliding, paragliding, and mini-wing flights in the United States are governed by the Federal Aviation Regulation (FAR) Part 103, Federal Aviation Regulation, Ultralight Vehicles. FAR Part 103 was adopted July 30, 1982, and formally establishes what is recreational flight. FAR Part 103 does not apply to flights by Federal Aviation Administration (FAA) licensed pilots in FAA registered aircraft, which are governed by FAR Part 61 and FAR Part 91 and may be governed in addition by other civil laws and regulations. Persons participating in hang gliding, paragliding, and mini-wing operations under FAR Part 103 are required by law to fly in accordance with FAR Part 103, and in accordance with any other applicable civil laws. FAR Part 103 outlines inspection requirements, certification and registration, and operating rules for recreational flight. The following sub-sections of Part 103 are pertinent to soaring activities above the project site.

§ 103.9 Hazardous operations.

(a) No person may operate any ultralight vehicle in a manner that creates a hazard to other persons or property.

(b) No person may allow an object to be dropped from an ultralight vehicle if such action creates a hazard to other persons or property.

§ 103.15 Operations over congested areas.

No person may operate an ultralight vehicle over any congested area of a city, town, or settlement, or over any open air assembly of persons.

3.11.2.2 State

State Water Resources Control Board California Ocean Plan

The State Water Resources Control Board (SWRCB) has the responsibility for regulating and enforcing standard related to surface waters throughout California, including ocean waters within the 3-mile state limit. SWRCB adopted the most recent California Ocean Plan, the state's water quality control plan for California ocean waters, in October 2012. The purpose of the California Ocean Plan is to protect the quality of the ocean water for use and enjoyment by the people of the state by requiring control of the discharge of waste to ocean waters. The California Ocean Plan identifies both water contact and non-contact recreation as a beneficial use for all ocean waters of the state. As a result, it established water quality objectives for bacteria for contact recreation areas, including coastal waters adjacent to public beaches such as Carpinteria State Beach and Rincon Beach County Park. Bacterial standards for water contact apply to a zone that extends 1,000 feet from the shoreline or the 30-foot depth contour.

3.11.2.3 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan

The Open Space, Recreation, and Conservation Element of the City of Carpinteria General Plan/Local Coastal Land Use Plan provides objectives and policies related to parks and recreation needs of the community, including the following (City of Carpinteria 2003):

Objective OSC-14 Provide for adequate park and recreation facilities to meet the needs of the community and visitors.

OSC-14a Increase coastal and recreational access for all segments of the population, including the disabled and elderly, while protecting natural resources, particularly environmentally sensitive habitat areas.

OSC-14b Provide for passive recreation uses of natural open space areas, such as along creeks and the Bluffs 1 areas, where such uses would not damage the resources being protected.

OSC-14c Increase opportunities for ocean recreation programs including: kayaking, sailing, snorkeling, and scuba diving through the city Parks and Recreation Department, and by encouraging private development of these activities.

OSC-14d In a zone extending approximately 250 feet inland from the mean high tide line, priority shall be given to coastal dependent and related recreational activities and support facilities. However, camping facilities should be set back from the beach and bluffs and near-shore areas reserved for day use activities. Recreational activities that are not coastal dependent may be located within this 250-foot zone if the less desirable coastal dependent support facilities (parking, restrooms, etc.) are located inland. In no case shall facilities, except for required structures (i.e. lifeguard towers, volleyball nets, etc.) be located directly on the sandy beach.

OSC-14e Recreational uses on ocean front land, both public and private, that do not require extensive alteration of the natural environment shall have priority over uses requiring substantial alteration.

OSC-14f No unrelated development shall be permitted in publicly owned recreational areas except pipelines to serve coastal dependent industrial uses when no alternative route is feasible.

OSC-14g In implementing all proposals made in the General Plan/Land Use Plan for expanding opportunities for coastal access and recreation, utilize purchase in fee (simple) only after all other less costly alternatives have been studied and rejected as infeasible. Other alternatives may include: purchase of easements, recreation preserve contracts, and mandatory dedication in connection with development.

OSC-14h Support habitat preservation by establishing habitat preserves and open space for passive and active recreation by developing programs including, but not limited to: transfer of development rights; conservation easements; land acquisition grants; partnership agreements between private developers, the City, school districts, State Park, and the National Forest; overlay performance zoning; development impact fees for recreational resources and services; and use fees and fines.

Santa Barbara County Comprehensive Plan Coastal Land Use Plan

The County of Santa Barbara's Coastal Land Use Plan, which addresses land use in the coastal zone (including the project site and surrounding properties), emphasizes access to the County's beaches, among other planning and land use policies. Section 3.7, Coastal Access and Recreation, of the Coastal Land Use Plan includes policies aimed at protecting the public's right to access the beach and enjoy recreational opportunities at and along the shoreline. Policies specifically applicable to the project area are listed below (County of Santa Barbara 2019):

Policy 7-5: For areas controlled by Federal, State, County, or District agencies, in a zone extending approximately 250 feet inland from the mean high tide line, priority shall be given to coastal dependent and related recreational activities and support facilities. However, camping facilities should be set back from the beach and bluffs and nearshore areas reserved for day use activities. Recreational activities that are not coastal dependent may be located within this 250-foot zone if the less desirable coastal dependent support facilities (parking, restrooms, etc.) are located inland. In no case shall facilities, except for required structures (i.e., lifeguard towers, volleyball nets, etc.), be located directly on the dry sandy beach.

Policy 7-6 Recreational uses on oceanfront lands, both public and private, that do not require extensive alteration of the natural environment (i.e., tent campgrounds) shall have priority over uses requiring substantial alteration (i.e., recreational vehicle campgrounds).

Policy 7-8 Increased opportunities for beach access shall be provided in the Carpinteria planning area.

Policy 7-25 Easements for trails shall be required as a condition of project approval for that portion of the trail crossing the parcel upon which the project is proposed.

Policy 7-26 All proposed trails for the coastal zone shall be incorporated into the County's Master Plans for hiking, biking, and equestrian trails.

Policy 7-32 When reviewing a Coastal Development Permit(s) associated with the Highway 101: Carpinteria to Santa Barbara project and other highway improvement projects to the South Coast Highway 101, the County of Santa Barbara shall require coastal access improvements in addition to those required by Policy 7-31 within the corridor with the goals of providing alternative transportation

modes and establishing connectivity of the California Coastal Trail. Projects shall be designed to eliminate gaps for non-motorized travel and enhance coastal access, and shall be completed and open to the public no later than the completion of the adjacent phase of construction for the Highway 101: Carpinteria to Santa Barbara project.

Policy 7-33: To encourage walking and biking as alternatives to travel by automobile, the County shall strongly encourage development of new pedestrian and/or bicycle-friendly paths along the highway corridor. Improvements to Highway 101 shall not remove existing bikeways or pedestrian paths or preclude the development of proposed bikeways or pedestrian paths that are identified in the County's Comprehensive Plan, Coastal Land Use Plan and community plans, without providing comparable or better replacement facilities

Santa Barbara County Comprehensive Plan Open Space Element

The Open Space Element (Santa Barbara County 2009) is intended to manage and preserve land area in the County that is not suitable for urban development. Broadly there are four criteria or classifications that are employed in designating land that should remain as open or undeveloped. One of the criteria is Open Space for Outdoor Recreation. The Open Space Element indicates that the importance of open spaces for parks and recreation and recreation trails can hardly be overstated. The portion of the trail in Santa Barbara County has been designated as open space – recreation.

3.11.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to recreation are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to recreation would occur if the project would:

a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.
b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.
c) Result in cumulatively considerable recreation impacts.

3.11.4 Impact Analysis

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

The proposed project includes a shared-use path for walking and biking. The proposed trail would fill in an existing segment of the California Coastal Trail between the Carpinteria Bluffs Nature Preserve, which includes several miles of interconnected coastal bluff open space trails, and Rincon Beach County Park with 1 mile of the trail along the bluff. As the Rincon segment will expand the Carpinteria Coastal Trail System and would connect the City of Carpinteria with Rincon Beach County Park and points east and west along the Pacific Coast Bikeway and California Coastal Trail, it would provide additional recreation and access opportunities along the

Santa Barbara County and Ventura County coastline. The proposed trail also would serve to fill in missing segments in the California Missions Trail and the Juan Bautista de Anza National Historic Trail. The project would provide a safe, direct and scenic coastal pedestrian and bike trail link to Ventura County paralleling U.S. Highway 101 and would formalize one railroad overcrossing along this segment, providing for safe access to the coast.

Although the air space above the proposed trail is not a public recreational facility for the purposes of the CEQA Guidelines, the proposed trail also is not expected to significantly impair the ability of paragliders and hang-gliders. Members of the paragliding and hang-gliding community have expressed concern that the proposed regrading of slopes along the trail alignment could adversely impact wind uplift conditions, such that paragliding and hang-gliding opportunities in the air space above the property could be eliminated, or substantially reduced.

The portion of the bluff face that would be regraded for the proposed trail was previously altered to create a bench for the UPRR alignment, and this steep manufactured slope is not considered to be stable in the long term with or without the project (the railroad was previously re-aligned away from this slope). Reducing the steepness of the slope face (making it less vertical) is necessary to avoid it collapsing over time and ensuring the longevity of the proposed new trail. Comments from the soaring community indicate a belief the proposed lessening of the bluff face slope angle could reduce or eliminate wind uplift patterns along the re-graded bluff slope area.

In order to evaluate the change in wind uplift patterns above the bluff face from the proposed regrading for the project, Dudek commissioned an Airflow Analysis for the Proposed Regrading of the Rincon Bluffs study (Airflow Study) by an expert in fluid dynamics; the Airflow Study is included as Appendix I of this Environmental Impact Report. Several different approaches were used, based upon published literature including wind tunnel experiments and direct field measurements of the amplification effects of a slope or vertical face on horizontal wind vectors perpendicular to the slope face. In the published literature reviewed for this Airflow Study, certain investigators compared the average slope angle of the entire slope or bluff face to determine the wind amplification effect, while others compared the angle of just the upper portion of the slope. The analysis of the effects of the proposed regrading of the bluff face for the project concluded that the proposed regrading could reduce the vertical airflow velocity by 10% to 30% relative to current conditions; for altitudes relevant to soaring activities, the reduction is expected to be closer to 30% (Appendix I). Based on available experimental results, the introduction of an upper bench above the trail is expected to provide a small increase in turbulence (on the order of 5%) at an altitude of 30 feet above the front of the bluffs, becoming negligible by an altitude of approximately 75 feet (Appendix I).

Published records of wind speeds favorable to paragliding and hang-gliding above the bluffs along the trail alignment do not exist. However, the Torrey Pines Gliderport is a dedicated soaring facility adjacent to the ocean bluffs in San Diego County, that exhibit similar characteristics to the bluffs along the Rincon Trail alignment. At Torrey Pines, about 7-15 mph of wind coming from the west (perpendicular to the bluffs) is generally needed for paragliding tandems; hang gliding tandems generally need 10-18 mph, also from the west (Torrey Pines Gliderport 2021). This evidences a wind regime that is successful in supporting soaring operations with an approximately 50% range of wind speeds (lowest viable wind speed representing 50% of the top speed). Consequently, the maximum predicted reduction in vertical wind velocity (30%) caused by the proposed regrading of bluffs along the trail segment south of the UPRR alignment should not eliminate favorable wind uplift patterns above the bluff face for soaring activities. The existing 20% of the upper portion of wind speeds successful for soaring should continue to provide acceptable uplift conditions; thus the proposed trail alignment would not cause paragliders and hang-gliders to use other air space, such that substantial physical deterioration of those facilities would occur or be accelerated. The upper end of the wind speed regime considered acceptable for soaring activities also may be extended somewhat by reduced updraft

velocities, which may create additional opportunities for soaring activities during conditions with high wind velocities. In addition, the bluff west of where the proposed trail would cross the UPRR alignment would not be altered in any way by the proposed trail. Therefore, while the proposed regrading of the ocean bluffs will cause some modification of vertical wind velocities supporting soaring activities, it is unknown what the net effect will be on the number of days annually in which the wind conditions within the project alignment are favorable for soaring. Given the uncertainty above and the Airflow Study analysis that the maximum predicted reduction in vertical wind velocity will be 30%, the proposed project would have a **less than significant impact on recreational resources**.

Also, it must be noted that CEQA does not require analyses of "social and economic changes" alone. (See Cal. Code Regs., tit 23, § 15131, subd. (a).) Social and economic impacts, such as a decrease in usability of air space for hang gliders and paragliders, are analyzed as an indirect impact only if it leads to a significant direct physical impact to the environment, such as heavy traffic in another area that would cause an environmental impact. The Airflow Study demonstrates that any potential adverse impacts on the usability of air space above the proposed trail alignment are unlikely to cause significant physical impacts on other recreation facilities from redirected paragliding and parasailing recreation. (See, e.g. *Chico Advocates for a Responsible Economy v. City of Chico* (2019) 40 Cal.App.5th 839 (reasoning that loss of convenience is merely an example of a social problem, and without an accompanying physical change to the environment, CEQA does not require its analysis).

The use of air space above the trail alignment by paragliders and hang gliders has not been formalized in recreation plans adopted by the City of Carpinteria or County of Santa Barbara, whereas a multi-use trail through this area has been proposed for decades to connect to the coastal trail system in both Santa Barbara and Ventura counties. While adverse impacts on the usability of airspace above the proposed trail alignment as a result of the proposed regrading to construct the trail may occur and cause paragliders and hang-gliders to soar at other locations, the benefits delivered recreationally by a multi-use trail accessible for the entire population of the Central Coast would more than balance out a reduction in the frequency of recreational opportunities associated with soaring activities above the bluffs within the project alignment. Therefore, overall and in balance, the proposed project would have **less than significant impacts upon recreation resources**.

b) Would the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

The project consists of a recreational facility: a multi-use trail to accommodate pedestrians and cyclists, and which would close an important gap in the regional coastal trail system. As proposed, construction of the proposed trail would involve regrading of existing terrain within the trail alignment. The proposed project addresses potential adverse physical effects on the environment associated with this "*construction or expansion of recreational facilities*" through appropriate mitigation measures in the areas of aesthetics, biological resources, cultural resources, geology and soils, hazardous materials, hydrology, noise, and tribal cultural resources, such that the project would not create a residually significant adverse physical effect on the environment for the purposes of CEQA. Further, the Airflow Study identifies a reduction of 10-30% of vertical airflow velocities, which is not anticipated to generate an adverse physical effect on the environment or on local recreational soaring opportunities. Therefore, the proposed trail would have **less than a significant impact.**

c) Would the project result in cumulatively considerable recreation impacts?

Cumulative development throughout the Carpinteria Valley would incrementally contribute to recreation impacts. However, the proposed project would result in a beneficial impact to recreational resources and therefore, would not have a considerable contribution to cumulative impacts on recreation resources.

3.11.5 Mitigation

As discussed above, the proposed project would result in less than significant impacts on recreation resources, and therefore mitigation would be neither required nor recommended.

3.11.6 Level of Significance After Mitigation

As discussed above, the proposed project would result in less than significant impacts on recreation resources without mitigation.

3.12 Transportation

This section describes the transportation conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project.

3.12.1 Existing Conditions

The proposed Carpinteria Rincon Trail would extend from the eastern end of Carpinteria Avenue to Rincon Beach County Park along abandoned roadways or old terraced road and rail cuts. A small unsanctioned trail exists in some areas of the proposed trail, including the portion of the proposed trail from the railroad crossing to the Rincon Beach County Park parking lot. At both ends of the trail are pre-existing parking areas; Rincon Beach County Park has a paved lot and at Carpinteria Avenue there is an existing dirt lot used as an informal parking area. Neither of these parking areas are proposed to be modified under the Rincon Trail project.

The City of Carpinteria is situated along the California coast where the Santa Ynez Mountains meet the Pacific Ocean; Highway 150, US Highway 101 and Union Pacific Railroad (UPRR) all intersect in the southeastern entrance to the Carpinteria Valley near the Ventura County/Santa Barbara County line. The intensive transportation infrastructure improvements in this location included planning a bicycle route along the highway shoulder south of Bates Road, but there is no other alternative access route between the City of Carpinteria and the Ventura County line for pedestrians and cyclists. The proposed Carpinteria Rincon Trail will provide an important connection in this area and will link the two regions of Ventura County and Santa Barbara County, particularly now that the Class I Bikeway along the southbound US Highway 101 shoulder is completed between Rincon State Beach Park and Mussel Shoals in Ventura County.

Access between the City of Carpinteria and Rincon Beach County Park has primarily been provided by US Highway 101, though the distance between the two destinations is less than two miles. US Highway 101 was designed, and operates, primarily to accommodate passenger vehicles, trucks, and busses; bicycle traffic is restricted to the highway shoulder that provides no safety elements such as a barrier to separate cyclists from the adjacent vehicle travel lane. Many bicyclists and pedestrians use the railroad corridor as an alternative route, as evidenced by the well-worn, unsanctioned trail that is currently present along the railroad tracks connecting Carpinteria residents and Carpinteria State Beach visitors with Rincon Beach County Park. The railroad corridor, however, presents a public access and safety concern equal to or greater than travel along the highway shoulder, and involves unsanctioned trespass on UPRR property.

With regard to vehicular access available to either end of the proposed trail segment, Carpinteria Avenue connects to the location of the western trail terminus. The US Highway 101 interchange at State Route 150 (that also connects to Carpinteria Avenue) is within 500 feet of the western trail terminus; construction workers and haul trucks would use this interchange for access to the western or northern segment of the trail. According to Caltrans (2014), all legs of the SR 150 / US Highway interchange intersections currently operate at level of service (LOS) B during the morning peak hour; all legs except the Carpinteria Avenue/SR 150 leg also operate at LOS B during the evening peak; the Carpinteria Avenue/SR 150 leg currently operates at LOS E in the evening peak hour. Bates Road provides vehicular access to the Rincon Beach County Park, the eastern end of the proposed trail terminus. Bates Road is also developed as a full interchange for US Highway 101 construction workers and haul trucks would use this interchange for access to the eastern or southern segment of the trail. According to Caltrans (2014), all legs of the Bates Road US Highway interchange intersections currently operate at level of service (LOS) A during the morning and evening peak hours.

3.12.2 Relevant Plans, Policies, and Ordinances

3.12.2.1 Federal

There are no federal regulations associated with transportation that are relevant to the proposed project.

3.12.2.2 State

There are no state regulations associated with transportation that are relevant to the proposed project.

3.12.2.3 Local

Regional Transportation Plan (RTP)

Regional transportation planning encompassing incorporated and unincorporated communities across Santa Barbara County is the responsibility of the Santa Barbara County Association of Governments (SBCAG). The most recent regional transportation plan adopted by SBCAG is *Fast Forward 2040: Regional Transportation Plan and Sustainable Communities Strategy,* or simply the RTP (SBCAG 2017). The RTP is a long-range planning document that defines the investment and implementation program in regional transportation systems over a 20-year period based on regional goals, multimodal transportation needs for people and goods, and estimates of available funding to provide a balanced approach to addressing long-term regional needs. The RTP includes a Sustainable Communities Strategy, as required by SB 375, which sets forth a forecasted development pattern for the region and is integrated with the transportation network and other transportation measures and policies to reduce GHG emissions from passenger vehicles and light trucks to achieve the GHG reduction targets set by the California Air Resources Board (CARB). The goals and objectives of the RTP include:

- Environment: Foster patterns of growth, development, and transportation that protect natural resources and lead to a healthy environment.
  - Reduce GHG emissions in compliance with CARB Regional Targets
  - Reduce criteria pollutant emissions
- Mobility and System Reliability: Optimize the transportation system to improve accessibility to jobs, schools, and services, allow the unimpeded movement of people and goods, and ensure the reliability of travel by all modes.
  - Reduce travel times for all modes
  - Reduce congestion — Work cooperatively with schools and school districts to reduce congestion surrounding schools
- Equity: Ensure that the transportation and housing needs of all socio-economic groups are adequately served.
- Health and Safety: Improve public health and ensure the safety of the regional transportation system.
  - Reduce the frequency and severity of collisions on the transportation network
  - Increase public outreach and education
- A Prosperous Economy: Achieve economically efficient transportation patterns and promote regional prosperity and economic growth.
  - Reduce congestion
  - Optimize network performance to reduce time lost to commuting

Carpinteria General Plan/Local Coastal Land Use Plan

The Circulation Element of the General Plan/Local Coastal Land Use Plan includes goals, objectives, and policies related to providing efficient and comprehensive means for the delivery of goods, and the movement of people throughout the community, including provisions to accommodate modes of transportation beyond simply passenger vehicles and freight trucks. Objectives and policies regarding alternative modes of transportation and facilities to support pedestrian and cyclist activities are particularly relevant to the proposed project and include (City of Carpinteria 2003):

Objective C-6 Provide adequate safe railroad crossings and to effectuate community design of buffers that will attenuate rail-related noise.

C-6a Seek funding sources for grade-separated crossings of the rail line to resolve conflicts with urban linkages, where such structures are considered feasible.

C-6c Encourage development of available railroad rights-of-way for alternative transportation, bicycle, recreation, trail, parking related, and other appropriate uses.

C-6d Put programs for developing crossing improvements with the State Public Utilities Commission and railroad operators into effect.

Objective C-7 Build demand for alternative transportation use by increasing ease, effectiveness, and social acceptability, and through foresighted planning.

C-7c Provide safe mobility for the physically handicapped through the design of street improvements and public facilities.

Objective C-8 Support and develop safe, direct and well-maintained bicycle and pedestrian systems and recreational boating facilities that serve all segments of the public

C-8a Integrate the development of bicycle routes and pedestrian pathways in additional areas of the city, and encourage the utilization of such routes for commuting as well as recreational purposes.

C-8c Provide or require safe and adequate bicycle parking at transportation centers, public parks, recreation areas and other nonresidential locations.

C-8d Encourage integration of the city's bicycle routes with state and countywide programs.

C-8e Encourage educational programs on bicycle safety, and complement such programs through bicycle law enforcement.

C-8f Encourage pedestrian movement by providing pedestrian facilities that are direct and convenient, particularly in the beach and downtown areas.

C-8g Consider rerouting the Pacific Coast Bikeway to another location parallel to the coastline, such as adjacent to the railroad right of way throughout the city. [5-year]

C-8h Encourage a bike trail link from Carpinteria to Summerland along the railroad right of way and a coastal link to Ventura paralleling U.S. 101.

Santa Barbara County Coastal Land Use Plan

The Santa Barbara County Coastal Land Use Plan (County of Santa Barbara 2019) includes goals, objectives, and policies related to ensuring adequate access to the beach for all members of the public. Policies specifically related to the proposed project include:

Policy 7-8 Increased opportunities for beach access shall be provided in the Carpinteria planning area.

b. Dedication of a vertical access easement and construction of a trail to the beach shall be required of any development on the easterly end of the Carpinteria bluffs.

Santa Barbara County Comprehensive Plan – Circulation Element

The Circulation Element identifies key roadway links throughout the unincorporated areas of the County, and along with the other elements, guides decisions regarding new development and provides clear traffic capacity guidelines that are intended to maintain acceptable levels of service on the County's roadways and intersections, while allowing reasonable growth within the communities of the unincorporated area (County of Santa Barbara 2009). Consistency with the County's Circulation Element requires that projects do not contribute ADTs where estimated future volume exceeds the policy capacity. If estimated future volume exceeds policy capacity, but the project contributes ADTs less than or equal to 2% of remaining capacity or 40 ADTs, whichever is greater, the project would be consistent with the *Comprehensive Plan*.

3.12.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to transportation are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to transportation would occur if the project would:

a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
d) Result in inadequate emergency access.
e) Result in cumulatively considerable transportation impacts.

Recently Adopted Vehicle Miles Travelled Threshold for CEQA Transportation Impacts

On December 28, 2018, the California Natural Resources Agency certified and adopted proposed revisions to CEQA Guidelines Section 15064.3 and Appendix G: Environmental Checklist Form, Section XVII, Transportation. Section 15064.3 includes new criteria for determining the significance of a project's transportation impacts. Specifically, Section 15064.3(a) states "vehicle miles traveled is the most appropriate measure of transportation impacts." The revisions to Appendix G Section XVII removed references to circulation, traffic levels, and LOS. The revisions also added a new threshold question (i.e., "b") that considers whether a project would conflict or be inconsistent with the VMT criteria for analyzing transportation impacts in CEQA Guidelines Section 15064.3(b).

3.12.3.1 Local Significance Thresholds

Consistent with CEQA Guidelines Section 15064.7, the County of Santa Barbara developed and adopted the following thresholds for determining the significance of a project's transportation impacts, included in the September 2020 revision to the *Environmental Thresholds and Guidelines* (Santa Barbara County 2020).

Threshold "a" – Potential Conflict with a Program, Plan, Ordinance, or Policy

The SBCAG's 2040 Regional Transportation Plan and Sustainable Communities Strategy (SBCAG, 2013) and the County's Comprehensive Plan, zoning ordinances, capital improvement programs, and other planning documents contain transportation and circulation programs, plans, ordinances, and policies. Threshold question "a" considers a project in relation to those programs, plans, ordinances, and policies that specifically address multimodal transportation, complete streets, transportation demand management (TDM), and other VMT-related topics. The County and CEQA Guidelines Section 15064.3(a) no longer consider automobile delay or congestion an environmental impact. Therefore, threshold question "a" does not apply to provisions that address LOS or similar measures of vehicular capacity or traffic congestion. A transportation impact occurs if a project conflicts with the overall purpose of an applicable transportation and circulation program, plan, ordinance, or policy, including impacts to existing transit systems and bicycle and pedestrian networks pursuant to Public Resources Code Section 21099(b)(1).

Threshold "b" – Potential Impact to VMT Threshold question

Threshold "b" establishes VMT as the metric to determine transportation impacts. The Governor's Office of Planning and Research's (OPR) "Technical Advisory on Evaluating Transportation Impacts in CEQA" (OPR Technical Advisory) (OPR, 2018) contains principals, guidelines, recommendations and mandatory criteria for analyzing a project's transportation impacts, as an implementation guide for CEQA Guidelines Section 15064.3 (Determining the Significance of Transportation Impacts). The OPR Technical advisory identifies certain types or classes of projects that are deemed to have **less than significant VMT impacts**, including the following example:

- Addition of Class I bike paths, trails, multi-use paths, or other off-road facilities that serve nonmotorized travel.

Threshold "c" – Design Features and Hazards

Threshold "c" considers whether a project would increase roadway hazards. An increase could result from existing or proposed uses or geometric design features. In part, the analysis should review these and other relevant factors and identify results that conflict with the County's Engineering Design Standards or other applicable roadway standards. For example, the analysis may consider the following criteria:

- Project requires a driveway that would not meet site distance requirements, including vehicle queueing and visibility of pedestrians and bicyclists.
- Project adds a new traffic signal or results in a major revision to an existing intersection that would not meet the County's Engineering Design Standards.
- Project adds substantial traffic to a roadway with poor design features (e.g., narrow width, roadside ditches, sharp curves, poor sight distance, inadequate pavement structure).
- Project introduces a new use and substantial traffic that would create potential safety problems on an existing road network (e.g., rural roads with use by farm equipment, livestock, horseback riding, or residential roads with heavy pedestrian or recreational use).

Threshold "d" – Emergency Access

Threshold "d" considers any changes to emergency access resulting from a project. To identify potential impacts, the analysis must review any proposed roadway design changes and determine if they would potentially impede emergency access vehicles.

3.12.4 Impact Analysis

a) Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

The Rincon Trail segment would reduce vehicle trips and encourage bicycle and pedestrian modes of transportation to access popular coastal destinations. The project would provide a safe, direct and well-maintained coastal pedestrian and bike trail link from the existing eastern terminus of Carpinteria Avenue to the Rincon Beach County Park parking lot, and would formalize one railroad crossing along this segment, providing for safe access to the coast. The northern terminus of the Class I bikeway paralleling US Highway 101 is a short distance from the Rincon Beach County Park, connected by Rincon Point Road/Bates Road. Positive benefits would include a reduction in vehicle trips from Carpinteria residents and visitors who travel between the City of Carpinteria and Rincon Beach County Park. Since no dedicated pedestrian or bicycle amenities exist currently between these two destinations, many residents employ vehicles even for short trips. The proposed project would encourage non-vehicle travel between these two locations, thus reducing vehicle trips and minimizing the impacts of vehicles in the community and parking at Rincon Beach County Park. Impacts would be **less than significant.**

b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

The proposed Carpinteria Rincon Trail meets the definition of "*multi-use paths, or other off-road facilities that serve nonmotorized travel*" as identified in OPR's "Technical Advisory on Evaluating Transportation Impacts in CEQA"(OPR 2018). According to the OPR advisory, this type of multi-use trail for non-motorized use is deemed to have **less than significant VMT impacts.**

c) Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

The proposed shared-use path is intended to provide a safe connection for cyclists and pedestrians between the existing terminus of the east end of Carpinteria Avenue and the upper Rincon Beach County Park parking lot.. In this gap area, pedestrians and cyclists currently unsanctioned use trails along the UPRR alignment, or the shoulder of US Highway 101, both of which present safety hazards. Further, the unsanctioned trails through and across the UPRR alignment require trespass on UPRR-owned property. The proposed trail would therefore reduce existing hazards for pedestrians and cyclists and provide a legal public access path across the UPRR alignment.

As currently designed, the eastern end of the Rincon Trail would terminate at the western end of the Rincon Beach County Park parking lot. At this point, cyclists and pedestrians would need to traverse through the parking lot to reach the connection with the Class I bikeway along US Highway 101 that continues toward Ventura and vice versa for those heading west from Ventura. Pedestrians and cyclists within the Rincon Point residential neighborhood and those traveling from Ventura along the Class I bikeway also would need to traverse the parking lot (in the opposite direction) to gain access to the southern end of the Rincon Trail. Cyclists making this parking lot traverse in either direction will increase pedestrian and cyclist traffic in the parking lot. Several respondents

to the NOP indicated a concern that terminating the Carpinteria Rincon Trail at the western end of the Rincon Beach County Park parking lot could create a hazard between cyclists or pedestrians and vehicles executing parking maneuvers. The City of Carpinteria requested their consulting traffic engineers to evaluate this potential for new hazards in the parking lot area. The traffic engineer concluded there would not be a conflict between cyclists and pedestrians, as this is a slow speed mixed vehicle environment currently, and cyclists, pedestrians, and parking vehicles should continue to mix safely with the new Carpinteria Rincon Trail connection (Interwest Consulting Group, 2021). Refer to Appendix J for a copy of the Interwest memorandum. Hazards associated with cyclist, pedestrian, and vehicle interactions in the Rincon Beach County Park parking lot would be a **less than significant impact.**

The County Parks Department and SBCAG have held several meetings to discuss the issue of a more direct connection between the proposed Carpinteria Rincon Trail and the Class I bikeway along US Highway 101. Because the proposed project results in a less than significant impact, such a connector trail is not required as a mitigation measure for the proposed project. However, the County Parks Department and SBCAG have planned a study to evaluate a connector trail, as a future and separate project, that would route cyclists and pedestrians to the perimeter of the Parking Lot to make connections with the adjacent bikeway and trail systems (Appendix K).

Slow moving over-size haul trucks associated with construction activity can present a hazard where lengthy portions of the haul route would involve narrow roads with sharp curves, thereby introducing a risk for motorists deciding to attempt a passing maneuver. With regard to haul truck operations during construction, fill would be accomplished with on-site cut material. Excess earth material would be exported from the site using haul trucks with an approximately 16 cubic yard capacity, transporting such earth material to the closest disposal sites. Heavy truck traffic is anticipated to be approximately 20 heavy truck trips (10 truckloads, each with a round-trip to/from the site) a day during the grading and excavation phase of the project, which has an anticipated duration of 11 – 13 months.. This averages to 2.5 trips per hour over an 8-hour workday, with 3 trips per hour a reasonable worst-case scenario. Within the northern half of the project, north of the UPRR alignment, haul trucks would access the site via the SR150 interchange from US Highway 101 northbound or southbound. For the southern half of the project, haul trucks would navigate through the Rincon Beach County Park parking lot and use the Bates Road interchange with US Highway 101. Haul truck travel on local roadways would be minimal since freeway interchanges exist within 500 feet of the construction access at either end of the trail alignment. Given the low frequency of daily haul truck trips, and the proximity of freeway interchanges for regional access, traffic hazard impacts associated with haul truck activities during construction would result in a **less than significant impact.**

It should be noted that project effects upon parking supply/resources are not considered an environmental impact under CEQA, as supported by recent case law (*Covina Residents for Responsible Development v. City of Covina* (2018) 21 Cal.App.5th 712, 724-727.). As such, if the parking demands of a project would exceed the locally available supply of parking spaces, and/or if existing parking spaces would be removed as a direct result of the project, such effects relative to parking supplies could represent an inconvenience for community members, but would not be an environmental impact. For informational purposes, the following discussion is provided regarding construction-related parking demands. Construction of the proposed project would generate construction employee vehicle trips to and from the project site. The majority of the work would involve grading, accomplished with a few pieces of heavy equipment working at a time; typically, a bull-dozer would be used for creating the new slopes, with a front-end loader and tractor moving the material to stockpiles and loading haul trucks. The typical number of construction workers on site for grading operations would be approximately five (5). The southerly shoulder of Carpinteria Avenue from the SR 150 intersection to the eastern terminus is wide enough to accommodate vehicle parking without blocking the travel lanes. The shoulder available for parking is approximately 600 feet in length, which would accommodate approximately 24 vehicles parked parallel to the road.

This parking area would easily accommodate construction worker parking during the project construction, avoiding any inconvenience that could be associated with construction-worker parking on residential streets or in the Rincon Beach County Park parking lot. Impacts would be **less than significant.**

d) Would the project result in inadequate emergency access?

The project would connect to the existing eastern terminus of Carpinteria Avenue, providing emergency vehicle access throughout the 16-foot wide concrete trail located on the north/west side of the UPRR alignment. The project would also connect to the Rincon Beach County Park, providing emergency vehicle access throughout the 16-foot wide concrete trail located on the south/east side of the UPRR alignment. The UPRR bridge may not be rated for heavy emergency response vehicles, but the ability for emergency response vehicles to reach up to either end of the bridge would functionally provide emergency access coverage for the entire trail alignment. Development of the proposed project would therefore increase emergency access to the project area. Consequently, project impacts regarding emergency access would be **less than significant.**

e) Would the project result in cumulatively considerable transportation impacts?

Cumulative development throughout the Carpinteria Valley would incrementally contribute to traffic impacts. However, the proposed project would reduce vehicle trips and encourage safe bicycle and pedestrian modes of transportation to access popular coastal destinations. Accordingly, the proposed project would not degrade the nearby intersections' levels of service by any significant level or affect roadway capacity. Therefore, the project's contribution to cumulative transportation and traffic impacts would not be considerable.

3.12.5 Mitigation

The proposed project would result in less than significant impacts to transportation. No mitigation would be required.

3.12.5 Level of Significance Prior to Mitigation

As discussed above, no significant direct or indirect impacts related to transportation would result from the proposed project.

3.13 Tribal Cultural Resources

This section describes the existing tribal cultural resources conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project.

3.13.1 Existing Conditions

A Phase 1 cultural resources investigation for the original Carpinteria Rincon Trail design was prepared by Dudek in March 2008; this study included an archaeological site records and literature search at the Central Coast Information Center and an intensive surface reconnaissance of the proposed project area. For the currently proposed trail design, Dudek performed a new Phase 1 Cultural Resources Survey of the entire alignment to document existing conditions and in order to assess impacts of the updated trail alignment on cultural resources. The updated Phase 1 Survey included an archaeological record search and walk-over survey of the trail alignment and area within earthwork limits and temporary impact areas delineated for the transportation and storage of construction equipment. As is customary for Phase 1 Cultural Resource Surveys, the document is not circulated with the associated CEQA document. The updated Dudek Phase 1 survey is on-file with the City of Carpinteria, Community Development Department, and with the County of Santa Barbara Planning & Development Department

3.3.1.1 Ethnohistoric Context

Immediately prior to the arrival of the Spanish in A.D. 1542, the people living in the Santa Barbara region collectively known today as the Chumash, consisted of a set of related ethnolinguistic groups occupying a territory that spanned from Morro Bay in the north, south to Malibu on the coast, and inland to encompass the interior South Coast Range and the northwest Transverse Range, including the Santa Ynez River Valley, the Carrizo Plain, the Cuyama Valley, and the San Emigdio Hills. The language these people spoke is considered an isolate (Goddard 1996), distinct from the languages spoken by their neighbors, the Salinan, Yokuts, Kitanemuk, Tataviam, and Tongva (Gabrielino-Fernandeño). Internally there was considerable diversity, such that not all of the regional dialects were mutually intelligible. Today, the names for these different ethnolinguistic groups come mainly from their associations with different Mission territories: the Obispeño in the north were notably distinct from a group called the Central Chumash, which consisted of the Purisimeño, Ynezeño, Barbareño, and Ventureño. Both of these groups (Obispeño and Central Chumash) spoke languages that were in turn distinct from those spoken on the northern Channel Islands, typically grouped together under the heading of Island Chumash. Even this linguistic taxonomy masks some of the historically documented internal diversity that would include regional dialectic differences such as the Emigdiano, Castec, Matilija, Mugu, and Malibu of the Central Chumash, and the Cruzeño, Roseño, and Migueleño of the Island Chumash (see Kroeber 1925; Grant 1978a, 1978b; Golla 2011). The current project area and the broader vicinity of the city of Carpinteria was occupied historically by speakers of both Barbareño and Ventureño Central Chumash, today represented by the Barbareño/Ventureño Band of Mission Indians, headquartered in Ojai.

What we know of these people comes, in part, from the rich written accounts of a variety of sources, the earliest of which are those of the Spanish explorers to the Santa Barbara Channel and mainland, namely Cabrillo in 1542 and Vizcaíno in 1602 (Wagner 1929; Brown 1967). These observations were expanded by the accounts written during early efforts to establish evangelical Missions (and therefore Royal territory) in Alta California, namely by Portolá in 1769, de Anza in 1776, and to a lesser degree, Garcés in 1776 (Coues 1900; Bolton 1927; Gamble 2008; Priestley 1937). These accounts were further expanded by the observations and managerial records of the Mission

administrators for a period of about 60 years (Geiger 1969; Geiger and Meighan 1976; Johnson 1988, 1982). After that, Euroamerican interest in Native American life made it possible for the Native views of their own history and culture to enter into the written record, primarily in this case through ethno-historic documentation of Chumash beliefs, folk tales, music, customs, and lifeways (e.g., Blackburn 1975; Hudson et al. 1981; Harrington 1942). This forms perhaps the richest body of information that we have about the Chumash; further development of this understanding continues today, incorporating contemporary Chumash identity, concerns, interpretations, research, and politics.

The written records and accounts of Chumash life reveal a variety of things that have been of paramount importance to archaeologists for many decades. This includes accounts of what people ate and how they acquired it, how they made various elements of material culture, and how they used it (e.g., Hudson and Blackburn 1983, 1979, 1985, 1986). It also includes ideas about the landscape, knowledge of the plants and animals that live in it, and of how to manage that landscape, as well as accounts of how social life was structured, and how hierarchy and power were perceived, imagined and negotiated by individuals. The ethnohistories also contain a rich account of the structure of hierarchy within Chumash life, including ideas about how money, exchange, and territory, along with the management and manipulation of those elements, fed into the structures of social power.

It is this body of knowledge that commands the lion's-share of archaeological attention, certainly since the 1980s. Of particular importance to archaeologists of the Santa Barbara Channel has been the effort to explain the evolution of the kinds of social and political complexity revealed in the rich ethno-historic records of the Chumash (C.D. King 1976; L.B. King 1969). Attention paid to how people acquired and controlled resources, and how resources from different environments (namely the Islands, the mainland coast, and the interior) were moved across different boundaries and networks, has been extremely important. This involves a detailed understanding of how goods and services were transported not only between different aspects of the Chumash cultural sphere, but also between the Chumash and the people of the Central Valley, the Sierra Nevada, the South Coast, and the Desert Interior. Considerable ethnographic detail exists about the nature of market-based exchange, the use of shell-bead money, conscious control of inflation, the role of intermediaries in between-group exchange, trading parties from distant lands, and the kinds of goods transported from different areas, all of which play a significant role in both the interpretation of the archaeological record, and the design of archaeological research. Indeed, synthetic accounts of the ethnographic record occasionally offer insights about the archaeological patterns one might expect of the Chumash interaction sphere (Gamble 2008; C.D. King 1976; Johnson 1988, 1982).

Interests in the evolution of complex society in the Chumash world have therefore played a disproportionate role in the collective efforts of archaeologists over the past many decades. Therefore, it is not surprising that the majority of archaeological research has been focused mainly on the late prehistoric record and on understanding the evolution of the many things the Europeans were able to observe or record of Chumash life. However, as with any interpretation of the past informed by ethnohistoric observation, interpreters of the Chumash and their ancestors must be cautious about the ethnographer's interpretive agency, and the historical context of it (Haley and Wilcoxon 1997, 1999; Gill, Fauvelle, and Erlandson 2019). Contemporary re-analysis of historic observations may stimulate novel insights that engender novel directions in archaeological research.

3.3.1.2 Central Coast Information Center Records Search and Survey Results

The records search indicates that five previously recorded cultural resources exist within 0.5 mile of the proposed project site. Multiple loci of CA-SBA-1, the ethnohistoric/historic Chumash village of S*huku*, surround the proposed project site with the nearest locus (A) located immediately southeast of the proposed Project area, near the mouth

of Rincon Creek. Although limited weathered shell was observed in disturbed contexts, no cultural resources were observed in situ, or within intact soils, during the intensive field survey under generally good to excellent ground surface visibility. However, the project site is not only located partially within an archaeological site (CA-SBA-1168), it is also surrounded, in every direction, by archaeological sites with the closest loci of CA-SBA-1/CA-VEN-62 located immediately adjacent to the southeastern extent of the proposed project site. Based on the presence of a portion of the proposed project site overlapping a small portion of the archaeological site CA-SBA-1168, the close proximity of multiple archaeological sites to the proposed project site, as well as the general archaeological sensitivity of the area surrounding the proposed project site, there is substantial evidence for potential unknown significant prehistoric and historic archaeological resources to exist within the project site. Technical Reports and supporting documentation are available in Confidential Cultural Appendix D. These confidential appendices are archived at the City and are only accessible to eligible individuals as defined under applicable regulations governing cultural resources confidentiality.

3.3.1.3 Native American Coordination

Sacred Lands File Search and Tribal Outreach

A search of the Native American Heritage Commission's (NAHC's) Sacred Land File was requested on May 1, 2018, and was conducted on May 23, 2018 (received on May 25, 2018) (Frank Lienert, Associate Government Program Analyst) to determine the presence of any Native American cultural resources within the proposed project site (see Confidential Appendix L). The NAHC indicated that no known Native American heritage resources are identified within the proposed project site. The NAHC identified six Native American individuals who would potentially have specific knowledge as to whether or not other cultural resources are identified within the project site that could be at-risk. Informal outreach letters (not formal AB-52 notification) were sent via email and certified mail on May 25, 2018 to six Native Americans representatives identified by the NAHC who might have knowledge of previously undocumented cultural resources within the APE. Dudek made follow-up phone calls on June 4 and 11, 2018. Three responses were received on June 4, 2018, one response was received on June 11, 2018. As of September 28, 2018, two of the Native American representatives have not responded to Dudek's multiple and varied communication efforts.

The three responses to Dudek's outreach efforts included the following individuals all belonging to the Barbareño/Ventureño Band of Mission Indians: Julie Lynn Tumamait-Stenslie, Chair (June 11, 2018 phone call initiated by Dudek); Patrick Tumamait, Chair (June 4, 2018 phone call initiated by Dudek); and Eleanor Arrellanes (June 4, 2018 phone call initiated by Dudek). Each representative expressed concern about proposed disturbances, a desire to be contacted regarding any aspect of the proposed project, as well as the need for archaeological and Native American monitoring.

Assembly Bill (AB) 52

A project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource (TCR) is a project that may have a significant effect on the environment (PRC Section 21084.2). Under AB 52, a TCR must have tangible, geographically defined properties that can be impacted by project implementation. The proposed project is subject to compliance with AB 52.

On October 25, 2019, the City of Carpinteria sent AB-52 notification letters certified mail (letters provided via email to contacts that provided their email address), to each Native American contact provided by the NAHC on May 25, 2018 and to those tribal entities that have formally requested notification from the City. The NAHC provided an

updated contact list to the City on October 29, 2019, which included five new contacts; the City sent AB-52 notification letters to the five newly identified contacts on October 28 and 29, 2019. On November 16, 2020, the City sent out email reminders for the proposed project's EIR virtual scoping meeting, and one of the recipients of that email included some tribal representatives that the City typically communicates with on overall projects within City limits. As a result of that forwarded scoping email, Patrick Tumamait of the Barbareno/Ventureno Band of Mission Indians, responded on November 17, 2020. In his response, Mr. Tumamait stated that the proposed project site is sensitive, that he has been told of a recorded site nearby and that he recommends Native American monitoring and would like to take on that role for the project. It should be noted that Mr. Tumamait is not on the City's AB 52 contact list and this correspondence between the City and Mr. Tumamait is not part of the formal AB 52 consultation process. To date, no California Native American tribes have requested consultation with the City. Therefore, government-to-government consultation initiated by the City has not resulted, to date, in the identification of a TCR within or near the Project Site. Table 3.13-1 summarizes the results of the AB 52 process for the proposed project.

Table 3.13-1. Assembly Bill 52 Native American Tribal Outreach Results

Native American Tribal Representatives	Method of Notification/ Date of Delivery	Response to City Notification Letters
Gino Altamirano, Chairperson Coastal Band of the Chumash Nation	Certified Mail: October 29, 2019	None to date
Fred Collins, Spokesperson Northern Chumash Tribal Council	Certified Mail and email: October 29, 2019	Response received via email on October 30, 2019. Spokesperson Collins stated that the Tribe is engaged with San Luis Obispo County only and that the Tribe supports local tribal recommendations. The City responded to Spokesperson Collins' email on that same day stating that the City notified the Tribe at the recommendation of the NAHC and inquired as to whether the Tribe would like to be removed from the City's AB 52 contact list. Spokesperson Collins responded via email on November 11, 2019 stating that the Tribe will respond to any project that the City does not get a comment for and if help is needed, they would like to serve as a backup Tribe.
Kenneth Kahn, Chairperson Santa Ynez Band of Chumash Indians	Certified Mail: October 29, 2019	None to date
Julio Quair, Chairperson Chumash Council of Bakersfield	Certified Mail: October 29, 2019	None to date
Mona Tucker, Chairperson yak tityu tityu yak tilhini- Northern Chumash Tribe	Certified Mail and email: October 29, 2019	Response received via email on October 29, 2019. Chairperson Mona stated that the proposed project is not within the Tribe's territory and recommended that other tribes and families ancestrally affiliated to the proposed project site location be contacted.

Table 3.13-1. Assembly Bill 52 Native American Tribal Outreach Results

Native American Tribal Representatives	Method of Notification/ Date of Delivery	Response to City Notification Letters
Julie Lynn Tumamait-Stenslie, Chair Barbareno/Ventureno Band of Mission Indians	Certified Mail: October 25; Email October 28, 2019; Second Certified Mail: October 29, 2019	Response to City's notification email sent October 28, 2019 was received from Ms. Tumamait-Stenslie via email that same day acknowledging receipt of notification. The City has not received any additional information/responses from Ms. Tumamait-Stenslie as a result of the AB 52 notification letters or email.
Mark Vigil, Chief San Luis Obispo County Chumash Council	Certified Mail: October 29, 2019; no email address provided.	None to date

3.13.2 Relevant Plans, Policies, and Ordinances

3.13.2.1 State

The California Register of Historical Resources (CRHR) (Public Resources Code Section 5020 et seq.)

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (PRC Section 5020.1(j)). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code section 5024.1(a)). A resource is eligible for listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following Nation Register of Historic Places (NRHP) criteria (PRC Section 5024.1(c)):

- Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- Associated with the lives of persons important in our past.
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- Has yielded, or may be likely to yield, information important in prehistory or history.

Resources less than 50 years old are not considered for listing in the CRHR, but may be considered if it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (see 14 CCR, Section 4852(d)(2)).

> The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed

on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

California Environmental Quality Act

The following California Environmental Quality Act (CEQA) statutes (PRC Section 21000 et seq.) and CEQA Guidelines (14 CCR 15000 et seq.) are of relevance to the analysis of archaeological, historic, and tribal cultural resources (TCRs):

- PRC Section 21083.2(g) defines "unique archaeological resource."
- PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a) defines "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource"; it also defines the circumstances when a project would materially impair the significance of a historical resource.
- PRC Section 21074(a) defines "tribal cultural resources."
- PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- PRC Sections 21083.2(b) and 21083.2(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures. Preservation in place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; 14 CCR 15064.5(b)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (14 CCR 15064.5(b)(1); PRC Section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project does any of the following (14 CCR 15064.5(b)(2)):

(1) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or

(2) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

(3) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance would be materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC Sections 21083.2(a)–(c)).

Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria (PRC Section 21083.2(g)):

(1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
(2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.
(3) Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Impacts on non-unique archaeological resources are generally not considered a significant environmental impact (PRC Section 21083.2(a); 14 CCR 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as a TCR (PRC Sections 21074(c) and 21083.2(h)), further consideration of significant impacts is required.

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. These procedures are detailed in PRC Section 5097.98.

Assembly Bill 52

Assembly Bill (AB) 52 formalizes the consultation process between lead agencies and tribal representatives, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with a project area. This includes tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report.

Tribal Cultural Resources (TCRs)

Section 4 of AB 52 adds Sections 21074 (a) and (b) to the PRC, addressing TCRs and cultural landscapes. Section 21074 (a) defines a "tribal cultural resource" as one of the following:

1. Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
   a. Included or determined to be eligible for inclusion in the California Register of Historical Resources.
   b. Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.
2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1.

> In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a tribal cultural resource has a significant effect on the environment." Effects on TCRs should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to TCRs, the consultation shall include those topics (PRC Section 21080.3.2[a]). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted (PRC Section 21082.3[a]).

Native American Historic Cultural Sites

The Native American Historic Resources Protection Act (PRC Section 5097, et seq.) addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NAHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy an Indian historic or cultural site that is listed or may be eligible for listing in the CRHR.

California Native American Graves Protection and Repatriation Act

The California Native American Graves Protection and Repatriation Act (California Repatriation Act), enacted in 2001, requires all state agencies and museums that receive state funding and that have possession or control over collections of human remains or cultural items, as defined, to complete an inventory and summary of these remains and items on or before January 1, 2003, with certain exceptions. The California Repatriation Act also provides a process for the identification and repatriation of these items to the appropriate tribes.

California Health and Safety Code

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in PRC Section 5097.98.

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. Health and Safety Code Section 7050.5b requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County Coroner has examined the remains. PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Health and Safety Code Section 7050.5c). The NAHC will notify the Most Likely Descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. The inspection must be completed within 48 hours of notification of the MLD by the NAHC. The MLD may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

3.13.2.2 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan

The City's General Plan/Local Coastal Land Use Plan includes the following objectives and policies relevant to the proposed project and cultural resources:

- OSC-16 Preserve Carpinteria's Cultural Resources

Implementation Policies

74. Explore all available measures, including purchase, tax relief, purchase of development rights, etc. to avoid development on important archaeological sites. Where these measures are not feasible and development will adversely affect identified archaeological or paleontological resources, require adequate mitigation.

75. Prohibit activities, other than development, which could damage or destroy archaeological sites, including off-road vehicle use and unauthorized collecting of artifacts.

76. Review all proposals for development in or adjacent to cultural resource areas for their potential to impact the resource. Give special consideration to development of facilities that enhance the cooperation, enjoyment or maintenance of these areas.

77. Prior to the city granting a development permit, all archaeological sites (or areas near known archeological sites that have been determined though Phase 1 investigation to potentially include cultural or paleontological resources) must undergo a subsurface test to determine the integrity and significance of the site. Through the project environmental review process, the disposition and/or preservation of any archaeological sites deemed to have significance as a result of the subsurface testing shall be determined. Preservation of cultural/paleontological resource sites through avoidance shall be preferred, however, other methods of disposition may be approved through the environmental review process as identified in the city's Guidelines for the Implementation of CEQA.

78. A qualified archaeologist and Native American observer (acceptable to the city) shall be retained to monitor grading activities on identified archeological sites and in the vicinity of identified archaeological resources. If cultural artifacts or similar material of potential cultural or paleontological importance, are uncovered during grading or other excavation the following shall occur:

    a. The monitor or archaeologist shall halt the grading or excavation and notify the City.
    b. A qualified archaeologist shall prepare a report assessing the significance of the find and recommending any actions to be taken by the applicant(s) prior to the city granting permission for grading to resume.
    c. The removal of cultural artifacts or other materials shall only occur after preparation of the report and in conformance with the recommendations of the report as approved by the City.

Santa Barbara County Article II Coastal Zoning Ordinance

Pursuant to PRC Section 30500 of the California Coastal Act of 1976, Santa Barbara County was required to prepare a Local Coastal Plan (LCP) for portions of the unincorporated areas of Santa Barbara County within the coastal zone. Sections of the Santa Barbara County Article II Zoning Ordinance that may be relevant to the proposed project include standards for archaeological resources (Section 35-65).

Section 35-65. Archaeology

1. When developments are proposed for lots where archaeological or other cultural sites are located, project design shall be required which avoids impacts to such cultural sites if possible.
2. When sufficient planning flexibility does not permit avoiding construction on archaeological or other types of cultural sites, adequate mitigation shall be required. Mitigation shall be designed in accord with guidelines of the State Office of Historic Preservation and the State of California Native American Heritage Commission.
3. Native Americans shall be consulted when development proposals are submitted which impact significant archaeological or cultural sites.

Santa Barbara County Coastal Land Use Plan

The Santa Barbara County Coastal Land Use Plan was partially certified by the Coastal Commission on March 17, 1981 and is the Local Coastal Program for unincorporated Santa Barbara County. It details the rules and regulations of land use within Santa Barbara County's coastal areas. The following policies would apply to the proposed project.

- Policy 10-1: All available measures, including purchase, tax relief, purchase of development rights, etc., shall be explored to avoid development on significant historic, prehistoric, archaeological, and other classes of cultural sites.
- Policy 10-2: When developments are proposed for parcels where archaeological or other cultural sites are located, Project design shall be required which avoids impacts to such cultural sites if possible.
- Policy 10-3: When sufficient planning flexibility does not permit avoiding construction on archaeological or other types of cultural sites, adequate mitigation shall be required. Mitigation shall be designed in accord with guidelines of the State Office of Historic Preservation and the State of California Native American Heritage Commission.

3.13.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to tribal cultural resources are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to tribal cultural resources would occur if the project would:

a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
   i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

b) Result in cumulatively considerable impacts to tribal cultural resources.

3.13.4 Impact Analysis

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Based on the CHRIS and NAHC SLF records searches, including background research as summarized above, no previously recorded archaeological resources of Native American origin or TCRs listed in the CRHR or a local register or in any other of the records reviewed were identified within the Project Site. Further, no TCRs have been identified by California Native American tribes as part of the City's AB 52 notification process, and no California Native American tribes requested consultation with the City. However, there is still a potential for unknown subsurface TCRs to be impacted by the project, which could result in a potentially significant impact. Therefore, protocols for the inadvertent discovery of TCRs is included as **MM-TCR-1**. In coordination with the implementation of **MM-CR-1** through **MM-CR-4**, **MM-TCR-1** will reduce the potentially significant impact to unknown TCRs to a **less than significant level**.

b) Would the project result in cumulatively considerable impacts to tribal cultural resources?

Potentially significant project-specific impacts to tribal cultural resources would be reduced to less than significant with implementation of **MM-CR-1** through **MM-CR-4** and **MM-TCR-1**, avoiding the potential for the proposed project to contribute to cumulative impacts to cultural resources. The project would, therefore, result in a less than cumulatively considerable impact to cultural resources.

3.13.5 Mitigation

The potential exists for significant tribal cultural resources impacts. The project would require the implementation of **MM-CUL-1** through **MM-CUL-4** and **MM-TCR-1** to reduce such impacts.

MM-CR-1 through **MM-CR-4** (see Section 3.4, Cultural Resources)

MM-TCR-1 **Initial ground disturbing activities shall be monitored by a Native American observer in accordance with the following specifications:**

Temporary Impact Areas (equipment staging and materials storage outside trail alignment) - a Native American observer, ancestrally affiliated with the area, shall monitor transport and placement activities until such time that it is reasonable to ascertain that no additional prehistoric archaeological/cultural resources are located within areas of temporary disturbance of the proposed project site.

Permanent Impact Areas not including bridge piling installation (all areas of the trail alignment excepting the bridge approach areas on both sides of the UPRR alignment) – a Native American observer, ancestrally affiliated with the area, shall monitor project implementation during the initial grading and excavation activities until such time as sufficient subsurface soil has been uncovered/excavated to ascertain that no additional prehistoric archaeological/cultural resources are located on the proposed project improvement area.

Bridge piling installation – a Native American observer, ancestrally affiliated with the area, shall monitor the installation of bridge pilings within intact soils and/or any soils deeper than 10 feet below current ground surface to ascertain that no additional prehistoric archaeological/cultural resources are located on the proposed project improvement area.

The monitor/observer shall immediately inform equipment operators in the event archaeological resources are encountered, and shall be empowered to immediately halt construction activity in the area of the discovery until assessment can be completed, and materials recovered as appropriate (refer to CR-2 for additional detail). Monitor reports shall be provided to the City of Carpinteria/County of Santa Barbara on a monthly basis during construction, with a final monitoring report produced at the conclusion of construction activities and provided to the City and County.

Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria shall contract with a Native American observer, ancestrally affiliated with the area, to monitor initial ground disturbance activities in accordance with the above criteria. ***Monitoring***: City of Carpinteria/County of Santa Barbara staff shall ensure the Native American observer, ancestrally affiliated with the area, provide monitoring of initial ground disturbance activities in accordance with the above criteria through receipt of field documentation describing each day of monitoring, construction activity occurring during the monitoring, and observed soil profile conditions related to the potential for presence of archaeological resources.

3.13.6 Level of Significance After Mitigation

Potential impacts to tribal cultural resources would be reduced to less than significant with implementation of **MM-CR-1** through **MM-CR-4** and **MM-TCR-1**.

3.14 Utilities and Services Systems

This section describes the existing utilities and service systems of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project.

3.14.1 Existing Conditions

Water Service

Water is supplied by the Carpinteria Valley Water District (CVWD) through distribution line and storage facilities controlled by CVWD. CVWD connected to state water in November 1997 (City of Carpinteria 2003). There are no water lines adjacent to or underlying the project area. Domestic (potable) water service is currently provided at Rincon Beach County Park by CVWD.

Wastewater Service

Wastewater collection and treatment services in the Carpinteria Valley are managed by the Carpinteria Sanitary District (CSD). This community-wide service agency has the obligation of operating and maintaining this system for the transmission, treatment and disposal of sewage generated within this area. The CSD is also responsible for providing treatment to the level necessary to meet various discharge requirements set by the Regional Water Quality Control Board and other state and federal agencies. Currently, service is provided to areas both within and outside the limits of the City of Carpinteria. Sewage generated in this area is conveyed through district lines to the treatment facility located between Olive and Oak Avenues, south of 6th Street and adjacent to the UPRR (City of Carpinteria 2003). Wastewater collection service via CSD is currently provided at Rincon Beach County Park.

Solid Waste Collection and Disposal

Solid waste produced in the City of Carpinteria is collected by E.J. Harrison and Sons Inc., located in Ventura. E.J. Harrison and Sons Inc. provides solid waste collection and disposal for all residential, commercial, and industrial areas in the City. Once collected, the solid waste is transported to the Gold Coast Material Recovery Facility and the residual is ultimately deposited in the Toland landfill (City of Carpinteria 2003). Waste in the south coast of the County of Santa Barbara, which includes Rincon Beach County Park, is collected and hauled by MarBorg Industries (Santa Barbara County Resource Recovery & Waste Management Division 2021).

3.14.2 Relevant Plans, Policies, and Ordinances

3.14.2.1 Federal

Integrated Waste Management Act of 1989 (AB 341)

The Integrated Waste Management Act of 1989 requires each city, county, and regional agency to develop a source reduction and recycling element of an integrated waste management plan that includes source reduction, recycling, and composting components. A minimum of a 50% diversion rate of all solid waste from landfill disposal or transformation by January 1, 2000 was required and met. The current policy goal of the state is no less than 75% of solid waste generated be source reduced, recycled, or composted by the year 2020 to divert as much waste as possible from entering landfills.

3.14.2.2 State

Water Services

Urban Water Management Planning Act

In 1983, the Legislature enacted the Urban Water Management Planning Act (UWMP Act; California Water Code, Sections 10610–10656), which requires specified urban water suppliers within the state to prepare an Urban Water Management Plan (UWMP) and update it every 5 years. State and local agencies and the public frequently use UWMPs to determine if agencies are planning adequately to reliably meet water demands in various service areas. As such, UWMPs serve as an important element in documenting water supply availability and reliability for purposes of compliance with state laws, Senate Bills 610 and 221, which link water supply sufficiency to large land-use development project approvals. Urban water suppliers also must prepare UWMPs, pursuant to the UWMP Act, to be eligible for state funding and drought assistance.

The UWMP provides information on water usage, water supply sources, and water reliability planning within a specified water agency service area. It also may provide implementation schedules to meet projected demands over the planning horizon; a description of opportunities for new development of desalinated water; groundwater information (where groundwater is identified as an existing or planned water source); description of water quality over the planning horizon; and identification of water management tools that maximize local resources and minimize imported water supplies. Additionally, the UWMP evaluates the reliability of water supplies within the specified service area. This includes a water supply reliability assessment, water shortage contingency plan, and development of a plan in case of an interruption of water supplies.

Senate Bills 610 and 221

On January 1, 2002, Senate Bill 610 took effect. Senate Bill 610, which was codified in the Water Code beginning with Section 10910, requires the preparation of a water supply assessment for projects within cities and counties that propose to construct 500 or more residential units or the equivalent. Senate Bill 610 stipulates that when environmental review of certain development projects is required, the water agency that is to serve the development must complete the water supply assessment to evaluate water supplies that are or will be available during normal, single-dry, and multiple-dry years during a 20-year projection to meet existing and planned future demands, including the demand associated with a proposed project.

Senate Bill 221, enacted in 2001 and codified in the Water Code, requires a city, county, or local agency to include a condition to any tentative subdivision map that a sufficient water supply shall be available to serve the subdivision. The term “sufficient water supply” is defined as the total water supplies available during normal, single-dry, and multiple-dry years within a 20-year projection that would meet the proposed subdivision project’s projected water demand, in addition to existing and planned future water uses, including agricultural and industrial uses, within the specified service area. Senate Bill 221 further requires any verification of “projected” water supplies to be based on entitlement contracts, capital outlay programs and regulatory permits and approvals.

Executive Order B-29-15

In response to the ongoing drought in California, Executive Order (EO) B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives have since become permanent water-efficiency

standards and requirements. The EO includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources has modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increases the requirements for landscape water use efficiency and broadens its applicability to include new development projects with smaller landscape areas.

Solid Waste

Title 14: Natural Resources – Division 7

Title 24 of the California Code of Regulations regarding Natural Resources sets minimum standards for solid waste handling and disposal, including specific regulations regarding waste tire storage and disposal, hazardous waste disposal facilities, construction and demolition and inert debris transfer/processing, construction and demolition waste and inert debris disposal, transfer/processing operations and facilities, siting and design, operation standards, record keeping, and additional operating requirements for facilities. Additional guidance and requirements for compostable materials handling operations and facilities, asbestos handling and disposal, resource conservation programs, farm and ranch solid waste cleanup and abatement, used oil recycling program, electronic waste recovery and recycling, solid waste cleanup among others are also addressed in Title 14.

Title 27: Environmental Protection – Division 2, Solid Waste

Title 27 of the California Code of Regulations regarding Environmental Protection and Solid Waste set the criteria for all waste management units, facilities, and disposal sites including regulations of the CIWMB and SWRCB. Waste classification, siting, construction standards, water quality monitoring and response programs, operating criteria, daily and immediate cover, handling and equipment, controls, gas monitoring and control, closure and post-closure standards, and financial assurances are all aspects covered in Title 27.

Assembly Bills 939 and 341: Solid Waste Reduction

The California Integrated Waste Management Act of 1989 (Assembly Bill [AB] 939) was enacted as a result of a national crisis in landfill capacity, as well as a broad acceptance of a desired approach to solid waste management of reducing, reusing, and recycling. AB 939 mandated local jurisdictions to meet waste diversion goals of 25% by 1995 and 50% by 2000, and established an integrated framework for program implementation, solid waste planning, and solid waste facility and landfill compliance. AB 939 requires cities and counties to prepare, adopt, and submit to the California Department of Resources Recycling and Recovery (Cal Recycle) a source reduction and recycling element to demonstrate how the jurisdiction will meet the diversion goals. Other elements included encouraging resource conservation and considering the effects of waste management operations. The diversion goals and program requirements are implemented through a disposal-based reporting system by local jurisdictions under California Integrated Waste Management Board regulatory oversight. Since the adoption of AB 939, landfill capacity is no longer considered a statewide crisis. AB 939 has achieved substantial progress in waste diversion, program implementation, solid waste planning, and protection of public health, safety, and the environment from landfills operations and solid waste facilities.

In 2011, AB 341 was passed, making a legislative declaration that it is the policy goal of the state that not less than 75% of solid waste generated be source reduced, recycled, or composted by the year 2020. AB 341 requires that local agencies adopt strategies that will enable 75% diversion of all solid waste by 2020. This bill requires all commercial businesses and public entities that generate 4 cubic yards or more of waste per week to have a recycling program in place.

AB 1826 - Mandatory Commercial Organics Recycling

In 2014, the State of California adopted AB 1826, a mandatory commercial organics recycling law that took effect in 2016. "Organic waste" means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper that is mixed in with food waste. As of January 1, 2017, businesses (including public entities) and multifamily residential dwellings of five units or more units that generate 4 cubic yards of organic waste per week are mandated to recycle their organic waste.

3.14.2.3 Local

City of Carpinteria General Plan/Local Land Use Plan

Sanitary Sewer Services. Per the City's general plan, wastewater collection and treatment services are managed by the CSD. CSD has the obligation of operating and maintaining this system for the transmission, treatment, and disposal of sewage generated within their service area. The general plan states that the District is responsible for providing treatment to the level necessary to meet requirements set by the Regional Water Quality Control Board and other state and federal agencies (City of Carpinteria 2003).

Domestic Water Service. Per the City's general plan, domestic water service in Carpinteria is subordinate to two components: supply and distribution system. Water is supplied by CVWD through distribution line and storage facilities controlled by CVWD. CVWD connected to state water in November 1997 (City of Carpinteria 2003).

The City of Carpinteria General Plan/Local Land Use Plan Public Facilities & Services Element includes various goals, objectives, and policies related to ensuring the provision of adequate essential utilities and infrastructure systems for proposed development. Policies specifically related to the proposed project include:

Objective PF-1 To ensure the provision of adequate water supplies by minimizing consumption and investigating new sources either in existing supply or outside existing sources.

Policy PF-1d The City shall reevaluate existing water facility regulations and amend said codes to require new development to utilize water-efficient devices responsive to our water source area.

Objective PF-2 Ensure adequate service systems for the transmission, treatment and disposal of sewage and wastewater generated within this area as well as the disposal of trash, green waste and recyclable material.

Objective PF-6 To ensure that new development is adequately served by utilities and does not impact existing service areas in the community.

Policy PF-6a The ultimate responsibility to ensure that the facilities (including systemwide improvements) needed to support the project are available at the time that they are needed shall be that of the sponsor or development projects.

Policy PF-6c Development projects within Carpinteria shall be required to: 1. construct and/or pay for the new on-site capital improvements that are required to support the project; 2. ensure that all new off-site capital improvements that are required by the project are available prior to certificate of occupancy; 3. be phased so as to ensure that the capital facilities that will be used by the new development are available prior to certificates of occupancy; 4. ensure that, in

the event that public services or off-site capital facilities are impacted prior to development, the level of service provided to existing development will not be further impacted by the new development; and 5. provide for the provision of public services, and shall not increase the cost of public services provided to existing development.

Santa Barbara County Coastal Land Use Plan

The Santa Barbara County Coastal Land Use Plan (County of Santa Barbara 2019) includes goals, objectives, and policies related to ensuring the provision of adequate essential utilities and infrastructure systems for proposed development, implementing regulations in the interest of the public health and safety, and providing for the general welfare of the community. Policies specifically related to the proposed project include:

Policy 2-4 Within designated urban areas, new development other than that for agricultural purposes shall be serviced by the appropriate public sewer and water district or an existing mutual water company, if such service is available.

Policy 2-5 Water-conserving devices shall be used in all new development.

Policy 2-6 Prior to issuance of a development permit, the County shall make the finding, based on information provided by environmental documents, staff analysis, and the applicant, that adequate public or private services and resources (i.e., water, sewer ads, etc.) are available to serve the proposed development. The applicant shall assume full responsibility for costs incurred in service extensions or improvements that are required as a result of the proposed project. Lack of available public or private services or resources shall be grounds for denial of the project or reduction in the density otherwise indicated in the land use plan. Where an affordable housing project is proposed pursuant to the Affordable Housing Overlay regulations, special needs housing or other affordable housing projects which include at least 50% of the total number of units for affordable housing or 30% of the total number of units affordable at the very low income level are to be served by entities that require can-and-will-serve letters, such projects shall be presumed to be consistent with the water and sewer service requirements of this policy if the project has, or is conditioned to obtain all necessary can-and-will-serve letters at the time of final map recordation, or if no map prior to issuance of land use permits.

Policy 2-3 In the furtherance of better water management, the County may require applicants to install meters on private wells and to maintain records of well extractions for use by the appropriate water district.

Policy 2-4 Within designated urban areas, new development other than that for agricultural purposes shall be serviced by the appropriate public sewer and water district or an existing mutual water company, if such service is available.

Policy 2-5 Water-conserving devices shall be used in all new development.

Policy 2-9 The existing water supply of the Carpinteria County Water District (67,541 AFY) shall be divided between the County and the City of Carpinteria on the basis of historical use; 30 percent (2,262 AFY) shall be allocated for use with the City and

70 percent shall be allocated for use within the County. The uncommitted water surplus in the Carpinteria County Water District may be increased proportionate to the amount of additional documented water such as that provided by reinjection programs and/or water reclamation and reservoir facilities which are designed to collect and reclaim wastewater and runoff from swales, creeks, or waterways which the district has the legal right to so utilize. The total uncommitted water surplus within the district shall be reevaluated on an annual basis.

Action:

The County's portion of the uncommitted water surplus shall be allocated for priority uses, including but not limited to the following:

1) Agriculture: Water shall be distributed between open field crops and greenhouses, nurseries, and cover crops on the basis of established water usage, i.e., approximately 56 percent of the agricultural water supply shall be used for open field crops and 44 percent for greenhouses, nurseries, and other cover crop production.
2) Residential development: New development shall be based on the 10 to 1 ratio (between urban development in the City of Carpinteria and residential development in the unincorporated area of the County) established by the State Coastal Commission. (For example, since 30 percent of the water surplus is currently being allocated to the City of Carpinteria for urban uses, 3 percent shall be allocated to the County for residential development within the rural neighborhoods delineated on the land use plan maps.)
3) Public recreation
4) Visitor-serving commercial: Two areas allow for this use on the land use plan map;-the eastern end of the Carpinteria bluffs and-the Carpinteria Camper Park on North Via Real west of the City.

Policy 2-10 Annexation of a rural area(s) to a sanitary district or extensions of sewer lines into rural area(s) as defined on the land use plan maps shall not be permitted unless required to prevent adverse impacts on an environmentally sensitive habitat, to protect public health, or as a logical extension of services.

3.14.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to utilities and service systems are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to utilities and service systems would occur if the project would:

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.
c) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.
d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste.
f) Result in cumulatively considerable impacts relating to utilities and service systems.

3.14.4 Impact Analysis

a) Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment, or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

The proposed project is a shared-use path that would be used primarily for bicycle and pedestrian travel. The project would therefore not create additional demands in the areas of natural gas, electricity or telecommunications facilities. The project would moderately alter the existing drainage patterns of the site, via regrading of project slopes and short-term removal of vegetation, as well as through introduction of the impervious trail surface (approximately 1 acre of new impervious surface), resulting in a potentially significant impact. Increased stormwater run-off during construction and until new vegetation is established are addressed under Section 3.8, Hydrology and Water Quality, as **Mitigation Measure (MM) WAT-1, MM-WAT-2, MM-WAT-3,** and **MM-WAT-4**. Stormwater run-off from the trail surface would be collected by a concrete v-ditch adjacent to the trail and released through a series of short storm drains with discharge along the adjacent beach. The storm drains would be installed by the project and would be the responsibility of the project sponsors to maintain. **MM-WAT-5** requires maintenance of the storm drains in perpetuity to prevent failure of such systems. Potential impacts related to stormwater system facilities would be **less than significant with mitigation.**

b) Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?

The proposed project would not require new water supply to serve the trail and its supporting facilities; minimal water would be required for landscape irrigation and maintenance purposes. Recycled water would be used for irrigation if locally available. Following restoration and during the plant establishment period, native plants would require regular irrigation during the dry season until they are established; approximately one to two years. The Carpinteria Valley Water District releases an annual report which assesses its water supply and indicates the District has excess water to meet the demands of all lands within the District's jurisdiction into the foreseeable future (CVWD 2017). A minimal amount of water would be required during construction of the proposed trail for fugitive dust control during earthwork activities. Furthermore, project construction is not anticipated to adversely affect or disrupt water service. The total amount of water required during construction and operation of the project would not impact the availability of water to the District's service area. Impacts would be **less than significant.**

c) Would the project result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

The proposed project is a shared-use path that would be used primarily for bicycle and pedestrian travel. The project would not include the use of septic systems or alternative wastewater disposal systems; therefore, the proposed project is not anticipated to generate a need for new or altered sewer system facilities. Wastewater generated by users of the proposed trail would be serviced by existing facilities at the Rincon Beach County Park. The proposed project would not adversely affect the wastewater treatment provider's ability to serve existing commitments. Potential impacts related to sewer system facilities would be **less than significant.**

d) Would the project generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

The proposed project consists of a shared-use path that would not generate a substantial amount of solid waste that would adversely affect landfill capacity or would breach national, state or local standards. Solid waste

generated by using the trail would be limited to trash and recycling materials deposited in the waste receptacles provided at the existing dirt parking lot at the west end of the trail or in Rincon Beach County Park; both waste and recycling receptacles are currently provided at Rincon Beach County Park. Construction waste generated by the project, including concrete, steel rebar, exported soils and wood for concrete forms, would be taken to an appropriate construction waste recycling facility in Santa Barbara or Ventura County, to avoid such waste from entering a landfill facility. Impacts would be **less than significant.**

e) Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

As mentioned in criteria d), the project will not generate a substantial amount of solid waste that would affect landfill capacity or breach national, state, or local standards. Potential impacts would be **less than significant.**

f) Would the project result in cumulatively considerable impacts relating to utilities and service systems?

Cumulative development throughout the Carpinteria Valley would incrementally contribute to utility and service impacts, resulting in a potentially significant impact. However, with implementation of required mitigation measures (**MM-WAT-1** through **MM-WAT-5),** utility and service system impacts of the project would be reduced to less than significant or no impacts; the project would therefore have a less than considerable contribution to potential cumulative impacts in the region.

3.14.5 Mitigation

The proposed project could have potentially significant impacts upon stormwater systems and cumulative impacts to stormwater systems, for which mitigation has been required (**MM-WAT-1** through **MM-WAT-5**). **MM-WAT-1** through **MM-WAT-5**, outlined in Section 3.8, would be implemented to reduce potential project impacts to stormwater runoff during construction and until new vegetation is established. The proposed project would result in less than significant or no impacts to utilities and service systems other than stormwater systems. All potential impacts upon utilities and services systems would be reduced to less than significant with incorporation of required mitigation measures.

3.14.6 Level of Significance After Mitigation

As discussed above, the project could have potentially significant impacts on stormwater systems. With implementation of mitigation **MM-WAT-1** through **MM-WAT-5**, impacts would be reduced to less than significant.

4 Effects Found Not to be Significant

Section 15128 of the California Environmental Quality Act (CEQA) guidelines requires that an Environmental Impact Report (EIR) briefly describe potential environmental effects that were determined not to be significant and therefore were not discussed in detail in the EIR. The environmental issues discussed in the following sections are not considered significant for the proposed Carpinteria Rincon Trail Project (project) and the reasons for these less-than-significant impact or no impact determinations are discussed herein.

The environmental issues addressed in this chapter include the following:

- Agricultural and Forestry Resources
- Energy
- Mineral Resource
- Population and Housing
- Public Services
- Wildfire

INTENTIONALLY LEFT BLANK

4.1 Agriculture and Forestry Resources

This section describes the existing agriculture and forestry resources conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the project.

4.1.1 Existing Conditions

Agricultural soil is defined as soil that is utilized or suitable for agricultural crop production. The project site and immediately adjacent lands are designated on California Department of Conservation Important Farmland Maps as "Urban and Built-Up Land" and "Other Land" (DOC 2020). In addition, as shown in Figure 4.1-1, Williamson Act Land Contracts in Project Vicinity, the project site is not designated under a Williamson Act Contract. However, several nearby properties are under a Williamson Act Contract. Soils within the project site have been classified as Xerorthents, cut and fill areas (USDA 2011). Xerorthents can be rock, concrete, asphalt or other debris or earthy fill and typically consist of mechanically removed and mixed soil material in cut and fill areas used primarily for highways and urban development. Soils in the project area are rated as "Not Prime Farmland" (USDA NRCS 2011).

No agricultural resources or forest land are present within the project site nor have any been thought to exist in modern times.

4.1.2 Relevant Plans, Policies, and Ordinances

4.1.2.1 Federal

Farmland Protection Policy Act

The purpose of the Farmland Protection Policy Act (FPPA) is to minimize the extent to which federal programs contribute to the unnecessary and irreversible conversion of farmland to nonagricultural uses. Further, the FPPA directs federal programs to be compatible with state and local policies for the protection of farmlands. The FPPA does not authorize the federal government to regulate the use of private or non-federal land or in any way affect the property rights of owners of such land. Because the proposed project does not have federal involvement, the FPPA is not applicable in this situation.

4.1.2.2 State

California Department of Conservation

The California Department of Conservation (DOC) is the state agency that administers both the State Farmland Mapping and Monitoring Program (FMMP) and the California Land Conservation Act, more commonly known as "The Williamson Act." The Important Farmland Mapping Program compiles information of the state's important farmlands, including tracking farmland proposed for development, and provides this information to state and local government agencies for use in planning and for decision makers and decision-making bodies.

Farmland Mapping and Monitoring Program

The FMMP Important Farmland Maps are based on a classification system that combines technical soil ratings and current land use. Important Farmland Categories include Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, Grazing Land, Urban and Built-up Land, and Other Land. FMMP's Important Farmland Maps require that Prime Farmland, meet the following criteria: (1) Prime Farmland must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date, which equates to four years (DOC 2020); and (2) The soil must meet the physical and chemical criteria for Prime Farmland or Farmland of Statewide Importance as determined by the USDA NRCS. NRCS compiles lists of which soils in each survey area meet the quality criteria. Factors considered in qualification of a soil by NRCS (DOC 2020) include the following:

- Water moisture regimes, available water capacity, and developed irrigation water supply
- Soil temperature range
- Acid-alkali balance
- Water table
- Soil sodium content
- Flooding (uncontrolled runoff from natural precipitation)
- Erodibility
- Permeability rate
- Rock fragment content
- Soil rooting depth

The soils information presented in this analysis is derived from statewide soils maps that have been prepared by both state and federal government entities. The California DOC, Division of Land Resource Protection, and the USDA NRCS both conduct regular and ongoing assessments of soil types and then prepare detailed soil maps. Once soils are mapped, they are grouped into the following categories that have specific definitions. The categories and definitions are as follows:

Prime Farmland. In California, the FMMP maps all statewide farmlands. The FMMP's soils study area is contiguous with modem soil surveys developed by the USDA. The FMMP requires that any land designated as Prime must meet the criteria related to land use and soils. As such, farmland with the optimal combination of physical and chemical features to sustain long-term agriculture is described as Prime. The land has been determined to have the soil quality, growing season, and moisture supply needed to produce sustained high crop yields (DOC 2020).

Farmland of Statewide Importance. As with Prime Farmland, Farmland of Statewide Importance must also meet both the criteria described above with respect to land use and soils and is similar to the Prime Farmland category. The difference is that Farmland of Statewide Importance tolerates greater shortcomings of the soil, such as greater slopes or less ability to store moisture (DOC 2020).

Unique Farmland. This category of farmland is categorized as having lesser quality soils but is still used for the production of leading agricultural crops. This farmland is typically irrigated but can also include non-irrigated orchards or vineyards found in some climatic zones in the state. These lands must have been used for irrigated agricultural production at some time during the 4 years prior to the mapping date (DOC 2020).

Farmland of Local Importance. Lands that have been determined by local jurisdictional authorities such as county boards of supervisors or local advisory committees to have a specific importance to the local agricultural economy are considered Farmland of Local Importance (DOC 2020).

The FMMP has three other categories of land that are generally more limited in terms of agriculture value:

Grazing Land. Land that is particularly suited to the grazing of livestock given existing vegetation. This particular designation was developed in concert with the California Cattlemen's Association, University of California Cooperative Extension, and a host of other groups with an interest in grazing and livestock (DOC 2020).

Urban and Built-Up Land. This category refers to land that is occupied by structures with a building density of at least one unit to 1.5 acres or six structures to a 10-acre parcel. This category includes land uses such as residential, industrial, commercial, construction, institutional, public administration, railroad and other transportation yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment plants, water control structures, and other developed purposes (DOC 2020).

Other Land. All other lands that do not fall into the categories above are subsumed into this category. Examples of these lands include low-density rural developments, brush, timber wetland, riparian areas not suitable for livestock grazing, confined livestock poultry or aquaculture facilities, strip mines, borrow pits, and water bodies smaller than 40 acres. In addition, vacant and nonagricultural land surrounded on all sides by urban development and greater than 40 acres is mapped as Other Land (DOC 2020).

The California Land Conservation Act of 1965

The California Land Conservation Act of 1965, better known as the Williamson Act as mentioned above, provides for reduced property taxation on agricultural land in exchange for a 10-year continuously rolling agreement. The purpose of the Williamson Act is the long-term conservation of agricultural and open space lands. The act establishes a program to enroll land in Williamson Act whereby the land is restricted to agricultural, open space, or recreational uses or uses deemed to be "compatible" with the agricultural land uses or compatible recreational uses as outlined in the act in exchange for reduced property tax assessments. The Act requires that each participating local government has a set of uniform rules for administering Williamson Act and Farmland Security Zone contracts within its jurisdiction. None of the project site is under a Williamson Act contract. Several nearby properties are under a Williamson Act contract as shown on Figure 4.1-1.

Farmland Security Zone Act

The Farmland Security Zone Act is similar to the Williamson Act and was passed by the California State Legislature in 1999 to ensure that long-term farmland preservation is part of public policy (California Government Code Section 51296–51297.4). Farmland Security Zone Act contracts are sometimes referred to as "Super Williamson Act Contracts." Under the provisions of this act, a landowner already under a Williamson Act contract can apply for Farmland Security Zone status by entering into a contract with the county. Farmland Security Zone contracts must be for an initial term of at least 20 years. As with Williamson Act contracts, each year an additional year is automatically added to the contract term unless a notice of nonrenewal is given. In return for a further 35% reduction in the property tax value of land and growing improvements (in addition to Williamson Act tax benefits), the owner of the property promises not to develop the property into nonagricultural uses during the term of the contract. Farmland Security Zone contracts may also be cancelled, but only upon finding that cancellation would both service the purposes of the Williamson Act, and that cancellation would be in the public interest (California Government Code, Section 51297). None of the project site is under a Farmland Security Zone contract.

California Public Resources Code

The California Public Resources Code defines "forest land" and "timberland" as follows (California Public Resources Code, Sections 12200[g] and 4526, respectively):

> 'Forest land' is land that can support 10% native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.
>
> 'Timberland' means land, other than land owned by the federal government and land designated by the board [State Board of Forestry and Fire Protection] as experimental forest land, which is available for, and capable of, growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees. Commercial species shall be determined by the board on a district basis after consultation with the district committees and others.

4.1.2.3 Local

The Santa Barbara County Uniform Rules for Agricultural Preserves and Farmland Security Zones (referred to as "Uniform Rules") are the set of rules the County uses to implement the Agricultural Preserve program, established by the California Land Conservation Act of 1965, also known as the Williamson Act. The Williamson Act enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space use. In return, landowners receive property tax assessments which may be lower than normal because they are based upon farming and open space uses as opposed to full market value (County of Santa Barbara 2018).

The Uniform Rules define eligibility requirements and qualifying uses that each participating landowner must follow in order to receive a reduced property tax assessment under the Williamson Act. Often the Uniform Rules are more restrictive than the underlying agricultural zoning requirements. The County of Santa Barbara's Agricultural Preserve program has a high level of participation, covering approximately 550,000 acres, representing approximately 75% of all privately held agricultural lands in the County.

4.1.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to agriculture and forestry resources are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to agriculture and forestry resources would occur if the project would:

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use.
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract.
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)).
d) Result in the loss of forest land or conversion of forest land to non-forest use.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

f) Result in cumulatively considerable impacts to agriculture and forestry resources.

4.1.4 Impact Analysis

a) Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?

No Impact. As discussed under Sections 4.1.1 and 4.1.2, the California Department of Conservation State FMMP designates soils occurring within the project site as "Urban and Built-Up Land" and "Other Land" (DOC 2020). These categories are not considered suitable to support agriculture, but instead are suited to land uses such as residential, industrial, commercial, construction, institutional, public administration, railroad and other transportation yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment plants, water control structures, and other developed purposes (DOC 2020).

As such, the proposed project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use. Therefore, there would be **no impact** and no mitigation measures are required.

b) Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact. The portion of the project site within the City has been zoned for Resort Zone District use (City of Carpinteria 2016), while the portion within the County of Santa Barbara is zoned Transportation Corridor and Recreation (County of Santa Barbara 2020); consequently none of the project site carries agricultural zoning. As discussed above, the project site is not enrolled in a Williamson Act contract. Therefore, the proposed project would not conflict with existing zoning for agricultural use nor with a Williamson Act contract and as such, **no impact** would occur and no mitigation measures are required.

c) Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact. As discussed above and in Sections 4.1.2.2 and 4.1.2.3, the project site does not contain any forest or timberland, and is not zoned for forest land, timberland, or timberland production, as defined in the California Public Resources Code and Government Code. California Public Resources Code, Section 12220(g), defines "forest land" for the purposes of CEQA as land that can support 10% native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.

California Government Code Section 51104(g) defines "Timber," "Timberland," and "Timberland Production Zone" for the purposes of CEQA as either trees of any species maintained for eventual harvest for forest production purposes ("Timber"); privately owned land, or land acquired for state forest purposes, used for growing and harvesting timber ("Timberland"); or "Timberland Production Zone" which means an area zoned and used for growing and harvesting timber.

As such, the proposed project would not conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government code section 51104(g)). Therefore, **no impact** would occur, and no mitigation measures are required.

d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?

As discussed under Sections 4.1.1 and 4.1.2, there are no existing forest lands located on the project site or in the vicinity of the site as defined in the California Public Resources Code or Government Code 51104(g)). The proposed project would construct a 16-foot wide (10-foot wide path with 3-foot wide paved shoulder along both sides) and approximately 2,800-foot long shared-use trail that would provide safe access for bicyclists and pedestrians traveling from Carpinteria Avenue in the City of Carpinteria to Rincon Beach County Park in Santa Barbara County at the Ventura County line; this use would not prevent adjacent areas from supporting forest uses in the future. The proposed project would also not result in loss of any existing forest land. **No impact** would occur, and no mitigation measures are required.

e) Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

No Impact. As discussed under Sections 4.1.1 and 4.1.2, the project site has no agricultural resources or forest land within the area of project effect, nor have any been thought to exist in modern times. The proposed project would construct a 16-foot wide (10-foot wide path with 3-foot wide paved shoulder along both sides) and approximately 2,800-foot long shared-use trail that would connect existing bike and pedestrian facilities on Carpinteria Avenue in the City of Carpinteria to Rincon Beach County Park in Santa Barbara County. Because the project would close a gap in existing trail systems, and in that use of the trail by pedestrians and cyclists would not affect the productivity of existing agriculture and forest lands in the region, the proposed project would not cause other changes that would result in conversion of Farmland to non-agricultural use or forest land to non-forest use. Therefore, **no impact** would occur, and no mitigation measures are required.

f) Would the project result in cumulatively considerable impacts to agriculture and forestry resources?

No Impact. As discussed under Sections 4.1.1 and 4.1.2, the project site has no agricultural resources or forest land within the project site nor have any been thought to exist in modern times. The proposed project would not convert agricultural land to non-agricultural uses nor convert forest land to non-forest use. Therefore, the proposed project would not contribute to a cumulative impact. As such, **no impact** would occur, and no mitigation measures are required.

4.1.5 Level of Significance Prior to Mitigation

As discussed above, no significant direct or indirect impacts related to agriculture and forestry resources would result from the proposed project.

4.1.6 Conclusion

As described above, the project site has no agricultural resources or forest land within the project site nor have any been thought to exist in modern times. The proposed project would not conflict with agriculturally zoned land and would not convert any agricultural, farmland or forest land to other uses. The proposed project would also not conflict with any regulatory federal, state, and local policies. Therefore, there would be no impact.

Williamson Act Land Contracts in Project Vicinity

Carpinteria Rincon Trail EIR

INTENTIONALLY LEFT BLANK

4.2 Energy

This section describes the existing energy conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the project.

4.2.1 Existing Conditions

4.2.1.1 Electricity

According to the U.S. Energy Information Administration (EIA), California used approximately 250,379 gigawatt hours of electricity in 2017 (EIA 2019a). By sector in 2017, commercial uses utilized 46% of the state's electricity, followed by 35% for residential uses, and 19% for industrial uses (EIA 2019a). Electricity usage in California for differing land uses varies substantially by the type of uses in a building, type of construction materials used in a building, and the efficiency of all electricity-consuming devices within a building. Due to the state's energy efficiency building standards and efficiency and conservation programs, California's electricity use per capita in the commercial sector is lower than any other state except Hawaii (EIA 2018).

Southern California Edison (SCE) provides electricity to the project. SCE, a subsidiary of Edison International, serves approximately 180 cities in 11 counties across central and Southern California. According to the California Public Utilities Commission (CPUC), approximately 84 billion kilowatt-hours of electricity were used in SCE's service area in 2017. Demand forecasts anticipate that approximately 75 billion kilowatt-hours of electricity would be used in SCE's service area in 2020 (CPUC 2018).

SCE receives electric power from a variety of sources. According to the 2018 SCE Power Content Label, SCE has renewable energy at 36% of its overall energy resources, with geothermal resources at 8%, wind power at 13%, large hydroelectric sources at 1%, and solar energy is at 13% (SCE 2019). The California Renewables Portfolio Standard (RPS) Program establishes a goal for California to increase the amount of electricity generated from renewable energy resources to 20% by 2010, and to 33% by 2020. Recent legislation revised the current RPS target for California to obtain 50% of total retail electricity sales from renewable sources by 2030, with interim targets of 40% by 2024, and 45% by 2027 (CPUC 2016).

4.2.1.2 Natural Gas

According to the California Energy Commission (CEC), California used approximately 2,154,030 cubic feet of natural gas in 2019 (EIA 2019b). In 2017 (the most recent year for which data is available), by sector, industrial uses utilized 37% of the state's natural gas, followed by 32% from electric power, 19% from residential, 11% from commercial, and 1% from transportation uses (CEC 2018a). While the supply of natural gas in the United States and production in the lower 48 states has increased greatly since 2008, California produces little, and imports 90% of its supply of natural gas (EIA 2019b).

The Southern California Gas Company (SoCalGas) provides the project with natural gas service. The territory serviced by SoCalGas encompasses approximately 20,000 square miles and more than 500 communities. In the California Energy Demand mid-energy demand scenario, natural gas demand is projected to have an annual growth rate of 0.03% in SoCalGas's service territory. As of 2017, approximately 7.2 billion therms were used in SoCalGas's

service area per year. Around the time of project construction in 2022, natural gas demand is anticipated to be approximately 7.7 billion therms per year in SoCalGas's service area (CEC 2018c). In 2020, the total capacity available is also estimated to be 3.9 billion cubic feet per day[1] (California Gas and Electric Utilities 2020). This amount is approximately equivalent to 3.98 billion thousand British thermal units (kBTU) per day or 39.8 million therms per day. Over the course of a year, the available capacity would therefore be 14.5 billion therms per year, which is well above the existing and future anticipated natural gas demand in the area serviced by SoCalGas.

4.2.1.3 Petroleum

According to the CEC, California used approximately 24.5 billion gallons of petroleum in 2018 (EIA 2019c). This equates to a daily use of approximately 51 million gallons of petroleum. By sector, transportation uses utilize approximately 85.5% of the state's petroleum, followed by 11.1% from industrial, 2.5% from commercial, 0.9% from residential, and 0.01% from electric power uses (EIA 2018). In California, petroleum fuels refined from crude oil are the dominant source of energy for transportation sources. Petroleum usage in California includes petroleum products such as motor gasoline, distillate fuel, liquefied petroleum gases, and jet fuel. Production of petroleum in the United States was 9.7 million barrels per day during April 2015, which was the highest output since April 1971 (CEC 2016).

4.2.2 Relevant Plans, Policies, and Ordinances

4.2.2.1 Federal

Federal Energy Policy and Conservation Act

In 1975, Congress enacted the Federal Energy Policy and Conservation Act, which established the first fuel economy standards for on-road motor vehicles in the United States. Pursuant to the act, the National Highway Traffic Safety Administration is responsible for establishing additional vehicle standards. In 2012, new fuel economy standards for passenger cars and light trucks were approved for model years 2017 through 2021 (77 FR 62624–63200). Fuel economy is determined based on each manufacturer's average fuel economy for the fleet of vehicles available for sale in the United States.

Energy Independence and Security Act of 2007

On December 19, 2007, the Energy Independence and Security Act of 2007 (EISA) was signed into law. In addition to setting increased corporate average fuel economy standards for motor vehicles, the EISA includes the following other provisions related to energy efficiency:

- Renewable Fuel Standard (RFS) (Section 202)
- Appliance and Lighting Efficiency Standards (Sections 301–325)
- Building Energy Efficiency (Sections 411–441)

This federal legislation (the RFS) requires ever-increasing levels of renewable fuels to replace petroleum (EPA 2013). The U.S. Environmental Protection Agency is responsible for developing and implementing regulations to ensure that transportation fuel sold in the United States contains a minimum volume of renewable fuel. The RFS program regulations were developed in collaboration with refiners, renewable fuel producers, and many other stakeholders.

[1] One cubic foot of natural gas has approximately 1,020 BTUs of natural gas or 1.02 kBTUs of natural gas.

The RFS program was created under the Energy Policy Act of 2005 and established the first renewable fuel volume mandate in the United States. As required under the act, the original RFS program (RFS1) required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012. Under the EISA, the RFS program was expanded in several key ways that lay the foundation for achieving significant reductions in greenhouse gas (GHG) emissions from the use of renewable fuels, reducing imported petroleum, and encouraging the development and expansion of the renewable fuels sector in the United States. The updated program (RFS2) includes the following:

- EISA expanded the RFS program to include diesel, in addition to gasoline.
- EISA increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022.
- EISA established new categories of renewable fuel, and set separate volume requirements for each one.
- EISA required the U.S. Environmental Protection Agency to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces.

Additional provisions of the EISA address energy savings in government and public institutions, research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green" jobs.

4.2.2.2 State

Warren-Alquist Act

The California Legislature passed the Warren–Alquist Act in 1974, which created the CEC. The legislation also incorporated the following three key provisions designed to address the demand side of the energy equation:

- It directed the CEC to formulate and adopt the nation's first energy conservation standards for both buildings constructed and appliances sold in California.
- The act removed the responsibility of electricity demand forecasting from the utilities, which had a financial interest in high-demand projections, and transferred it to a more impartial CEC.
- The CEC was directed to embark on an ambitious research and development program, with a particular focus on fostering what were characterized as non-conventional energy sources.

Integrated Energy Policy Report (IEPR)

Senate Bill 1389 (Bowen, Chapter 568, Statutes of 2002) requires the CEC to prepare a biennial integrated energy policy report that assesses major energy trends and issues facing the state's electricity, natural gas, and transportation fuel sectors and provides policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the state's economy; and protect public health and safety (California Public Resources Code, Section 25301a). The Energy Commission prepares these assessments and associated policy recommendations every two years, with updates in alternate years, as part of the Integrated Energy Policy Report.

The 2019 IEPR was adopted January 31, 2020, and continues to work towards improving electricity, natural gas, and transportation fuel energy use in California. The 2019 IEPR focuses on a variety of topics such as including the environmental performance of the electricity generation system, landscape-scale planning, the response to the gas leak at the Aliso Canyon natural gas storage facility, transportation fuel supply reliability issues, updates on

Southern California electricity reliability, methane leakage, climate adaptation activities for the energy sector, climate and sea level rise scenarios, and the California Energy Demand Forecast (CEC 2019). The 2020 IEPR Update is currently in progress but is not anticipated to be adopted until February 2021.

State of California Energy Action Plan

The CEC and California Public Utility Commission (CPUC) approved the first State of California Energy Action Plan in 2003. The plan established shared goals and specific actions to ensure the provision of adequate, reliable, and reasonably priced electrical power and natural gas supplies; it also identified cost-effective and environmentally sound energy policies, strategies, and actions for California's consumers and taxpayers. In 2005, the CEC and CPUC adopted a second Energy Action Plan to reflect various policy changes and actions of the prior 2 years.

At the beginning of 2008, the CEC and CPUC determined that it was not necessary or productive to prepare a new energy action plan. This determination was based, in part, on a finding that the state's energy policies have been significantly influenced by the passage of Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006 (discussed below). Rather than produce a new energy action plan, the CEC and CPUC prepared an "update" that examines the state's ongoing actions in the context of global climate change.

Senate Bill 1078 (2002)

Senate Bill (SB) 1078 established the California Renewable Portfolio Standard (RPS) Program and required that a retail seller of electricity purchase a specified minimum percentage of electricity generated by eligible renewable energy resources as defined in any given year, culminating in a 20% standard by December 31, 2017. These retail sellers include electrical corporations, community choice aggregators, and electric service providers. The bill relatedly required the CEC to certify eligible renewable energy resources, design and implement an accounting system to verify compliance with the RPS by retail sellers, and allocate and award supplemental energy payments to cover above-market costs of renewable energy.

Senate Bills 107 (2006), X1-2 (2001), 350 (2015), and 100 (2018)

SB 107 (2006) accelerated the RPS established by SB 1078 by requiring that 20% of electricity retail sales be served by renewable energy resources by 2010 (not 2017). Additionally, SB X1-2 (2011) requires all California utilities to generate 33% of their electricity from eligible renewable energy resources by 2020. Specifically, SB X1-2 sets a three-stage compliance period: by December 31, 2013, 20% had to come from renewables; by December 31, 2016, 25% had to come from renewables; and by December 31, 2020, 33% will come from renewables.

SB 350 (2015) requires retail seller and publicly owned utilities to procure 50% of their electricity from eligible renewable energy resources by 2030, with interim goals of 40% by 2024 and 45% by 2027.

SB 100 (2018) increased the standards set forth in SB 350. The bill establishes that 44% of the total electricity sold per year to retail customers in California be secured from qualifying renewable energy sources by December 31, 2024, with that number increasing to 52% by December 31, 2027, and 60% by December 31, 2030. SB 100 states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California. This bill requires that the achievement of 100% zero-carbon electricity resources do not increase the carbon emissions elsewhere in the western grid and that the achievement not be met through resource shuffling.

Consequently, utility energy generation from non-renewable resources is expected to be reduced based on implementation of the 60% RPS in 2030. Therefore, any project's reliance on non-renewable energy sources would also be reduced.

Assembly Bill 1007 (2005)

AB 1007 (2005) required the CEC to prepare a statewide plan to increase the use of alternative fuels in California (State Alternative Fuels Plan). The CEC prepared the plan in partnership with the California Air Resources Board (CARB) and in consultation with other state agencies, plus federal and local agencies. The State Alternative Fuels Plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation of public health and environmental quality.

Assembly Bill 32 (2006) and Senate Bill 32 (2016)

In 2006, the state legislature enacted Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006. AB 32 requires California to reduce its GHG emissions to 1990 levels by 2020. In 2016, the Legislature enacted SB 32, which extended the horizon year of the state's codified GHG reduction planning targets from 2020 to 2030, requiring California to reduce its GHG emissions to 40% below 1990 levels by 2030. In accordance with AB 32 and SB 32, CARB prepares scoping plans to guide the development of statewide policies and regulations for the reduction of GHG emissions. Many of the policy and regulatory concepts identified in the scoping plans focused on increasing energy efficiencies, using renewable resources, and reducing the consumption of petroleum-based fuels (such as gasoline and diesel). As such, the state's GHG emissions reduction planning framework creates co-benefits for energy-related resources. Additional information on AB 32 and SB 32 is provided in Section 4.6.2 in Section 4.6, Greenhouse Gas Emissions, of this EIR.

California Building Standards

Part 6 of Title 24 of the California Code of Regulations was established in 1978 and serves to enhance and regulate California's building standards. Part 6 establishes energy efficiency standards for residential and non-residential buildings constructed in California to reduce energy demand and consumption. Part 6 is updated periodically to incorporate and consider new energy efficiency technologies and methodologies.

The 2019 Title 24 standards are the currently applicable building energy efficiency standards, and became effective on January 1, 2020. The 2019 Title 24 Building Energy Efficiency Standards would further reduce energy used and associated GHG emissions compared to prior standards. In general, single-family residences built to the 2019 standards are anticipated to use approximately 7% less energy due to energy efficiency measures than those built to the 2016 standards; once rooftop solar electricity generation is factored in, single-family residences built under the 2019 standards would use approximately 53% less energy than those under the 2016 standards (CEC 2018b). Nonresidential buildings built to the 2019 standards are anticipated to use an estimated 30% less energy than those built to the 2016 standards (CEC 2018b).

State Vehicle Standards

In response to the transportation sector accounting for more than half of California's carbon dioxide emissions, AB 1493 was enacted in 2002. AB 1493 required CARB to set GHG emissions standards for passenger vehicles, light-duty trucks, and other vehicles determined by the state board to be those whose primary use is noncommercial

personal transportation in the state. The bill required that CARB set GHG emissions standards for motor vehicles manufactured in 2009 and all subsequent model years. The 2009 through 2012 standards resulted in a reduction in approximately 22% of GHG emissions compared to emissions from the 2002 fleet, and the 2013 through 2016 standards resulted in a reduction of approximately 30%.

In 2012, CARB approved a new emissions-control program for model years 2017 through 2025. The program combines the control of smog, soot, and global-warming gases with requirements for greater numbers of zero-emissions vehicles into a single package of standards called Advanced Clean Cars. By 2025, when the rules would be fully implemented, new automobiles would emit 34% fewer global-warming gases and 75% fewer smog-forming emissions (CARB 2012).

Although the focus of the state's vehicle standards is on the reduction of air pollutants and GHG emissions, one co-benefit of implementation of these standards is a reduced demand for petroleum-based fuels.

Sustainable Communities Strategy

The Sustainable Communities and Climate Protection Act of 2008, or SB 375, coordinates land use planning, regional transportation plans, and funding priorities to help California meet its GHG emissions reduction mandates. As codified in California Government Code Section 65080, SB 375 requires metropolitan planning organizations (e.g., Southern California Association of Governments) to include a Sustainable Communities Strategy in their regional transportation plan. The main focus of the Sustainable Communities Strategy is to plan for growth in a fashion that will ultimately reduce GHG emissions, but the strategy is also part of a bigger effort to address other development issues, including transit and vehicle miles traveled (VMT), which influence the consumption of petroleum-based fuels.

4.2.2.3 Local

Santa Barbara County Comprehensive Plan

Goals and policies pertaining to Energy are addressed in the Energy Element of the comprehensive plan (County of Santa Barbara 2015a). The following goals and policies from the Energy Element are applicable to the project:

Goal 3 Transportation and Land Use

Provide a composition of land-uses and transportation programs that reduces dependency on automobiles.

Policy 3.1 Alternative Transportation and Support Facilities

Enhance opportunities for alternative transportation

Research 3.1.1 The County, in coordination with the Santa Barbara County Association of Governments and cities within the County, shall prepare a report for the Board of Supervisors which provides details on enhancing alternative transportation (e.g., mass transit, vanpools, bikeways, etc.). The report shall include the following tasks:

a) Identify steps that would increase transportation, considering factors of attractiveness, and cost-savings;

b) Ridership of alternative security, convenience,

c) Estimate expected increase in ridership affected by each step;

d) Estimate the financial investment necessary to implement each step

e) Recommend those steps that appear to present the most return on investment;

f) Evaluate all existing, projected and potential funding sources for the purpose of enhancing investment in alternative transportation; and

g) Recommend steps to realize needed funding.

Public Service 3.1.1 The County shall continue to develop programs that encourage the use of alternative modes of transportation, including bike-and-ride and park-and-ride facilities.

Public Service 3.1.2 The County shall work with the Santa Barbara County Association of Governments and adjacent jurisdictions to pursue a commuter rail system as a potential mass transit option for the County.

Public Service 3.1.3 The County shall work with the Santa Barbara County Association of Governments, appropriate organizations, local mass transit agencies, educational institutions, driver education, Department of Motor Vehicle, etc., to inform the public about available transportational choices, and to inform the transit agencies about ways to make alternative transportation more attractive, etc.

Policy 3.4 Recreation Near Homes

Encourage coordination of scheduling recreational events (e.g., organized sports, arts and handicrafts for minors) at locations that would reduce recreation-related transportation by automobile.

Public Service 3.4.1 The County should work with local recreational organizations and schools to encourage neighborhood-based recreational practices and events to reduce vehicular trips.

Regulatory Incentive 3.4.1: The County should seek to designate and establish neighborhood parks when preparing Community Plans.

Policy 3.5 Bikeways and Support Facilities

The County shall consider the completion of an integrated bikeway system, linking residences with commercial centers, work locations, schools, parks and mass transit facilities to be a high priority for promoting the use of the bicycle as an alternative mode of transportation.

Research 3.5.1 See Research 3.1.1; bikeways shall be included in this study.

Public Service 3.5.1: The County shall continue to work with Santa Barbara County Association of Governments, local jurisdictions, bicycle organizations, educational institutions, driver education, Department of Motor Vehicles, and Caltrans to develop outreach programs designed to inform the public of available transportational choices. Outreach programs shall include:

a) Information on existing and proposed bikeways;
b) Information on cycling safety, commuting and recreational issues; and
c) Information on how much money a person can save by bicycling to work or using mass transit

Public Service 3.5.2 The County shall encourage the Santa Barbara County Association of Government (SBCAG) to continue to encourage bicycling. Pro-active efforts shall continue to help jurisdictions with fund-raising, coordination between jurisdictions, focusing on intermodal links, dissemination of information, etc. If and when this effort requires dedication of additional staff time, the County should encourage SBCAG to so dedicate this time.

Public Service 3.5.3 The County shall continue to commit staff to facilitate bicycle planning, design, construction, and maintenance of bikeways and supporting facilities, updating the Bicycle Element, including efforts to fund these activities from outside grants.

Public Service 3.5.4 To the extent feasible, the County shall accommodate bicycle lanes in all new roadway improvements consistent with adopted bikeway plans.

Public Service 3.5.5 The County should encourage all of the cities within the county to provide safe bicycle access to all major county facilities through construction of bicycle paths, lighting, signage, etc.

Public Service 3.5.6 The County shall survey bike use (count bicycles) during traffic counts to measure the effectiveness of these programs.

Public Service 3.5.7 The County shall encourage and work with the local transit agencies to equip buses with bicycle racks and coordinate location of transit facilities with bicycle access.

Policy 3.6 Pedestrian-Oriented Designs

The County shall improve the convenience, comfort and safety for pedestrians.

Public Service 3.6.1 The County shall develop a list of recommendations for designing pedestrian-oriented facilities; the recommendations shall include details on widths of sidewalks, providing direct paths, lighting requirements, promoting signage, locating parking lots behind buildings, pedestrian-scale access, visual interest, etc.

Encouragement 3.6.1 New development should include direct, safe and pleasant pedestrian routes connecting new and existing origins and destinations.

Goal 4 Water Use and Solid Waste

Increase the efficiency of water and resource use to reduce energy consumption associated with various phases of using resources (pumping, distribution, treatments, heating, etc.).

Policy 4.1 Construction

Encourage recycling and reuse of construction waste to reduce energy consumption associated with extracting and manufacturing virgin materials.

Public Service 4.1.1 The County will serve as a source of information regarding current markets and collection services for recycling and reuse of construction-generated waste.

Public Service 4.1.2 The County, in coordination with Ventura and San Luis Obispo counties, and cities within these counties, should develop a local guide to recycled construction products.

Public Service 4.1.3 To encourage recycling and use of recycled materials in construction and demolition, copies of *A Resource Guide to Recycled Construction Products and Energy Efficiency* published by the Public Works Department, Integrated Solid Waste Management Office, City of Los Angeles, and *California Materials Exchange (CALMAX)* published by California Integrated Waste Management Board, and any local version that is developed, shall be distributed by the County with issuance of a building or demolition permit.

Encouragement 4.1.1 The County should require an initial assessment of construction-generated waste and require recycling bins at those construction sites where it would be feasible for the contractor to recycle the material. County should consider this encouragement to be feasible when added cost for recycling, if any, is minimal compared to the overall benefits of recycling, and when recyclers are regionally accessible.

Encouragement 4.1.2 The County shall develop guidelines for managing construction-generated wastes. These guidelines must be economically feasible for the contractor, considering the constraints of a highly competitive industry. Once guidelines have been developed, new developments would be recommended to recycle construction waste.

Policy 4.2 Recycled Materials

The County shall require adequate areas for collecting and loading recyclable materials in development projects, and shall further address recycling logistics in its zoning ordinance.

Encouragement 4.2.1 The County shall amend the zoning ordinances to include a recycling access ordinance by following the Model Ordinance developed by the California Integrated Waste Management Board. [The Solid Waste Reuse and Recycling Act requires the adoption of a recycling access ordinance, or adoption of the state's model ordinance.]

Regulatory Incentive 4.2.1 The County shall revise its zoning ordinances as appropriate to alleviate or reduce unnecessary impediments that may inhibit recycling.

Policy 4.3 Reuse of Asphalt

Promote reuse of asphalt removed from roads and paved structures within the county and use of recycled materials in roadway and paved surface construction.

Internal Action 4.3.1 The County shall increase applications of reusing existing road materials and use of recycled materials (e.g., asphalt-rubber, recycled base material, crush rock material, recycled toilets, and the cold in-place method of re-paving), when feasible.

Policy 4.8 Water Efficient Landscaping

The County shall require (per Government Code, Section 65590, Article 10.8) water-efficient landscape design and irrigation systems in new and renovated developments and at public parks and facilities. [Energy-savings are accrued through reduced water pumping and treatment, and reduced disposal and maintenance.]

Encouragement 4.8.1 To encourage energy conservation and as required by Groundwater Policy 3.6 of the Conservation Element, water-conserving landscaping and irrigation shall be incorporated into all new developments, where appropriate, effective, and consistent with applicable law.

Internal Action 4.8.1 The County shall continue to give priority to native and drought-tolerant plants and to install water-efficient irrigation at County parks and facilities.

Energy and Climate Action Plan

The County's Energy and Climate Action Plan (ECAP) as discussed in Section 3.6.2.3 also addresses energy use within the County (County of Santa Barbara 2015b). Although the ECAP established greenhouse gas reduction goals for the County, the measures with which the County would reduce greenhouse gas emissions to meet those goals included those to reduce energy consumption. Measures to reduce energy consumption within the ECAP include implementation of Community Choice Energy, renewable energy, and industrial energy efficiency.

City of Carpinteria

The City has adopted measures within its Open Space, Recreation & Conservation Element of its General Plan to reduce energy consumption (City of Carpinteria 2003). Measures identified within Section 3.6.2.3 for reducing GHG emissions would also help to reduce energy consumption.

The City also adopted the Energy Action Plan in August 2016 (City of Carpinteria 2016) to identify the City of Carpinteria's long term vision and goals on achieving energy efficiency in local government facilities. This document specifically addresses energy consumption by the City's facilities and operations. The City of Carpinteria aims to increase the energy efficiency in their own facilities in order minimize energy costs and protect the environment, with the understanding that energy generation is directly related to greenhouse gas emissions. This document is intended to reduce greenhouse gas emissions and lower municipal energy costs by identifying projects and priorities for energy efficiency work throughout the City's facilities and operations.

The Energy Action Plan will outline a strategy for increased energy efficiency, based on available funding and energy reduction goals. The following sections include: an outline of the City's current work in the field of energy efficiency; energy usage data across municipal buildings and operations; and goals for energy reduction from 2015 baseline levels. Specifically, this EAP outlines a goal of a 15% reduction in electricity consumption from the 2015 baseline level by the year 2020. The function of the EAP is to serve as a working document that allows the City of Carpinteria flexibility if new regulations are adopted, new facilities are brought online, or new funding sources become available.

4.2.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to energy are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to energy would occur if the project would:

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

4.2.4 Impact Analysis

a) Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Electricity

Construction Use

Temporary electric power for as-necessary lighting and electronic equipment, such as computers, may be needed inside temporary construction trailers. However, the electricity used for such activities would be temporary and would have a negligible contribution to the project's overall energy consumption.

Operational Use

The project does not include any components that would require the use of electricity during operation. Therefore, the project would have no impact on electricity during operation.

Natural Gas

Construction Use

Natural gas is not anticipated to be required during construction of the project. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed below under the "petroleum" subsection. Any minor amounts of natural gas that may be consumed as a result of project construction would have a negligible contribution to the project's overall energy consumption.

Operational Use

Similar to electricity, the project does not include any components that would require the use of natural gas during operation. Therefore, the project would have no impact on natural gas during operation.

Petroleum

Construction Use

Petroleum would be consumed throughout construction of the project. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction, and VMT associated with the transportation of construction materials and construction worker commutes would also result in petroleum consumption. Heavy-duty construction equipment associated with construction activities, and haul trucks involved in relocating dirt around the project site would rely on diesel fuel. Construction workers would travel to and from the project site throughout the duration of construction. It is assumed that construction workers would travel to and from the project site in gasoline-powered vehicles.

Heavy-duty construction equipment of various types would be used during construction. CalEEMod was used to estimate construction equipment usage; results are included in Appendix B. Based on that analysis, diesel-fueled construction equipment would operate for an estimated 95,616 hours.

Fuel consumption from construction equipment was estimated by converting the total CO_2 emissions from each construction phase to gallons using conversion factors for CO_2 to gallons of gasoline or diesel. The conversion factor for gasoline is 8.78 kilograms per metric ton CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton CO_2 per gallon (The Climate Registry 2020). The estimated diesel fuel use from construction equipment is shown in Table 4.2-1.

Table 4.2-1. Construction Equipment Diesel Demand

Phase	Pieces of Equipment	Equipment CO_2 (MT)[a]	kg CO_2/Gallon[b]	Gallons
Site Preparation	3	24.18	10.21	2,368.70
Grading	3	143.12	10.21	14,017.49
Trail Construction	2	38.74	10.21	3,794.38
Bridge Construction	5	6.38	10.21	625.27

Table 4.2-1. Construction Equipment Diesel Demand

Phase	Pieces of Equipment	Equipment CO_2 (MT)[a]	kg CO_2/Gallon[b]	Gallons

Notes: CO_2 = carbon dioxide; MT = metric ton; kg = kilogram.

Fuel consumption from worker and vendor trips was estimated by converting the total CO_2 emissions from the construction phase to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. Worker vehicles are assumed to be gasoline fueled, and vendor/hauling vehicles are assumed to be diesel fueled. Calculations for total worker, vendor, and hauler fuel consumption are provided in Table 4.2-2, Table 4.2-3, and Table 4.2-4.

Table 4.2-2. Construction Worker Vehicle Gasoline Demand

Phase	Trips	Vehicle CO_2 (MT)[a]	kg CO_2/Gallon[b]	Gallons

As shown in Tables 4.2-1 through 4.2-4, the project is estimated to consume approximately 69,257 gallons of petroleum during the construction phase. By comparison, approximately 27.9 billion gallons of petroleum would be consumed in California over the course of the project's construction phase, based on the California daily petroleum consumption estimate of approximately 52.9 million gallons per day (CEC 2019). In 2022, the total mobile source petroleum consumption within the County of Santa Barbara is estimated to be 164 million gallons (CARB 2020). In 2022, the total construction equipment petroleum consumption within the County of Santa Barbara is estimated to be 2.9 million gallons (CARB 2020). The project would also be required to comply with CARB's Airborne Toxics Control Measures, which restrict heavy-duty diesel vehicle idling time to five minutes. The project would be subject to the In-Use Off-Road Diesel-Fueled Fleets Regulation (Off-Road Regulation) which applies to all self-propelled off-road diesel vehicles 25 horsepower or greater used in California and most two-engine vehicles (except on-road two-engine sweepers). This includes vehicles that are rented or leased (rental or leased fleets). The Off-Road Regulation also requires off-road equipment fleets to become more efficient over-time through equipment retrofits, replacements, or retirements. The fleet must either show that its fleet average index was less than or equal to the calculated fleet average target rate, or that the fleet has met the Best Achievable Control Technology (BACT) requirements.

Operational Use

The project would result in petroleum consumption during operation due to periodic maintenance of the trail. As discussed in Section 3.2.4, it was assumed that one employee vehicle would travel to the site per week. Fuel consumption from construction equipment was estimated by converting the total CO_2 emissions from each construction phase to gallons using conversion factors for CO_2 to gallons of gasoline or diesel. The conversion factor for gasoline is 8.78 kilograms per metric ton CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton CO_2 per gallon (The Climate Registry 2020). The project is estimated to consume 17 gallons of gasoline and 1 gallon of diesel per year, for a total of 18 gallons of petroleum per year. By comparison, California as a whole consumes approximately 19.3 billion gallons of petroleum per year (CEC 2019). It is forecasted that in 2024, approximately 156 million gallons of petroleum in Santa Barbara County will be consumed (CARB 2020).

Over the lifetime of the project, the fuel efficiency of the vehicles being used by the residents is expected to increase. As such, the amount of petroleum consumed as a result of vehicular trips to and from the project site during operation would decrease over time. There are numerous regulations in place that require and encourage increased fuel efficiency. For example, as mentioned previously, CARB has adopted an approach to passenger vehicles by combining the control of smog-causing pollutants and GHG emissions into a single,

coordinated package of standards. The approach also includes efforts to support and accelerate the number of plug-in hybrids and zero-emissions vehicles in California (CARB 2013). Additionally, in response to SB 375, CARB adopted the goal of reducing per-capita GHG emissions from 2005 levels by 8% by 2020, and 18% by 2035 for light-duty passenger vehicles in the planning area for SBCAG. As such, operation of the project is expected to use decreasing amounts of petroleum over time due to advances in fuel economy.

Significance of Impact

Electricity

The electricity used for construction activities would be temporary and would have a negligible contribution to the project's overall energy consumption. The project would not consume electricity during operation. Therefore, the electricity consumption of the project would not be inefficient or wasteful, and impacts would be **less than significant**.

Natural Gas

The natural gas used for construction activities would be temporary and would have a negligible contribution to the project's overall energy consumption. The project would not consume natural gas during operation. Therefore, the natural gas consumption of the project would not be inefficient or wasteful, and impacts would be **less than significant**.

Petroleum

In summary, because petroleum use during construction would be temporary and relatively minimal, consumption associated with the project would not be wasteful or inefficient during construction. Additionally, although the project would increase petroleum use during operation as a result of periodic maintenance, the use would be a small fraction of the statewide and countywide use and, due to efficiency increases, would diminish over time. Given these considerations, petroleum consumption associated with the project would not be inefficient or wasteful and impacts would be **less than significant**.

b) Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Title 24 of the California Code of Regulations contains energy efficiency standards for residential and non-residential buildings based on a state mandate to reduce California's energy demand. Specifically, Title 24 addresses a number of energy efficiency measures that impact energy used for lighting, water heating, heating, and air conditioning, including the energy impact of the building envelope such as windows, doors, skylights, wall/floor/ceiling assemblies, attics, and roofs.

Part 6 of Title 24 specifically establishes energy efficiency standards for residential and non-residential buildings constructed in the State of California in order to reduce energy demand and consumption. The project would be required to comply with Title 24, Part 6, per state regulations. In addition, Title 24, Part 11, contains voluntary and mandatory energy measures that are applicable to the project under the CALGreen Code. As discussed under the previous threshold, the project would result in a nominal increased demand for electricity, natural gas, and petroleum.

The City's Energy Action Plan outlines a goal of a 15% reduction in electricity consumption from the 2015 baseline level by the year 2020. The project would not result in an increase in long-term consumption of electricity or natural gas during operation. Similarly, the project would not interfere with the goals within the

County's ECAP to reduce energy use. Therefore, the project would not interfere with the City and County's goal to reduce energy consumption.

Because the project would comply with Title 24, Part 6 and Part 11, would be consistent with the City's Energy Action Plan and the County's ECAP, no conflict with existing energy standards and regulations would occur. Therefore, impacts would be **less than significant**.

4.2.5 Level of Significance Prior to Mitigation

As discussed above, no significant direct or indirect impacts related to energy would result from the proposed project.

4.2.6 Conclusion

Impacts would be less than significant.

4.3 Mineral Resources

This section describes the existing mineral resources of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the project.

4.3.1 Existing Conditions

4.3.1.1 Minerals

Mineral resource mapping from the California Department of Conservation (DOC) Geologic Survey classifies the project site and surrounding lands as Mineral Resource Zone 3 (MRZ-3) (DOC 1989). MRZ-3 designates areas containing mineral deposits whose significance cannot be evaluated from available data. The City's General Plan/Local Coastal Land Use Plan states that there are no non-oil mineral resources of substantial quantities within the City's planning area (City of Carpinteria 2003). The County's Comprehensive Plan identifies mineral resources within the County and does not indicate the presence of mineral resources in the portion of the project site in unincorporated Santa Barbara County (County of Santa Barbara 2010).

4.3.1.2 Oil and Gas

Oil is the only substantial mineral resource known to be present within the general vicinity of the project site. Oil-related activities in the Carpinteria region consist of offshore drilling and extraction platforms, onshore oil storage facilities, a product transportation terminal, and a natural gas processing plant (City of Carpinteria 2003). There are ten oil platforms currently off the coast of Carpinteria, only three (Platforms Grace, Gail, and Habitat) pipe extracted oil and natural resources to facilities within the City of Carpinteria (City of Carpinteria 2003). Platform Grace ceased production in 1998. The Carpinteria Processing Facility is located approximately 1.2 miles west of the western end of the proposed project. The facility includes a crude oil storage tank, pipeline shipping pumps, metering skids, a gas compression plant, a natural gas liquids recovery plant, offices, tanks, maintenance shops and various equipment and facilities. The Carpinteria Processing Facility is in the initial stages of decommissioning,, as are one or more of the platforms that pipe oil and gas to the Carpinteria Processing Facility.

According to the California Department of Conservation, Division of Oil, Gas, and Geothermal Resources, there are no active or abandoned oil wells within the project site (DOGGR 2021). An abandoned oil well does exist within the Rincon Beach County Park property, outside of the project limits.

4.3.2 Relevant Plans, Policies, and Ordinances

4.3.2.1 Federal

There are no federal regulations related to mineral resources that apply to the proposed project.

4.3.2.2 State

Department of Conservation, Division of Oil, Gas, and Geothermal Resources

Division of Oil, Gas, and Geothermal Resources (DOGGR) is responsible for supervising the drilling, operation, maintenance, plugging, and abandonment of oil, gas, and geothermal wells. DOGGR's regulatory program promotes the sensitive development of oil, natural gas, and geothermal resources in California through sound engineering practices, prevention of pollution, and implementation of public safety programs. To implement this regulatory program, DOGGR requires avoidance of building over or near plugged or abandoned oil and gas wells or requires the remediation of wells to current DOGGR standards.

All oil and gas wells drilled and constructed in California must adhere to strict requirements. These requirements include general laws and regulations regarding the protection of underground and surface water, and specific regulations regarding the integrity of the well casing, the cement used to secure the well casing inside the bore hole, and the cement and equipment used to seal off the well from underground zones bearing fresh water and other hydrocarbon resources. (See California Public Resources (CPR) Code sections 3106, 3203, 3211, 3220, 3222, 3224, 3255; Title 14 of the California Code of Regulations, sections 1722.2, 1722.3, 1722.4, etc.). In addition, the DOGGR requires avoidance of building over or near plugged or abandoned oil and gas wells or requires the remediation of wells to current DOGGR standards. DOGGR also has the authority under the CCR to adopt field rules for oil and gas pools or zones in a field when sufficient geologic and engineering data is available from previous drilling operations. The administrative boundaries of each pool or zone for which field rules have been adopted and geologic and engineering information is available to accurately describe subsurface conditions are designated through a ministerial process by DOGGR. Applicable field rules identify down hole conditions and well construction information that oil and gas operators should consider when drilling and completing onshore oil and gas wells. In addition to DOGGR facilities regulations, operators that have facilities in designated areas must have Spill Prevention, Control and Countermeasure Plans per U.S. Environmental Protection Agency (EPA) requirements.

Surface Mining and Reclamation Act of 1975

The mineral resources addressed in this report pertain to those resources that are classified under the State Mining and Reclamation Act of 1975 (SMARA). SMARA mandated the initiation of mineral land classification by the State Geologist in order to help identify and protect mineral resources in areas within the State subject to urban expansion and other irreversible land uses that would preclude mineral extraction. SMARA also allowed the designation of lands containing mineral deposits of regional or statewide significance. SMARA was amended (1980) to provide for the classification of nonurban areas subject to land-use threats incompatible with mining. The classification of land within California takes place according to a priority list that was established by the State Mining and Geology Board (SMGB) in 1982, or when SMGB is petitioned to classify a specific area. The State Geologist's SMARA classification activities are carried out under a single program for urban and nonurban areas of the state.

Mineral lands are mapped using the California Mineral Land Classification System according to jurisdictional boundaries, mapping all mineral commodities at one time in the area, including aggregate, common clay, and dimensions stone. Priority is given to areas where future mineral resource extraction could be precluded by incompatible land use or to mineral resources likely to be mined during the 50-year period following their classification.

SMGB established MRZs to designate lands that contain mineral deposits. Accordingly, the MRZ classification system is used to evaluate an area's mineral resources pursuant to SMARA. A "resource" is a concentration of naturally occurring solid, liquid, or gaseous material in such form and amount that economic extraction of a

commodity from the concentrations is currently potentially feasible. A "reserve" is that part of the resource base that could be economically extracted or produced within the foreseeable future. For any given mineral resource, an area may be classified as MRZ-1, MRZ-2, MRZ-3, or MRZ-4, as follows:

MRZ-1: Areas where the available geologic information indicates that no significant mineral deposits are present, or where it is judged that no significant likelihood exists for their presence.

MRZ-2: Areas where the available geologic information indicates that significant mineral deposits are present, or that there is likelihood for the presence of significant mineral deposits.

MRZ-3: Areas where the available geologic information indicates that mineral deposits are likely to exist, the significance of which cannot be determined from available data ·

MRZ-4: Areas where available geologic information is inadequate for assignment into any other MRZ, or where there is not enough information available to determine the presence or absence of mineral deposits.

The MRZ classifications are applied based on available geologic information and on geologic appraisal of the mineral resource potential of the land, including geologic mapping and other information on surface exposures, drilling records, and mine data; and on socioeconomic factors such as market conditions and urban development patterns.

Special Publication 51

Special Publication 51 prepared by SMGB in cooperation with the Office of Mine Reclamation and the California Geological Survey, contains California Surface Mining and Reclamation Policies and Procedures.

California Geological Survey (Formerly California Division of Mines and Geology)

The California Geological Survey (CGS, formerly the California Division of Mines and Geology within the State Department of Conservation) has responsibility for identifying and assisting in the utilization of mineral deposits, and identifying geological hazards, including fault locations.

4.3.2.3 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan

The Open Space, Recreation and Conservation Element of the General Plan/Local Coastal Land Use Plan identifies oil as the only known mineral resource in the City and also notes: "On-shore oil and gas facilities in Carpinteria are largely defunct and are now incompatible with residential neighborhoods that are established" (City of Carpinteria 2003). General Plan/Local Coastal Land Use Plan objectives and policies which could be considered relevant to the proposed project include the following.

Objective OSC-12: Maintain an understanding of the oil industry and its exploration objectives.

OSC-12a. Remain informed of activities in the oil industry, both plans and regulations.

OSC-12b. Work with the oil and gas plant operator(s) to remove obsolete equipment, to upgrade all facilities to current safety standards, and to consolidate activities in order to eliminate redundancy.

County of Santa Barbara Coastal Land Use Plan

The County's Coastal Land Use Plan (County of Santa Barbara 2019*)* applies to coastal areas of the County, including the portions of the project site located within the County. There are no policies in the County's Coastal Land Use Plan related to mineral resources that would be relevant to the proposed project.

4.3.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to mineral resources are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to mineral resources would occur if the project would:

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.
c) Result in cumulatively considerable impacts relating to mineral resources.

4.3.4 Impact Analysis

a) Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

While California DOC designated the vicinity surrounding and including the project site as MRZ-3, indicating that the significance of mineral resources could not be evaluated from available data (DOC 1989), there is no evidence of mineral extraction activities having occurred within the project site. Also, within the project site, there are no active or abandoned oil wells (DOGGR 2021). In addition, no mineral resources are identified to exist in the project site or vicinity (although offshore oil platforms are present) in local planning documents, including the Carpinteria General Plan/Local Coastal Land Use Plan and County of Santa Barbara Comprehensive Plan. Hence, construction and operation of the proposed project would not result in the loss of availability of mineral or oil resources that have been identified as valuable at the regional or state level. **No impacts** would occur, and no mitigations are required.

b) Would the project result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

The California DOC designated the vicinity surrounding and including the project site as MRZ-3 (DOC 1989); however, the proposed trail occurs within a corridor that has supported transportation facilities (i.e., highway and railroad) spanning more than a century, in which substantial topographic modification has occurred to accommodate existing and previous transportation alignments. As a result, mineral extraction (including oil) has not been compatible with transportation activities within the project corridor and has not occurred to date. The project site is also designated for open space and recreational uses (City of Carpinteria 2003; County of Santa Barbara 2010), with which future mineral extraction activities would be incompatible. Oil wells exist on offshore platforms in the region, but there are no facilities associated with the platforms that are located within the project site. Finally, no mineral resources are identified to exist in the project site or vicinity in local planning documents, including the Carpinteria General Plan/Local Coastal Land Use Plan and County of Santa Barbara

Comprehensive Plan. The proposed project would therefore not result in the loss of availability of known mineral resources as delineated on a local land use plan. **No impacts** would occur, and no mitigations are required.

c) Would the project result in cumulatively considerable impacts relating to mineral resources?

Cumulative development throughout the Carpinteria Valley could incrementally contribute to the loss of availability of mineral resources, through conversion of undeveloped land and limitations on areas available for mineral extraction and via consumption of mineral resources during the construction process. However, the proposed project would have no impacts on the availability of mineral resources. As such, the proposed project would not contribute to any potentially significant cumulative impacts upon mineral resources.

4.3.5 Level of Significance Prior to Mitigation

As discussed above, no impacts related to mineral resources would result from the proposed project.

4.3.6 Conclusion

Mineral resources including oil have not been identified to be present within the project site. Therefore, no impacts on mineral resources would occur from the proposed project.

INTENTIONALLY LEFT BLANK

4.4 Population and Housing

This section describes the existing population and housing of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the project.

4.4.1 Existing Conditions

The proposed project would be located within the City of Carpinteria (City), and within the County of Santa Barbara (County). The U.S. Census Bureau estimates that the City had a population of 13,385 residents in 2019 (U.S. Census Bureau 2020). Projected residential buildout within the City is 6,321 residential units, with the majority of growth in attached single-family homes and multifamily developments of varying size. Per the City's General Plan/Local Coastal Land Use Plan, the City is near buildout due to land use constraints (City of Carpinteria 2003). Santa Barbara County Association of Governments (SBCAG) projects the City's population will reach its maximum of 14,700 people by 2045, with 5-year population growth slowing to 1% or less by 2030. SBCAG also projects a smaller growth in households for the City, with households projected to number 5,700 units by 2050 (SBCAG 2019).

The portion of the project site within the City has a General Plan/Coastal Land Use Plan land use designation of Visitor-Serving Commercial (City of Carpinteria 2003) and has been zoned for Resort Zone District use (City of Carpinteria 2016). The portion of the project within the County of Santa Barbara is designated as Other Recreation/Open Space and is zoned Transportation Corridor and Recreation (County of Santa Barbara 2020). No housing is currently present on the project site, nor is the site designated for residential uses.

4.4.2 Relevant Plans, Policies, and Ordinances

4.4.2.1 Federal

There are no federal regulations associated with population and housing that are relevant to the proposed project.

4.4.2.2 State

There are no state regulations associated with population and housing that are relevant to the proposed project.

4.4.2.3 Local

Regional Housing Needs Assessment

The state requires communities develop a Regional Housing Needs Allocation (RHNA) Plan to be incorporated into General Plan Housing Elements by cities and counties in the region. Within Santa Barbara County, the RHNA Plan is developed by SBCAG. The RHNA Plan evaluates projected population growth and jobs, affordability of housing, and other factors that affect housing problems to identify housing needs and allocate a share of the region's housing need to jurisdictions within the RHNA Plan. Housing needs are subdivided into household income levels to help jurisdictions plan for the appropriate number and mix of housing affordable to various income levels. Jurisdictions use the RHNA Plan when updating their General Plan Housing Elements to assure zoning and land is available to accommodate their projected housing needs. The RHNA projections for Carpinteria have been incorporated into the 2015-2023 Housing Element of the City's General Plan/Local Coastal Land Use Plan (City of Carpinteria 2014).

City of Carpinteria General Plan/Local Coastal Land Use Plan

The City of Carpinteria's General Plan/Local Coastal Land Use Plan Housing Element is updated every 8 years and plans for existing and future housing needs in the community in compliance with the RHNA Plan. The 2015-2023 Housing Element includes the following goals and policies relevant to the proposed project organized by program category:

Program Category 1 Make Sites Available to Accommodate the RHNA

Goal Attain additions to the housing supply that meet the housing needs of all economic segments

Goal Maintain a jobs-housing balance or ratio within the 0.75 to 1.25 range suggested by SBCAG

Policy Adequate Sites: Provide sufficient sites to the General Plan/Coastal Plan and zoning map to meet the housing needs allocated to the City by the RHNA Plan

Policy Public Services and Facilities: Ensure that public services and facilities have the capacity to support the need for the new residential development allocated to the City by the RHNA Plan.

The City is currently updating their General Plan/Local Coastal Land Use Plan. All elements of the General Plan/Local Coastal Land Use Plan, aside from the Housing Element, which was updated in 2011, will be revised during the General Plan/Local Coastal Land Use Plan update. The updated plan is expected to become available in 2021.

County of Santa Barbara Comprehensive Plan

The County of Santa Barbara's Comprehensive Plan Housing Element includes goals and policies to address housing development and needs in the unincorporated County. The portion of the County within the project site is not zoned for residential use; therefore, Housing Element policies are not relevant to the proposed project.

County of Santa Barbara Coastal Land Use Plan

The County of Santa Barbara's Coastal Land Use Plan includes policies to address housing development in the coastal zone in the County. The portion of the County within the project site is not zoned for housing; therefore, housing policies in the Coastal Land Use Plan are not relevant to the proposed project.

4.4.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to population and housing are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to population and housing would occur if the project would:

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.
c) Result in cumulatively considerable impacts relating to population and housing.

4.4.4 Impact Analysis

a) Would the project Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

The proposed project is not anticipated to result in an increase in population. The proposed project would generate short-term employment opportunities during construction of the proposed trail. Given the temporary duration of project construction of approximately 24 months and availability of construction workers within Santa Barbara and Ventura Counties, project construction is unlikely to generate a significant increase in population and/or new development that could result in a significant impact to the environment. The proposed trail maintenance would be performed by existing City or County parks and recreation/public works maintenance staff. There would be no increase in part or full-time staff equivalents. Therefore, the project would not induce substantial unplanned population growth in an area, either directly or indirectly, and **no impacts** would occur.

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

As discussed in Section 4.5.2, no housing is currently present on the project site, nor is the site designated for residential uses. Therefore, the proposed project would not include the demolition of existing housing, construction of new housing, or displacement of people, and **no impacts** would occur.

c) Would the project result in cumulatively considerable impacts relating to population and housing?

As discussed above, construction of the project is not anticipated to result in the creation of permanent employment opportunities in the community or the attraction of new residents. In addition, the trail construction would not remove any existing residences and is not located on land zoned for residential uses. Consequently, the project would not contribute to cumulatively considerable impacts relating to population and housing, resulting in **no impacts.**

4.4.5 Level of Significance Prior to Mitigation

As discussed above, no significant impacts related to population and housing would result from the proposed project.

4.4.6 Conclusion

No impact to population or housing would occur.

INTENTIONALLY LEFT BLANK

4.5 Public Services

This section describes the existing public services of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the project.

4.5.1 Existing Conditions

Fire Protection

Carpinteria is serviced by the Carpinteria-Summerland Fire Protection District (CSFPD). The CSFPD covers 40 square miles along the Pacific Ocean including land area within the City of Carpinteria and the County of Santa Barbara. The CSFPD is bordered on the east by the Santa Barbara/Ventura County line and to the west by the community of Montecito. The CSFPD provides the Carpinteria Valley with adequate staff and facilities to serve the area in the event of a fire or emergency. There are currently two fire stations that serve the area: one in the City (Walnut Avenue) and one in Summerland. Current response times range from 3 minutes to 5 minutes. All fire fighters (full-time and reserves) have EMT-1 training (City of Carpinteria 2003).

Wildland or brush fires are defined as those fires occurring in undeveloped areas commonly covered by heavy vegetation, typically in the hills and canyons. The Santa Barbara County Fire Department generally responds to wildland fires outside the urban limit zone defined by the CSFPD (City of Carpinteria 2003).

Police Protection

Law enforcement services within the incorporated City of Carpinteria are provided by the Santa Barbara County Sheriff's Department.

Schools

Schools within the Carpinteria Planning Area are administered by the Carpinteria Unified School District, which includes Aliso Elementary School, Canalino Elementary School and Canalino Preschool, Carpinteria High School, Carpinteria Middle School, Carpinteria Family School, Carpinteria Children's Project at Main, Rincon High School and Summerland Elementary School (CUSD 2019).

Parks

Carpinteria has approximately 97.96 acres of City parks within the City boundary, administered and maintained by the Carpinteria Parks & Recreation Department. Carpinteria State Beach is also within the City boundary, which is operated and maintained by the California Department of Parks and Recreation. Various County parks in the area include Rincon Beach County Park and Toro Canyon Park. Rincon State Beach Park is located just east of Rincon Beach County Park.

4.5.2 Relevant Plans, Policies, and Ordinances

4.5.2.1 Federal

There are no federal regulations that pertain to the local delivery of public services including fire and police protection, public education, or parks and recreation.

4.5.2.2 State

California Penal Code

All law enforcement agencies within the State of California are organized and operated in accordance with the applicable provisions of the California Penal Code. This code sets forth the authority, rules of conduct, and training for peace officers. Under state law, all sworn municipal and county officers are State Peace Officers.

California Department of Forestry and Fire Protection: State Responsibility Areas

Open space and undeveloped areas identified as having a fire hazard and not falling under federal jurisdiction, are referred to as State Responsibility Areas (SRAs) because the state has the primary financial responsibility of preventing and suppressing fires within such areas. The agency responsible for suppressing fires in SRAs is CAL FIRE. Local fire agencies are responsible for suppressing fires in private property within City limits. Legislative mandates passed in 1981 (SB 81) and 1982 (SB 1916) that became effective on July 1, 1986, required CAL FIRE to develop and implement a system to rank the fire hazards in California. Areas were rated as moderate, high or very high based primarily on fuel types. Thirteen different fuel types were considered using the 7.5-minute quadrangle maps by the US Geological Survey as base maps. SRAs include all lands regardless of ownership, except for cities and federal lands. The project site is within the City of Carpinteria and County of Santa Barbara, and no part of the project site is included in the CalFire SRA maps.

California Code of Regulations Title 24, Part 2, and Part 9

The 2016 California Building Standards Code was published July 1, 2016, with an effective date of January 1, 2017. Part 2 of Title 24 of the California Code of Regulations (CCR) refers to the California Building Code, which contains regulations and general construction building standards of state agencies, including administrative, fire, and life safety, and field inspection provisions. Part 2 was updated in 2017 to reflect changes in the base document from the Uniform Building Code to the International Building Code. Part 9 refers to the California Fire Code, which contains fire-safety-related building standards referenced in other parts of Title 24. This code is preassembled with the 2000 Uniform Fire Code of the Western Fire Chiefs Association. This code was revised in January 2017 with a change in the base model/consensus code from the Uniform Fire Code series to the International Fire Code.

California Fire Code

The California Fire Code and Office of the State Fire Marshal provides regulations and guidance for local agencies in the development and enforcement of fire safety standards. The California Fire Code also establishes minimum requirements that would provide a reasonable degree of safety from fire, panic, and explosion (24 CCR 9).

Senate Bill 50 School Financing and Mitigation Requirements

Currently, school financing and developer mitigation obligations are governed by SB 50 (Government Code Section 65995 et seq.), which was passed in 1998 and has been amended several times since then. SB 50 was enacted to provide comprehensive school facility finance and mitigation reform, which assists in providing school facilities to serve students generated by new development projects. SB 50 allows school districts to collect school facilities fees from developers of new residential and commercial/industrial building space.

SB 50 substantially revamped prior statutory and regulatory methods of providing state monies for school construction by eliminating the apportionment of state funds method used by the State Allocation Board (SAB) under the old system originally enacted as part of the Leroy F. Greene State School Building Lease Purchase - Law of 1976 and replacing it with the Leroy F. Greene School Facilities Act of 1998. SB 50, among other things, established a new state program by which the SAB provides state per-pupil grant funding for new school facilities construction and reconstruction, as well as modernization of existing facilities. An important objective of SB 50 was to provide, on a one-time basis, a baseline analysis of unhoused students and existing capacity in a local school district's school facilities to determine eligibility for new state school construction funding. In addition to providing 50% of the state funding and construction costs, which include construction cost containment mechanisms through limitations on the state per-pupil grant amounts (grant amounts are adjusted annually by the SAB to reflect construction cost changes), the state also provides funding for 50% of the site acquisition and site development costs for a school site.

SB 50 specifically provides that it is the exclusive method for financing school facilities, and provides the methods for mitigating environmental effects related to the adequacy of school facilities. Nevertheless, school districts and developers may enter into separate mitigation agreements to provide enhanced mitigation measures beyond the requirements of SB 50. SB 50 establishes three levels of developer fees that can be imposed upon new development that are deemed to be "full and complete facilities mitigation." The school fees that are charged towards new residential development are state mandated and beyond the City's control.

Comprehensive School Safety Plan

It is the intent of the Comprehensive School Safety Plan that all California public schools that offer kindergarten and/or grades 1 through 12 are inclusive and are operated by school districts, and develop a comprehensive school safety plan that addresses the safety concerns identified through a systematic planning process. The schools must work in cooperation with local law enforcement agencies, community leaders, parents, pupils, teachers, administrators, and other persons who may be interested in the prevention of campus crime and violence (California Education Code, Title 1, Section 32280).

Quimby Act

Cities and counties have been authorized since the passage of the 1975 Quimby Act (California Government Code, Section 66477) to pass ordinances requiring that developers set aside land, donate conservation easements, or pay fees for park improvements. Revenues generated through the Quimby Act cannot be used for the operation and maintenance of park facilities. The goal of the Quimby Act is to require developers to help mitigate the impacts of property improvements. The act gives authority for passage of land dedication ordinances only to cities and counties. Special districts must work with cities and/or counties to receive parkland dedication and/or in-lieu fees. The fees must be paid and land conveyed directly to the local public agencies that provide park and recreation services communitywide. Cities and counties with a high ratio of park space to inhabitants

can set a standard of up to five acres per 1,000 people for new development. Cities and counties with a lower ratio can only require the provision of up to three aces of park space per 1,000 people. The calculation of a city or county's park space to population ratio is based on a comparison of the population count of the last federal census to the amount of city/county-owned parkland.

4.5.2.3 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan

The Public Facilities and Services Element of the General Plan/Local Coastal Land Use Plan includes goals, objectives, and policies related to providing essential public services, implementing regulations in the interest of the public health and safety, and providing for the general welfare of the community. Objectives and policies specifically related to the proposed project include (City of Carpinteria 2003):

Objective PF-3: The City shall strive to maintain the best possible police and fire safety services for the community.

- **PF-3a.** The City shall endeavor to monitor relevant statistics and enforcement criteria to assure adequate police service.
- **PF-3b.** The City shall begin evaluation of potential programs that can resolve seasonal tourist-related police service demands.
- **PF-3c.** The City shall cooperate with the fire district for the purpose of determining district needs and to provide development mitigations as indicated by the study.
- **PF-3d.** The City shall strive to increase district/City communication by initiating development review procedures that incorporate district interaction at the earliest times possible.

Objective PF-4 To assist the school district in continued provision of high-quality educational opportunities for all of the community's youth.

- **PF4a** To continue efforts to cooperatively resolve service demands for educational facilities.
- **PF4b** To encourage school district input to new development proposals by improved review procedures.
- **PF4c** The City will cooperate with the Carpinteria Unified School District to ensure sufficient capacity for increases in student population caused by future development projects.

Objective PF-5 To provide a high quality and broad range of public services, facilities and utilities to meet the needs of all present and future residents of the Carpinteria Planning Area.

- **PF-5b.** The City will require proposed new developments to pay a fair share of the cost of needed public facilities and services. Further, in areas of the city designated for nonresidential use but where residential use may be permitted, the City shall monitor total residential development and report annually to the School, Fire, Water and Sanitary districts to permit proper facilities planning by these special districts.
- **PF-5c.** The City will ensure that new development will not adversely impact services and facilities provided to existing development.
- **PF-5d.** Detailed master plans will be prepared for major facilities and service systems.

PF-5e. The City will improve and extend services and facilities to the extent possible, within the limits of available funding.

PF-5f. Carpinteria will focus City funds on service and facilities improvements to meet existing needs prior to committing funds to the extension of services and facilities to new areas.

PF-5g. The City will coordinate with the appropriate agencies/districts and plan for public facilities to be located and sized to discourage expansion of urban development beyond the transition area of the urban/rural boundary. New or expanded public works facilities shall be designed and limited to accommodate needs generated by development or uses allowed consistent with the provisions of the City's Local Coastal Program.

Santa Barbara County Coastal Land Use Plan

The Santa Barbara County Coastal Land Use Plan (County of Santa Barbara 2019) includes goals, objectives, and policies related to ensuring the provision of adequate essential public services for proposed development, implementing regulations in the interest of the public health and safety, and providing for the general welfare of the community. Policies specifically related to the proposed project include:

Policy 2-6: Prior to issuance of a development permit, the County shall make the finding, based on information provided by environmental documents, staff analysis, and the applicant, that adequate public or private services and resources (i.e., water, sewer ads, etc.) are available to serve the proposed development. The applicant shall assume full responsibility for costs incurred in service extensions or improvements that are required as a result of the proposed project. Lack of available public or private services or resources shall be grounds for denial of the project or reduction in the density otherwise indicated in the land use plan. Where an affordable housing project is proposed pursuant to the Affordable Housing Overlay regulations, special needs housing or other affordable housing projects which include at least 50% of the total number of units for affordable housing or 30% of the total number of units affordable at the very low income level are to be served by entities that require can-and-will-serve letters, such projects shall be presumed to be consistent with the water and sewer service requirements of this policy if the project has, or is conditioned to obtain all necessary can-and-will-serve letters at the time of final map recordation, or if no map prior to issuance of land use permits.

Santa Barbara County Office of Emergency Management and Emergency Management Plan

The Santa Barbara County Office of Emergency Management (SBCOEM) is responsible for planning and coordination of the Santa Barbara Operational Area, which includes the cities of Buellton, Carpinteria, Goleta, Guadalupe, Lompoc, Santa Barbara, Santa Maria, and Solvang. The SBCOEM acts as a liaison between these cities; special districts including the SBCAPCD, fire districts, sanitary districts, school districts, vector control districts, and water districts; and volunteer organizations such as the American Red Cross. The SBCOEM also coordinates with adjoining offices of emergency services in Ventura and San Luis Obispo counties through several annual meetings. The Santa Barbara County Emergency Management Plan was developed for use by the County and the cities within the Santa Barbara Operational Area (County of Santa Barbara 2013). The Emergency Management Plan addresses the planned response to extraordinary emergency situations associated with natural disasters, technological incidents, and national security emergencies.

4.5.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to public services are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to public services would occur if the project would:

a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:
   i. Fire protection?
   ii. Police protection?
   iii. Schools?
   iv. Parks?
   v. Other public facilities?

b) Result in cumulatively considerable impacts relating to public services.

4.5.4 Impact Analysis

The following analysis of potential project impacts is based upon the above thresholds of significance.

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

Fire Protection

According to the City of Carpinteria's General Plan/Coastal Plan Fire Hazards Zones Map, the project site is located within a moderate fire hazard area (City of Carpinteria 2003). Carpinteria – Summerland Fire Protection District Fire Station #1, located at 911 Walnut Avenue, approximately 2 miles west of the project site, is the closest fire station to the project site that has the primary responsibility for responding to emergencies (CSFPD 2019). The proposed project would not involve the construction of buildings or introduce substantial numbers of people into the area. The proposed project would also not require the construction of new fire facilities to accommodate the proposed trail and amenities. Further, the project may help reduce the fire danger from the current setting as proposed native plantings, vegetation control, and fire-resistant project materials would be less prone to fire danger than the currently dry and unmaintained vegetation sources on-site, and the paved trail would accommodate light-duty firefighting equipment access to trail portions below the UPRR alignment from the Rincon Beach County Park and to portions above the UPRR alignment from the connection to the Carpinteria Avenue Eastern terminus, resulting in **less than significant impacts** to fire protection services.

Police Protection

The proposed project is not anticipated to require the construction of new police facilities. The Santa Barbara County Sheriff's Department, Carpinteria Station, is located at City Hall at 5775 Carpinteria Avenue,

approximately 1.3 miles west of the project site (Santa Barbara County Sheriff's Department 2019). The proposed project would not result in the construction of new buildings that could present unique challenges for police protection services on-site or result in an increase in population that would warrant the construction of new facilities to provide adequate police protection services. The trail would permit more convenient patrol of the project area by Park Rangers and County Sheriff personnel, resulting in a potential marginal benefit to police protection, and resulting in **less than significant impacts** to police protection services.

Schools

The proposed project is not anticipated to generate an increase in population that would have an adverse effect on existing schools or warrant the construction of new or expanded schools. Therefore, there would be **no impact** of the project related to the need for development of new school facilities.

Parks

The proposed project is not anticipated to generate an increase in population that would warrant the construction of additional new parks. The proposed project would provide a safe connection from Carpinteria Avenue to Rincon Beach County Park, thereby increasing the ease of pedestrian and bicycle access to the Rincon Beach County Park, which is an objective of the proposed project. As the project would facilitate safe access to the Rincon Beach County Park, it would be anticipated to increase recreational use of the Rincon Beach County Park and the Carpinteria Trail system. However, the increased use is not anticipated to result in the degradation of Rincon Beach County Park, other nearby parks, trails, or associated recreational facilities and amenities. Also, the Rincon Trail would enhance access between the existing Rincon Point residential community and the newly established Rincon Bluffs preserve, benefitting the Rincon Point population as well as other Ventura County residents that would be able to walk or bike to the Rincon Bluffs preserve area. Lastly, the Rincon Trail itself represents a recreation resource for biking and hiking, with opportunities including enjoyment of the natural scenery (refer also to Section 3.10, Recreation). The proposed project would require additional and occasional trail maintenance. Initially, the landscape areas would require weed management and irrigation during the dry months. Park design attributes such as the use of native plants would help to reduce costs associated with watering and plant care. Annual estimated maintenance costs are expected to be minimal. Therefore, the project would result in **less than significant impacts** to park resources.

Other Public Facilities

The proposed project is not anticipated to generate an increase in population that would increase the demand for any other public facilities. There would be **no impact.**

b) Would the project result in cumulatively considerable impacts relating to public services?

Cumulative development throughout the Carpinteria Valley would incrementally contribute to public service impacts. However, current and future projects proposed in the City of Carpinteria and County of Santa Barbara will be required be consistent with applicable General Plan/Coastal Plan policies, and to pay pertinent Development Impact Fees (DIFs) and all special district fees. The proposed project would not result in significant impacts to any public services. As such, the proposed project would not result in a considerable contribution to any potentially significant cumulative impacts upon public services.

4.5.5 Level of Significance Prior to Mitigation

As discussed above, no significant impacts related to public services would result from the proposed project.

4.5.6 Conclusion

The proposed project would neither construct structures nor place combustible materials on the site, thereby avoiding any increases in the demand for police or fire protection services. The project would not lead to an increase in local population that could increase demands for school or parks resources. The construction and operation of the trail would also not place additional demands on other public facilities. As such the project would have no impacts on public services and no mitigation would be required or recommended.

4.6 Wildfire

This section describes the existing wildfire conditions of the proposed Carpinteria Rincon Trail Project (project) site and vicinity, identifies associated regulatory requirements, and evaluates potential impacts related to implementation of the project.

4.6.1 Existing Conditions

Wildland or brush fires are defined as those fires occurring in undeveloped areas commonly covered by heavy vegetation, typically in the hills and canyons. The project site may be characterized as a ridgeline and associated slopes, supporting areas of native vegetation as well as bare ground. While the native vegetation within the project area could become involved in a wildland fire, the project site is somewhat isolated from ignition sources by virtue of the presence of the U.S. Highway 101 corridor along the northern side and the Pacific Ocean along the southern side. These features would also act to limit the spread of a wildland fire originating within the project area or immediately adjacent urban areas to the west (City of Carpinteria) or east (Rincon Point).

With respect to fire protection resources, the Carpinteria Planning Area is serviced by the Carpinteria- Summerland Fire Protection District (CSFPD). The CSFPD covers 40 square miles along the Pacific Ocean including land area within the City and the County. The CSFPD is bordered on the east by the Santa Barbara/Ventura County line and to the west by the community of Montecito. There are currently two fire stations that serve the area: one in the City (Walnut Avenue) and one in Summerland. Current response times range from 3 minutes to 5 minutes. All fire fighters (full-time and reserves) have EMT-1 training (City of Carpinteria 2003). The Santa Barbara County Fire Department generally responds to wildland fires outside the urban limits associated with Cities within the County, and would therefore participate in responding to a wildfire incident involving portions of the trail within unincorporated County lands.

4.6.2 Relevant Plans, Policies, and Ordinances

4.6.2.1 Federal

Healthy Forests Restoration Act

The 2003 Healthy Forests Restoration Act gives incentives for communities to engage in comprehensive forest planning and prioritization. This legislation includes statutory incentives for the U.S. Forest Service and the Bureau of Land Management to give consideration to the priorities of local communities as they develop and implement forest management and hazardous fuel reduction priorities (USFS 2021).

National Fire Protection Association Codes, Standards, Practices, and Guides

National Fire Protection Association codes, standards, recommended practices, and guides are developed through a consensus standards development process approved by the American National Standards Institute. This process brings together professionals representing varied viewpoints and interests to achieve consensus on fire and other safety issues. National Fire Protection Association standards are recommended guidelines and nationally accepted good practices in fire protection but are not laws or codes unless adopted as such or referenced as such by the California Fire Code or the local fire agency.

Federal Wildland Fire Management Policy

The Federal Wildland Fire Management Policy was developed in 1995, updated in 2001, and again in 2009, by the National Wildfire Coordinating Group, a federal multi-agency group that establishes consistent and coordinated fire management policy across multiple federal jurisdictions (USFS et al. 2009). An important component of the Federal Wildland Fire Management Policy is the acknowledgement of the essential role of fire in maintaining natural ecosystems. The Federal Wildland Fire Management Policy and its implementation are founded on the following guiding principles:

- Firefighter and public safety are the first priorities in every fire management activity.
- The role of wildland fire as an essential ecological process and natural change agent will be incorporated into the planning process.
- Fire management plans, programs, and activities support land and resource management plans and their implementation.
- Sound risk management is a foundation for all fire management activities.
- Fire management programs and activities are economically viable, based upon values to be protected, costs, and land and resource management objectives.
- Fire management plans and activities are based upon the best available science.
- Fire management plans and activities incorporate public health and environmental quality considerations.
- Federal, state, tribal, local, interagency, and international coordination and cooperation are essential.
- Standardization of policies and procedures among federal agencies is an ongoing objective.

National Fire Plan

The National Fire Plan was a presidential directive in 2000 as a response to severe wildland fires that had burned throughout the United States. The National Fire Plan focuses on reducing fire impacts on rural communities and providing assurance for sufficient firefighting capacity in the future. The plan addresses five key points: Firefighting, Rehabilitation, Hazardous Fuels Reduction, Community Assistance, and Accountability. The plan continues to provide invaluable technical, financial, and resource guidance and support for wildland fire management across the United States. The U.S. Forest Service and the Department of the Interior are working to successfully implement the key points outlined in the plan (USFS 2019).

International Fire Code

Created by the International Code Council, the International Fire Code addresses a wide array of conditions hazardous to life and property including fire, explosions, and hazardous materials handling or usage (although not a federal regulation, but rather the product of the International Code Council). The International Fire Code places an emphasis on prescriptive and performance-based approaches to fire prevention and fire protection systems. Updated every 3 years, the International Fire Code uses a hazards classification system to determine the appropriate measures to be incorporated in order to protect life and property (often times these measures include construction standards and specialized equipment). The International Fire Code uses a permit system (based on hazard classification) to ensure that required measures are instituted.

International Wildland-Urban Interface Code

The International Wildland–Urban Interface Code is published by the International Fire Code and is a model code addressing wildfire issues.

4.6.2.2 State

California Code of Regulations

Title 14 Natural Resources

Title 14, Division 1.5, Chapter 7, Subchapter 3, Fire Hazard, sets forth requirements for defensible space if the distances specified above cannot be met. For example, options that have similar practical effects include noncombustible block walls or fences, 5 feet of noncombustible material horizontally around the structure, hardscape landscaping or reduced exposed windows on the side of the structure with a less-than-30-foot setback, or additional structure hardening such as those required in the California Building Code (CBC), California Code of Regulations Title 24, Part 2, Chapter 7A.

Title 24 California Building Standards Code

California Building Code

Part 2 of Title 24 contains the CBC. Chapter 7A of the CBC regulates to building materials, systems, and/or assemblies used in the exterior design and construction of new buildings located within a WUI fire area. The purpose of this chapter is to establish minimum standards for the protection of life and property by increasing the ability of a building located in any Fire Hazard Severity Zone (FHSZ) within a State Responsibility Area or a WUI fire area to resist the intrusion of flames or burning embers projected by a vegetation fire and to contribute to a systematic reduction in conflagration losses. New buildings located in such areas must comply with the ignition-resistant construction standards outlined in CBC Chapter 7A.

California Fire Code

Chapter 9 of Title 24 contains the California Fire Code (CFC), which incorporates by adoption the International Fire Code with necessary California amendments. The purpose of this code is to establish the minimum requirements to safeguard the public health, safety, and general welfare from the hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises, and to provide safety and assistance to firefighters and emergency responders during emergency operations. Chapter 49 of the CFC contains minimum standards for development in the WUI and fire hazard areas. The CFC and Office of the State Fire Marshal provide regulations and guidance for local agencies in the development and enforcement of fire safety standards. The CFC is updated and published every 3 years by the California Building Standards Commission.

California Public Resources Code

California Public Resources Code, Section 4290, requires minimum fire safety standards related to defensible space that are applicable to residential, commercial and industrial building construction in State Responsibility Area lands and lands classified and designated as Very High FHSZs (VHFHSZs). These regulations include road standards for fire apparatus access, standards for signs identifying roads and buildings, fuel breaks and green belts, and minimum water supply requirements. It should be noted that these regulations do not supersede local regulations that equal or exceed minimum regulations required by the state.

California Public Resources Code, Section 4291, requires a reduction of fire hazards around buildings located adjacent to a mountainous area, forest-covered lands, brush-covered lands, grass-covered lands, or land that is

covered in flammable material. It is required to maintain a minimum 100 feet of vegetation management around all buildings and is the primary mechanism for conducting fire prevention activities on private property within CAL FIRE jurisdiction. Further, California Public Resources Code, Section 4291, requires the removal of dead or dying vegetative materials from the roof of a structure, and trees and shrubs must be trimmed from within 10 feet of the outlet of a chimney or stovepipe. Exemptions may apply for buildings with an exterior constructed entirely of nonflammable materials.

California Government Code

California Government Code Sections 51175 through 51189 provide guidance for classifying lands in California as fire hazard areas and requirements for management of property within those lands. CAL FIRE is responsible for classifying FHSZs based on statewide criteria and makes the information available for public review. Further, local agencies must designate, by ordinance, VHFHSZs within their jurisdiction based on the recommendations of CAL FIRE.

Section 51182 sets forth requirements for maintaining property within fire hazard areas, such as defensible space, vegetative fuels management, building materials, and standards. Defensible space consists of 100 feet of fuel modification on each side of a structure, but not beyond the property line unless findings conclude that the clearing is necessary to significantly reduce the risk of structure ignition in the event of a wildfire. Clearance on adjacent property shall only be conducted following written consent by the adjacent owner. Further, trees must be trimmed from within 10 feet of the outlet of a chimney or stovepipe; vegetation near buildings must be maintained; and roofs of structures must be cleared of vegetative materials. A local agency may exempt certain standards set forth in Section 51182 for buildings with an exterior constructed entirely of nonflammable materials and may vary the requirements associated with management of fuels surrounding the structures in such cases.

California Department of Forestry and Fire Protection

CAL FIRE is tasked with reducing wildfire-related impacts and enhancing California's resources. CAL FIRE responds to all types of emergencies including wildland fires and residential/commercial structure fires. In addition, CAL FIRE is responsible for the protection of approximately 31 million acres of private land within the state and, at the local level, is responsible for inspecting defensible space around private residences. CAL FIRE is responsible for enforcing State of California fire safety codes included in the California Code of Regulations and California Public Resources Code. California Public Resources Code 4291 states generally that any person operating any structure located on brush-covered lands or land covered with flammable material is required to maintain defensible space around the structure. California Code of Regulations Title 14 Section 1254 identifies minimum clearance requirements required around utility poles. In State Responsibility Areas within the jurisdiction of CAL FIRE, the Fire Safety Inspection Program is an important tool for community outreach and enforcement of state fire codes.

CAL FIRE also inspects utility facilities and makes recommendations regarding improvements in facility design and infrastructure. Joint inspections of facilities by CAL FIRE and the utility owner are recommended by CAL FIRE so that each entity may assess the current state of the facility and successfully implement fire prevention techniques and policies. Violations of state fire codes discovered during inspections are required to be brought into compliance with the established codes. If a CAL FIRE investigation reveals that a wildfire occurred as a result of a violation of a law or negligence, the responsible party could face criminal and/or misdemeanor charges. In cases where a violation of a law or negligence has occurred, CAL FIRE has established the Civil Cost Recovery Program, which requires parties liable for wildfires to pay for wildfire-related damages.

Fire Hazard Severity Zones

CAL FIRE mapped FHSZs in Santa Barbara County based on fuel loading, slope, fire history, weather, and other relevant factors as directed by California Public Resources Code, Sections 4201–4204, and Government Code Sections 51175–51189. FHSZs are ranked from Moderate to Very High (VHFHSZ) and are categorized for fire protection within a Federal Responsibility Area, State Responsibility Area, or Local Responsibility Area under the jurisdiction of a federal agency, CAL FIRE, or local agency, respectively.

California Strategic Fire Plan

The 2019 Strategic Fire Plan for California reflects CAL FIRE's focus on (1) fire prevention and suppression activities to protect lives, property, and ecosystem service; and (2) natural resource management to maintain the state's forests as a resilient carbon sink to meet California's climate change goals and to serve as important habitat for adaptation and mitigation. The Strategic Fire Plan for California provides a vision for a natural environment that is more fire resilient; buildings and infrastructure that are more fire resistant; and a society that is more aware of and responsive to the benefits and threats of wildland fire; all achieved through local, state, federal, tribal, and private partnerships (CAL FIRE 2019). Plan goals include the following:

1. Identify and evaluate wildland fire hazards and recognize life, property and natural resource assets at risk, including watershed, habitat, social and other values of functioning ecosystems. Facilitate the collaborative development and sharing of all analyses and data collection across all ownerships for consistency in type and kind.
2. Promote and support local land use planning processes as they relate to: (a) protection of life, property, and natural resources from risks associated with wildland fire, and (b) individual landowner objectives and responsibilities.
3. Support and participate in the collaborative development and implementation of local, county and regional plans that address fire protection and landowner objectives.
4. Increase fire prevention awareness, knowledge and actions implemented by individuals and communities to reduce human loss, property damage and impacts to natural resources from wildland fires.
5. Integrate fire and fuels management practices with landowner/land manager priorities across jurisdictions.
6. Determine the level of resources necessary to effectively identify, plan and implement fire prevention using adaptive management strategies.
7. Determine the level of fire suppression resources necessary to protect the values and assets at risk identified during planning processes.
8. Implement post-fire assessments and programs for the protection of life, property, and natural resource recovery.

California Emergency Services Act

The California Emergency Services Act was adopted to establish the state's roles and responsibilities during human-caused or natural emergencies that result in conditions of disaster and/or extreme peril to life, property, or resources of the state. This act is intended to protect health and safety by preserving the lives and property of the people of the state.

Mutual Aid Agreements

The California Disaster and Civil Defense Master Mutual Aid Agreement, as provided by the California Emergency Services Act, provides statewide mutual aid between and among local jurisdictions and the state. The statewide mutual aid system exists to ensure that adequate resources, facilities, and other supports are provided to jurisdictions whenever resources prove to be inadequate for a given situation. Each jurisdiction controls its own personnel and facilities but can give and receive help whenever needed.

4.6.2.3 Local

City of Carpinteria General Plan/Local Coastal Land Use Plan

The Public Facilities and Services Element of the General Plan/Local Coastal Land Use Plan includes goals, objectives, and policies related to providing for the general welfare of the community. Objectives and policies specifically related to the proposed project include (City of Carpinteria 2003):

Objective PF-3 The City shall strive to maintain the best possible police and fire safety services for the community.

PF-3c The City shall cooperate with the fire district for the purpose of determining district needs and to provide development mitigations as indicated by the study.

PF-3d The City shall strive to increase district/City communication by initiating development review procedures that incorporate district interaction at the earliest times possible.

The Safety Element of the General Plan/Local Coastal Land Use Plan includes goals, objectives, and policies related to achieving and maintaining public health and safety. Objectives and policies specifically related to the proposed project include (City of Carpinteria 2003):

Objective S-5 Minimize the potential risks and reduce the loss of life, property and economic and social dislocation resulting from urban and wildland fires.

S-5a All new structures must adhere to the Carpinteria-Summerland Fire Protection District Ordinance and the Santa Barbara County Fire Department Ordinances, where applicable

S-5b. All new structures, whether within or outside the urban limit zone, must adhere to the city Fire Sprinkler Ordinance.

S-5c Roads shall be installed or improved to the standards specified in the County of Santa Barbara Private Road and Driveway Standard, Section 8 of the County of Santa Barbara Municipal Code.

S-5d The City will work in conjunction with the Carpinteria Summerland Fire Protection District to adhere to, and enforce, all fire codes.

Santa Barbara County Coastal Land Use Plan

The Santa Barbara County Coastal Land Use Plan (County of Santa Barbara 2019) indicates that areas of moderate fire hazard within urban areas of the coastal zone are restricted to hilly sections of the Carpinteria Valley and Summerland. Developments within any of the hazardous zones in rural areas will be very low density and subject

to stringent building, brush clearance, access, and water storage capacity restrictions (for fire suppression purposes) by the County Fire Department and/or the U.S. Forest Service.

4.6.3 Thresholds of Significance

The significance criteria used to evaluate the project impacts to wildfire are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, if located in or near state responsibility areas or lands classified as very high fire hazard severity zones, a significant impact related to wildfire would occur if the project would:

a) Substantially impair an adopted emergency response plan or emergency evacuation plan.
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.
e) Result in cumulatively considerable impacts relating to wildfire.

4.6.4 Impact Analysis

The following analysis of potential project impacts is provided, based upon the above thresholds of significance.

a) Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

The Rincon Trail property is currently undeveloped and spans an area roughly between the eastern terminus of Carpinteria Avenue and Rincon Beach County Park. There are no developed roads within the project site, and consequently there are no evacuation routes currently extending onto the property from adjacent areas. In addition, no official evacuation routes have been designated by the County Office of Emergency Services and the Santa Barbara Operational Area Emergency Management Plan (County of Santa Barbara 2013). The 2017 Santa Barbara County Multi-Jurisdictional Hazard Mitigation Plan (County of Santa Barbara 2017) also does not provide specific emergency management plans for the vicinity of the project. Consequently, the project would have **no impact** on an adopted emergency response plan or emergency evacuation plan.

b) Would the project, due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

The project involves the creation and maintenance of a concrete trail and steel frame bridge crossing over the UPRR alignment. These are non-combustible materials that would not increase fire risk. Slopes along the trail alignment would be regraded to achieve a shallower slope angle, which would marginally decrease the potential for wildfire spread and also facilitate access for firefighters to extinguish a potential wildland fire on the property. The trail would also allow lightweight fire-fighting equipment to access all points of the trail, facilitating firefighting activities. As such, the project would not exacerbate wildfire risks or the uncontrolled spread of wildfire, resulting in **no impact** related to wildland fire risks.

c) Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

The project would not require the installation of associated infrastructure for fire protection purposes. No structures or other improvements subject to combustion or requiring protection from fire are included or proposed in the multi-use trail proposal. The trail itself would assist firefighting access to most of the project site, without the need for other roads. The project would therefore have **no impact** with respect to infrastructure or systems necessary for fire protection.

d) Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

The project would not include the development of any habitable structures. The concrete path and steel frame bridge structure would not be prone to damage by wildfire. Created slopes along the trail alignment would be less steep than the existing manufactured slopes, decreasing the potential for shallow soil movement down these slopes. Run off from the new trail would be accommodated by existing and proposed drainage facilities which would convey storm water short distances for release at the adjacent beach. No existing homes or structures are located adjacent to the trail alignment that could be affected by secondary effects from a wildland fire event which involves the project site. Therefore, the project would have **no impacts** on risks related to wildland fire.

e) Would the project result in cumulatively considerable impacts relating to wildfire?

Cumulative development throughout the Carpinteria Valley would incrementally contribute to wildland fire risks and related impacts. However, as the proposed project would result in less than significant or no impacts to wildland fire risks, it would have a less than cumulatively considerable contribution to cumulative impacts.

4.6.5 Level of Significance Prior to Mitigation

As discussed above, no significant impacts related to wildfire would result from the proposed project.

4.6.6 Conclusion

The proposed project would neither construct structures nor place combustible materials on the site. Proposed grading modifications would not increase wildland fire risk, and the project would not lead to an increase in local population that could be exposed to existing regional wildland fire risks. As such, the project would have no impacts on wildland fire risk and no mitigations would be required or recommended.

5 Other CEQA Considerations

5.1 Growth-Inducing Impacts

Section 15126.2(e) of the California Environmental Quality Act (CEQA) Guidelines requires a discussion of how the potential growth-inducing impacts of the project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Induced growth is distinguished from the direct employment, population, or housing growth of a project (14 CCR 15000 et seq.). If a project has characteristics that "may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively," then these aspects of the project must be discussed as well. Induced growth is any growth that exceeds planned growth and results from new development that would not have taken place in the absence of the proposed project. Typically, the growth-inducing potential of a project would be considered significant if it stimulates population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities, such as the Santa Barbara County Association of Governments (SBCAG).

1. The CEQA Guidelines also indicate that growth should not be assumed to be either beneficial or detrimental (14 CCR 15126.2[d]). According to Section 15126.2(e) of the CEQA Guidelines, a project is defined as growth inducing when it directly or indirectly:
2. Fosters population growth;
3. Fosters economic growth;
4. Includes the construction of additional housing in the surrounding environment;
5. Removes obstacles to population growth;
6. Taxes existing community service facilities, requiring construction of new facilities that could cause significant environmental effects; and/or
7. Encourages or facilitates other activities that could significantly affect the environments, either individually or cumulatively.

5.1.1 Growth Inducement Due to Population Growth

As discussed in Section 4.4, Population and Housing, of this Environmental Impact Report (EIR), the proposed Carpinteria Rincon Trail Project (project) would not contribute to population growth in the City of Carpinteria (City) or the County of Santa Barbara (County). The proposed project would generate short-term employment opportunities during construction of the proposed trail. Given the temporary duration of project construction of approximately 24 months and availability of construction workers within Santa Barbara and Ventura Counties, project construction is unlikely to generate a significant increase in population and/or new development that could result in a significant impact to the environment. The proposed trail maintenance would be performed by existing City or County parks and recreation/maintenance staff and would not require additional part- or full-time employees. Therefore, the project would not induce substantial unplanned population growth in an area, either directly or indirectly, and would not result in growth inducement due to population growth.

5.1.2 Growth Inducement Due to Economic Growth

An increase in population would foster economic growth by increasing demand for regional and local goods and services. However, as discussed above, the proposed project would generate short-term employment opportunities during construction of the proposed trail and no additional employees during operations and maintenance of the trail. Therefore, the project is not expected to result in substantial growth inducement associated with economic growth.

5.1.3 Growth Inducement Due to Additional Housing

The proposed project involves construction of a proposed trail and no housing is proposed. Therefore, the proposed project would not result in growth inducement due to additional housing.

5.1.4 Growth Inducement Due to Removal of Obstacles

Indirect growth can also occur by a project installing infrastructure that can support further growth. The proposed project includes development of a recreational trail. Therefore, the project would not require utility infrastructure. The proposed Carpinteria Rincon Trail would extend from the eastern end of Carpinteria Avenue, in the City of Carpinteria, to Rincon Beach County Park, in unincorporated Santa Barbara County. The new, shared-use trail would provide a strategic addition to Carpinteria's Coastal Vista Trail that upon completion, will connect Padaro Lane to the west and Rincon Beach County Park to the east. In addition, the project would provide a connection to the newly opened bike path to Mussel Shoals as well as serve as a link in the larger California Coastal Trail. Although the proposed project would result in expansion of pedestrian and bicycle infrastructure, which would provide additional recreational opportunities to nearby residents and visitors, the proposed project is not anticipated to result in additional development in the area. Therefore, as the proposed project would not provide a surplus in traditional urban systems infrastructure capacity that would induce growth in surrounding areas, the project would not be considered growth inducing due to removal of obstacles to population growth.

5.2 Significant Irreversible Changes

The California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) require an Environmental Impact Report (EIR) to address any significant irreversible environmental changes that would result from a project should it be implemented. Pursuant to Section 15126.2(d) of the CEQA Guidelines, significant irreversible environmental impacts could involve:

- Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter unlikely;
- The primary and secondary impacts of the project would generally commit future generations of people to similar uses;
- Irreversible damage from environmental accidents associated with the project;
- The proposed consumption of resources is not justified (e.g., the project results in wasteful use of energy).

Determining whether a project could result in significant and irreversible effects requires a determination of whether key resources would be degraded or destroyed in such a way that there would be little possibility of restoring them.

Implementation of the proposed project would involve consumption of limited, slowly renewable, and non-renewable resources. This consumption would occur during the construction phase of the project and would not continue throughout its operational lifetime. The project would require a commitment of resources that would include materials needed for the proposed trail, fuel and operational materials/resources, and the transportation of goods and people to and from the project site.

Construction of the project would require the consumption of resources that are not renewable or that may renew so slowly as to be considered non-renewable. These resources would include the following construction supplies: aggregate materials such as sand, gravel, or stone; water; and fossil fuels such as gasoline and oil.

Once constructed, the proposed project would result in consumption of minor limited, slowly renewable, and non-renewable resources. The resources that would be committed during operation of the project could include petroleum needed for transportation to and from the site, for those trail users not opting to cycle or walk to the new trail. No other fossil fuels, such as electricity or petroleum, would be required for operations of the proposed project. As discussed in Section 4.2, Energy, of this EIR, the project would result in less-than-significant impacts related to the potential wasteful, inefficient, or unnecessary consumption of energy resources during project construction and operation.

Additionally, the project would involve an unquantifiable, but limited, use of potentially hazardous materials typical for construction, such as gasoline, diesel fuel, lubricating oil, grease, and solvents. These materials would be contained, stored, and used on site in accordance with manufacturers' instructions and applicable standards and regulations. Compliance with regulations would serve to protect against a significant and irreversible environmental change that could result from the accidental release of hazardous materials.

Furthermore, the project would result in direct permanent impacts to one special-status wildlife species, the silvery legless lizard, and nesting birds and sensitive natural communities. Permanent project impacts would consist of vegetation clearing, grading, and construction of the proposed trail. Permanent impacts to special-status wildlife species, nesting bird habitats, and sensitive natural communities would be considered potentially significant under CEQA and would require implementation of mitigation measures, as outlined in Section 3.3, Biological Resources, to reduce impacts to a level below significance.

5.3 Significant and Unavoidable Impacts

CEQA Guidelines Section 15126.2(b) requires an EIR to describe significant impacts that cannot be avoided, even with implementation of feasible mitigation measures. Chapter 1, Executive Summary, of this EIR provides a summary of the environmental impacts that could result from implementation of the proposed project and feasible mitigation measures that could reduce or avoid those environmental impacts As discussed throughout Chapter 3, Environmental Analysis, with implementation of mitigation measures, the proposed project would not result in any significant and unavoidable impacts.

INTENTIONALLY LEFT BLANK

6 Alternatives

6.1 Introduction

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, Environmental Impact Reports (EIRs) are required to "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives" (14 CCR 15126.6[a]). This EIR "must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation" (14 CCR 15126.6[a]). The alternatives discussion is required even if these alternatives "would impede to some degree the attainment of the project objectives or would be more costly" (14 CCR 15126.6[b]).

The inclusion of an alternative in an EIR does not constitute definitive evidence that the alternative is in fact "feasible." The final decision regarding the feasibility of alternatives lies with the decision maker for a given project who must make the necessary findings addressing the potential feasibility of reducing the severity of significant environmental effects (California Public Resources Code, Section 21081; see also 14 CCR 15091).

6.2 Project Objectives

The proposed trail was identified by the City to meet critical safety and public access needs. Objectives of the proposed Carpinteria Rincon Trail Project (project) include the following:

- Improve pedestrian and bicyclist safety, as well as vehicular safety, by significantly reducing unsafe and/or illegal use of the railway corridor and the U.S. Highway 101 shoulder.
- Enhance regional mobility for cyclists and pedestrians, while enhancing support of regional initiatives to promote alternative transportation modes between Carpinteria, Santa Barbara County and Ventura County, by providing a continuous bike and pedestrian path connecting Santa Barbara County to Ventura County.
- Reduce air pollution from vehicle-related air quality emissions and traffic congestion on local and regional transportation systems by promoting pedestrian and bicycle access to coastal resources and recreation opportunities via a scenic multi-use trail, as an alternative to use of motorized vehicles to access and experience such coastal resources.
- Improve the local coastal bluff environment through improved water quality of surface water runoff through stabilization of bluff slope faces that are currently eroding into the Pacific Ocean, and enhancement of sensitive coastal bluff scrub habitats in the project area. Also, avoid deposits of petroleum fuels or lubricants associated with typical motor vehicle use for transportation in close proximity to the ocean, preventing such pollutants from stormwater runoff entering the adjacent marine environment.
- Complete a critical missing link in the California Coastal Trail consistent with the goals of Senate Bill 908, including provision of a continuous trail as close to the ocean as possible, with connections to the shoreline at appropriate intervals and sufficient access to encourage public use. The California Coastal Trail is intended to offer scenic coastal vistas, wildlife viewing areas, recreational or interpretive facilities, and other points of interest, and is recognized in regions throughout the state as a key resource or opportunity for these coastal-oriented experiences.

- Provide a coastal-oriented pathway that supports the broadest use by the public through a design that complies with standards established via the Americans with Disabilities Act (ADA).
- Provide new scenic coastal access and coastal tourism opportunities in the City of Carpinteria, and Santa Barbara County.

6.3 Significant Impacts

As discussed throughout Chapter 3, Environmental Analysis, of this EIR, implementation of the proposed project would not result in any significant and unavoidable impacts on the environment. Prior to mitigation, the proposed project would result in potentially significant impacts related to aesthetics, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, and utilities and service systems. However, with implementation of mitigation measures provided in Table 1-1, Summary of Project Impacts, of Chapter 1, Executive Summary, all potentially significant impacts would be mitigated to below a level of significance.

6.4 Alternatives Considered but Rejected

State CEQA Guidelines Section 15126.6(c) provides guidance in selecting a range of reasonable alternatives for the project. The EIR should also identify any alternatives that were considered by the lead agency but were rejected during the planning or scoping process and briefly explain the reasons underlying the lead agency's determination. Among the factors that may be used to eliminate alternatives from detailed consideration in an EIR are (i) failure to meet most of the basic project objectives, (ii) infeasibility, or (iii) inability to avoid significant environmental impacts.

State CEQA Guidelines Section 15126.6(f)(1) provides the following guidance in selecting a range of reasonable alternatives for the project. There are many factors that may be taken into account when addressing the feasibility of a range of potential alternatives for the project, such as site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries, and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent). The alternatives discussion shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects (14 CCR 15126.6[f]). The EIR should also identify any alternatives that were considered by the lead agency but were rejected during the planning or scoping process and briefly explain the reasons underlying the lead agency's determination (14 CCR 15126.6[c]).

The EIR need not discuss every alternative to the project. A range of alternatives that are "reasonable" for analysis have been evaluated and are discussed below in Section 6.5, Project Alternatives Under Further Consideration. The following describes other alternatives considered by the City of Carpinteria (City) but dismissed from further evaluation in this EIR, and a brief description of the reasons for their rejection.

6.4.1 Alternative Location

Pursuant to Section 15126.6(f)(2) of the CEQA Guidelines, the City considered the potential for alternative locations to the project. The proposed project is planned to function as the local section of the scenic California Coastal Trail, and would be connected to existing trail segments on both ends. The proposed project is heavily oriented toward closing this important regional gap within this existing trail system. Therefore, no feasible alternative locations exist for the proposed project. As such, an alternative location was ultimately rejected from further analysis in the EIR.

6.5 Project Alternatives Under Further Consideration

Section 15126.6 of the CEQA Guidelines states that the EIR shall "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives."

The range of alternatives evaluated in an EIR is governed by the "rule of reason" that requires the EIR set forth only those alternatives necessary to permit a reasoned choice. An EIR need not consider an alternative whose effects cannot be reasonably ascertained and whose implementation is remote and speculative (14 CCR 15126.6[a]).

In developing the alternatives to be addressed in this EIR, the potential alternatives were evaluated in terms of their ability to meet the basic objectives of the project, while reducing or avoiding the environmental impacts of the project identified in Chapter 3 of this EIR.

In determining what alternatives should be considered in the EIR, it is important to acknowledge the objectives of the project, the project's significant effects, and unique project considerations. These factors are crucial to the development of alternatives that meet the criteria specified in California Code of Regulations (CCR) Section 15126.6(a). Although, as noted above, EIRs must contain a discussion of "potentially feasible" alternatives, the ultimate determination as to whether an alternative is feasible or infeasible is made by the lead agency's decision-making body, the Carpinteria Planning Commission (see PRC Section 21081[a] [3]).

This chapter discusses alternatives to the proposed project, including the No Project/No Build Alternative. The No Project/No Build Alternative is a required element of an EIR pursuant to Section 15126.6(e) of the CEQA Guidelines that examines the environmental effects that would occur if the project were not to proceed. The alternatives addressed in this chapter are listed below, followed by a more detailed discussion of each:

1. Alternative 1: No Project/No Build Alternative
2. Alternative 2: Maximize Existing Benchwork/Topography Alternative
3. Alternative 3: Steeper Slopes/Reduced Earthwork Alternative
4. Alternative 4: Freeway Adjacent Trail Avoiding Bluff Face Alternative

6.6 Alternatives Impact Summary

6.6.1 No Project/No Build Alternative (Alternative 1)

Project Alternative 1 Summary

CEQA Guidelines Section 15126.6 requires the inclusion of a No Project/No Build Alternative (Alternative 1) to be analyzed. Under Alternative 1, no development would occur on the project site. Accordingly, the site characteristics of this alternative would be equivalent to the existing conditions for each category analyzed in Chapter 3 of this EIR. In particular, pedestrian and cyclist travel between the eastern terminus of Carpinteria Avenue and Rincon Beach County Park would continue to be limited to the shoulder of US Highway 101 or to informal pathways that require illicit crossing of the UPRR alignment. In addition, the excessively steep cut slopes along the ocean bluffs, remnant from former transportation projects, would continue to experience elevated erosion rates.

Project Alternative 1 Impact Analysis

Aesthetics

The proposed project would result in less than significant impacts associated with aesthetics, with implementation of **Mitigation Measure (MM) AES-1** and **MM-BIO-3**. Alternative 1 would not result in any changes to the existing visual character, views, or lighting and glare. The site would remain as undeveloped land. Therefore, no impacts to aesthetics would occur under Alternative 1 because no development would occur on the project site and **MM-AES-1** and **MM-BIO-3** would not be required to reduce impacts to aesthetics. Therefore, the project's impacts to aesthetics would be reduced under Alternative 1.

Air Quality

Under Alternative 1, there would be no criteria air pollutant emissions during construction or for maintenance during operation. The Alternative would not generate traffic as there would be no construction or operation, and thus would not impact sensitive receptors, create a CO hotspot, or emit toxic air contaminants. This Alternative would also not generate odors as there would be no construction or operation. There would be no impact to air quality under Alternative 1, and thus impacts would be reduced.

Biological Resources

The No Project/No Build Alternative would not result in any changes to the currently undeveloped project site. The No Project/No Build Alternative would not result in any direct/indirect impacts to biological resources as would occur with development of the proposed project, since there would be no project related grading or construction involved. Therefore, impacts to biological resources including sensitive native vegetation communities, special-status wildlife species, and nesting birds would be reduced under the No Project/No Build Alternative.

Cultural Resources

The No Project/No Build Alternative would not result in any changes to the currently undeveloped project site. The No Project/No Build Alternative would not result in any direct/indirect impacts to cultural resources as would occur with development of the proposed project, since there would be no project related grading or construction involved. Therefore, impacts to cultural resources would be eliminated under the No Project/No Build Alternative and reduced compared to the proposed project.

Energy

The proposed project would result in less than significant impacts to energy. Under Alternative 1, there would be no energy use as the development of a trail would not occur. Therefore, no impact to energy would occur under Alternative 1; thus, impacts would be reduced.

Geology and Soils

The No Project/No Build Alternative would not result in any changes to the project site. The No Project/No Build Alternative would not result in any direct/indirect impacts to geologic resources as would occur with development of the proposed project, since there would be no project related grading or earthwork modification. However, as discussed in Section 3.5.1, the existing ocean-facing slope south of the proposed bridge is considered to be

susceptible to surficial/local instability under static conditions. These steep slopes in the southern trail alignment are the result of former landform modification carried out for the railroad alignment and former state highway, and do not represent natural conditions resulting from natural weathering of the involved earth materials and geologic formations. Therefore, erosion of the existing hillside could still occur under existing conditions and therefore under Alternative 1. The proposed project would implement measures such as native plantings and the application of hydro-seed, to stabilize slope areas to minimize soil erosion; no such remedial measures to address slope instability would occur under the No Project/ No Build alternative, However, Alternative 1 would not require implementation of mitigation measures to address significant geology-related impacts from occurring that involve structural damage from seismic events, differential settlement of the pedestrian bridge structure, shallow slope instability associated with seismic activity, and increased soil erosion on slopes graded for the project. Therefore, impacts related to short-term construction-related increased erosion and structural damage from seismicity, would be reduced under the No Project/No Build Alternative.

Greenhouse Gas Emissions

Under Alternative 1, there would be no greenhouse gas (GHG) emissions during construction or for maintenance during operation. There would be no loss of sequestered carbon as no vegetation would be removed. This Alternative may not be consistent with some of the County's or City's goals to increase recreation opportunities or the state's goal to create multimodal communities, which are designed to reduce GHG emissions by encouraging alternative modes of transportation instead of motor vehicle access to coastal recreation areas. Impacts to GHG emissions would be less than significant and similar to that of the proposed project

Hazards and Hazardous Emissions

The No Project/No Build Alternative would not result in any changes to the project site. The No Project/No Build Alternative would not result in any direct/indirect impacts to hazards or hazardous emissions during project construction, as would occur with development of the proposed project, since there would be no project related construction involved. Therefore, impacts related to hazards or hazardous emissions would be reduced under the No Project/No Build Alternative.

Hydrology and Water Quality

Under Alternative 1, there would be no construction or other alterations to the existing project site. As such, water quality impacts associated with erosion of disturbed soil and release of construction related petroleum products would be avoided. Although the proposed project would result in improved stormwater drainage infrastructure and implementation of features such as native plantings and the application of hydro-seed, to stabilize slope areas to minimize soil erosion and avoid sediment-related water quality impacts, impacts to hydrology and water quality associated with the proposed project would be potentially significant and mitigation measures **MM-WAT-1** through **MM-WAT-6** would be required. Alternative 1 would result in no development at the project site and therefore potentially significant impacts would be avoided and mitigation measures would not be required. As such, hydrology, and water quality impacts under Alternative 1 would be reduced.

Land Use and Planning

Impacts due to conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect would be potentially significant. Therefore, **Mitigation Measures (MM) AES-1; MM-BIO-1** through **MM-BIO-6; MM-CR-1** through **MM-CR-4; MM-GEO-1 through MM-GEO-3; MM-HAZ-1; MM-WAT-1** through

MM-WAT-6; MM-NOI-1 through MM-NOI-2; MM-TCR-1 would reduce impacts to conflicts with any land use plan, policy, or regulations to less than significant with mitigation. Alternative 1 would be inconsistent with City and County General Plan policies that support construction of the proposed trail. However, because Alternative 1 would result in no development, mitigation measures would not be required and impacts would be reduced compared to the proposed project.

Noise

The No Project/No Build Alternative would not result in any changes to the project site. The No Project/No Build Alternative would not result in any direct/indirect impacts from noise emissions during project construction, as would occur with development of the proposed project, since there would be no project related construction involved. Therefore, impacts related to noise would be reduced under the No Project/No Build Alternative.

Recreation

Under Alternative 1, there would be no changes or alterations to the project site. There would be no provision of a multi-use trail for cyclists and pedestrians, and the substantial gap that currently exists in the Coastal Trail system would remain. In this regard, enhancement of local and regional biking and hiking opportunities delivered by the project would not occur under Alternative 1, and recreational and safety benefits of the project would not be realized. On the other hand, re-grading of the bluff slopes would not occur under Alternative 1, thereby preserving the existing wind and uplift conditions along the bluffs that currently support soaring opportunities in the air space above the trail alignment. This Alternative may not be consistent with some of the County's or City's goals to increase recreation opportunities via completion of a local path that also closes a gap in the regional coastal trail network, or the state's goal to create multimodal transportation opportunities to reduce reliance on private vehicle use. Therefore, the recreational impacts of Alternative 1 would be similar to or greater than the proposed project.

Transportation

Under Alternative 1, there would be no changes or alterations to the project site. There would be no provision of a multi-use trail for cyclists and pedestrians, and the substantial gap that currently exists in the Coastal Trail system would remain. The use of a vehicle by residents in visiting the Rincon Beach County Park would continue, due to a lack of a safe alternative to vehicle travel from points within Carpinteria. Transportation hazards would persist, in the form of pedestrians using informal trails along the UPRR corridor to navigate to Rincon Beach County Park. In this regard, enhancement of local and regional biking and hiking opportunities delivered by the project would not occur under Alternative 1, and a solution to existing pedestrian hazards of the project would not be realized. The proposed project would contain adequate signage and traffic calming measures to protect pedestrians and cyclists from hazards associated with vehicle parking maneuvers in the Rincon Beach County Park parking lot. Alternative 1 may not be consistent with some of the County's or City's goals to create multimodal transportation opportunities to reduce reliance on private vehicle use, and to provide a safe environment for pedestrian and bicyclist travel. Impacts would be slightly greater under Alternative 1 than the proposed project, because the existing risks to pedestrians and cyclists crossing the UPRR tracks would remain unaddressed.

Tribal Cultural Resources

The No Project/No Build Alternative (Alternative 1) would not result in any changes to the currently undeveloped project site. The No Project/No Build Alternative would not result in any direct/indirect impacts to cultural resources as would occur with development of the proposed project, since there would be no project related grading or construction involved. Therefore, impacts to cultural resources would be eliminated under the No Project/No Build Alternative and reduced compared to the proposed project.

Utilities and Service Systems

The proposed project could have potentially significant impacts upon stormwater systems, for which mitigation has been required. Under Alternative 1, there would be no construction or other alterations to the existing project site. As such, impacts to stormwater systems would be avoided and mitigation would not be required. However, under Alternative 1, existing failing stormwater systems would remain. Nonetheless, Alternative 1 would avoid all construction and mitigation measures **MM-WAT-1** through **MM-WAT-5,** outlined in Section 3.14.5, would not be required. Therefore, impacts to utilities and service systems under Alternative 1 would be reduced.

Relation to Project Objectives

Primary objectives include closing a substantial gap in the Coast Trail System, which in turn would enable regional commuting opportunities that employ alternative transportation modes (i.e., walking and cycling). Another objective is to provide recreation opportunities for all residents, and to enhance formal access to coastal resources including ocean views and a direct route to Rincon Beach County Park from Carpinteria, and to Rincon Bluffs from Rincon Point. The no project alternative would not achieve these primary objectives of the project.

6.6.2 Maximize Existing Benchwork/Topography Alternative (Alternative 2)

Project Alternative 2 Summary

The Maximize Existing Benchwork/Topography Alternative (Alternative 2) would involve development of the originally proposed trail, as described and analyzed in the 2015 Mitigated Negative Declaration (MND). Per the 2015 MND, development under Alternative 2 would consist of a 12-foot wide and approximately 4,000-foot long pedestrian and bicycle shared use trail, that would also extend from the eastern end of Carpinteria Avenue, in the City of Carpinteria (City), to the Rincon Beach County Park in Santa Barbara County (see Figure 6-1, Proposed Alternatives), but following a different alignment than the proposed project. The trail alignment under Alternative 2 was configured to largely follow existing topographic benches that were originally created (and since abandoned) for previous railroad and highway alignments within the project site. Using the existing benches for the alignment was assumed to minimize the need for topographic modification and earthwork volumes. Under Alternative 2, the northern portion of the trail, from the eastern terminus of Carpinteria Avenue to the Union Pacific Railroad (UPRR) corridor, which crosses the middle of the site, traverses an engineered slope, cut during construction of the U.S. Highway 101. The trail proposed under Alternative 2 would cross the UPRR tracks in an area that consists of engineered slopes cut during construction of the UPRR. On the southern side of the UPRR alignment, new grading not associated with an existing bench was proposed, accompanied by extensive retaining walls, to connect the trail to an existing informal trail on an existing cut bench extending westward from Rincon Beach County Park that was abandoned by the UPRR in the late 1960's. The Alternative 2 trail route would be flat in this area.

Project Alternative 2 Impact Analysis

Aesthetics

The proposed project would result in less than significant impacts associated with aesthetics, with implementation of **MM-AES-1** and **MM-BIO-3**. Alternative 2 would result in development of a trail that would follow a different alignment than the proposed project, which would follow existing topographic benches that were originally created (and since abandoned) for previous railroad and highway alignments within the project site. However, because Alternative 2

would be located within a similar location, it would still potentially result in impacts to scenic vistas and scenic resources and would potentially result in significant adverse impacts on visual character or quality of the site and its surroundings because of the removal of mature vegetation and addition of new human-scale development including approximately 1,000 linear feet of retaining walls with a height of up to 14 feet above grade. **MM-AES-1,** which requires City Architectural Review Board and County Board of Architectural Review approval, and **MM-BIO-3**, which requires restoration or enhancement of coastal sage scrub and coastal bluff scrub communities in areas temporarily impacted by construction of the trail or adjacent area, would still be required. Therefore, impacts would be similar to but marginally greater than, the proposed project under Alternative 2.

Air Quality

Alternative 2 would result in a narrower but longer trail than the proposed project. It would result in 46,000 cubic yards (CY) of cut and 10,500 CY of fill, resulting in 35,500 CY of export. This is lower than the proposed project's 92,526CY of export and therefore would result in fewer haul trucks during construction. Alternative 2 would result in fewer haul truck trips and less construction activity as it is fewer square feet of path compared to the proposed project. Therefore, criteria air pollutant emissions during construction are expected to be less than the proposed project. Impacts would be less than significant during construction. During operation, Alternative 2 would result in emissions from maintenance activities similar to the proposed project. Maintenance activities include landscape watering, vegetation control and other trail amenity care and repair, which would involve the temporary use of a light-duty truck that would generate nominal air pollutant emissions. Operational impacts would be considered less than significant and similar to the proposed project.

Biological Resources

The Maximum Existing Benchwork/Topography Alternative, would overall disturb less area than the proposed project. Project temporary impacts total 4.02 acres and this alternative has no temporary impacts identified, resulting in a net decrease of 4.02 acres of temporary impacts. It should be noted that although temporary impacts have not been identified, this alternative will likely result in temporary impacts. Project permanent impacts total 1.02 acres and this alternative includes 0.67 acres of permanent impacts resulting in a net decrease of 0.35 acres of permanent impacts. Overall, the net impacts will decrease by 4.37 acres under this alternative since less grading and earthwork is required. More specifically, the project would result in 3.55 acres of temporary impacts to County ESH and City ESHA and this alternative has no temporary impacts identified, resulting in a net decrease of 3.55 acres of temporary impacts to County ESH and City ESHA. The project will result in 0.76 acres of permanent impacts to County ESH and City ESHA and this alternative includes 0.51 acres of permanent impacts to County ESH and City ESHA, resulting in a net decrease of 0.25 acres of permanent impacts to County ESH and City ESHA. Overall, the net impacts to County ESH and City ESHA would decrease by 3.80 acres under this alternative since less grading and earthwork is required.

Because the vast majority of impacts under the proposed project are occurring within sensitive native vegetation communities identified as County ESH and City ESHA and require mitigation, this alternative would result in fewer overall impacts. However, mitigation measures associated with County ESH and City ESHAs would still be required. While less area is proposed to be impacted under this alternative, similar impacts to special-status wildlife species and nesting birds may occur and would require similar mitigation. Therefore, due to the decreased overall direct impacts to sensitive native vegetation communities identified as County ESH and City ESHA, impacts to biological resources would be reduced under the Maximum Existing Benchwork/Topography Alternative, Alternative 2.

Cultural Resources

Alternative 2 would result in a narrower but longer trail than the proposed project. As discussed in Section 3.4, Cultural Resources, cultural resources are thought to be present between the UPRR crossing bridge and U.S. Highway 101. Development under Alternative 2 would still result in development of the trail in this general area, and would therefore result in impacts to these cultural resources. In addition, the project could still potentially impact undiscovered cultural resources, including archaeological resources and human remains. **MM-CR-1** through **MM-CR-4** would still be required. Impacts would be similar to the proposed project.

Energy

The proposed project would result in less than significant impacts to energy. Alternative 2 would result in a narrower but longer trail than the proposed project. It would result in 46,000 CY of cut and 10,500 CY of fill, resulting in 35,500 CY of export. This is lower than the proposed project's 92,526CY of export and therefore would result in fewer haul trucks during construction. Alternative 2 would result in fewer haul truck trips and less construction activity as it is fewer square feet of path compared to the proposed project. Therefore, energy use during construction are expected to be less than the proposed project. During operation, Alternative 2 would result in emissions from maintenance activities similar to the proposed project. Maintenance activities include landscape watering, vegetation control and other trail amenity care and repair, which would involve the temporary use of a light-duty truck that would consume energy. Operational impacts would be considered less than significant and similar to the proposed project.

Geology and Soils

Alternative 2 would result in 46,000 CY of cut and 10,500 CY of fill, for a total of 56,500 CY of earthwork, which would be approximately 46.2% lower than the proposed project's 122,246 CY of total earthwork. Given the much lower volume of earthwork involved, temporary erosion impacts during construction would be reduced with this alternative; however, **MM-GEO-3** would continue to be required. A similar bridge structure over the UPRR alignment would be employed, although it would be greater in length, and therefore more difficult to design to withstand forces created during a seismic event; **MM-GEO-1** and **MM-GEO-2** would continue to be required. The most substantial difference geologically for Alternative 2 is that geotechnical testing during advancement of the design identified an extensive landslide along the portion of the proposed alignment where the trail changes direction from west to east, on the south side of the UPRR alignment. In order to attempt to stabilize a large landslide feature such as this, multiple deep caissons can be required, and would be intended to pin the mass in place. However, movement can still occur between the caissons, and the expense of the caisson installation could be prohibitive. In that available engineering and geotechnical methods for stabilizing the landslide mass are not known to be feasible, geology and soils impacts related to slope instability under Alternative 2 are considered significant and unavoidable, and impacts would be significantly greater compared to the proposed project.

Greenhouse Gas Emissions

Alternative 2 would result in a narrower but longer trail than the proposed project resulting in 35,500 CY of export. This is lower than the proposed project's 92,526 CY of export and therefore would result in fewer haul trucks during construction. Alternative 2 would result in fewer haul truck trips and less construction activity as it is fewer square feet of path compared to the proposed project. Therefore, GHG emissions during construction are expected to be reduced compared to the proposed project. Impacts would be less than significant during construction. During operation, Alternative 2 would result in emissions from maintenance activities similar to the proposed project.

Maintenance activities include landscape watering, vegetation control and other trail amenity care and repair, which would involve the temporary use of a light-duty truck that would generate nominal air pollutant emissions. Operational impacts would be considered less than significant, and similar to the proposed project.

Hazards and Hazardous Emissions

Alternative 2 would involve a trail length considerably longer than the project trail length. The additional length would not affect use or operation of the trail since no hazardous wastes are anticipated from these activities. However, construction of the proposed project would require heavy construction equipment, which involves the use of hydrocarbon fuels and lubricants that are considered hazardous materials, Concrete is considered a hazardous material until it cures, and is included in the project construction. Paint or other surface coatings are also considered hazardous materials, until they are fully dried; the bridge and certain fencing elements may involve paint application on site. With a comparatively longer trail length under Alternative 2, the volumes of hazardous materials associated with construction would increase and the risk of release would be slightly elevated over project levels. The section of the trail north of the UPRR corridor (the western portion) would have the same potential to encounter soils with ADL as the project. Overall, impacts would be only marginally greater for Alternative 2 compared to the project, relative to the volumes of hazardous materials associated with construction and the risk of release, as well as handling and disposal of ADL containing soils. **MM-WAT-2** and **MM-HAZ-1** would continue to be required, and residual impacts would also be less than significant.

Hydrology and Water Quality

Alternative 2 would result in 46,000 CY of cut and 10,500 CY of fill, for a total of 56,500 CY of total earthwork, which would be approximately 46.2% lower than the proposed project's 122,246 CY of total earthwork. Given the much lower volume of earthwork involved, temporary erosion impacts during construction would be reduced with this alternative; however, **MM-WAT-1**, **MM-WAT-2**, and **MM-WAT-3** would continue to be required. Alternative 2 would also involve a trail length considerably longer than the project trail length. The additional length would increase the impervious surface of the trail, resulting in greater volumes of stormwater runoff. Project storm drain systems would need to be expanded in capacity, and additional new storm drains on the face of the bluff, west of the UPRR crossing point, could be necessitated to serve the trail segments south and west of the UPRR crossing. Given the potential need for additional bluff-face drains, Alternative 2 would have greater hydrology impacts than the project. While **MM-WAT-4**, **MM-WAT-5**, and **MM-WAT-6** would continue to be required to address long-term operational affects upon water quality, storm drain system maintenance requirements and the potential for failure of storm drain system components would be greater under Alternative 2.

Land Use and Planning

The proposed project would result in less than significant impacts to land use and planning with incorporation of **MM-BIO-1** through **MM-BIO-4**, which prescribe required mitigation measures to satisfy requirements found in City and County policies governing ESHA, and less than significant impacts to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect with implementation of **MM-AES-1; MM-BIO-1** through **MM-BIO-6; MM-CR-1** through **MM-CR-4; MM-GEO-1 through MM-GEO-3; MM-HAZ-1; MM-WAT-1** through **MM-WAT-6; MM-NOI-1** through **MM-NOI-2; MM-TCR-1**. As discussed under Biological Resources, above, Alternative 2 would result in decreased overall direct impacts to sensitive native vegetation communities identified as County ESH and City ESHA. However, mitigation measures associated with County ESH and City ESHAs would still be required. In addition, Alternative 2 would still be required to implement similar mitigation measures to address any potential conflicts with land use plan, policy, or regulations adopted for the purpose of avoiding or

mitigating an environmental effect. However, because Alternative 2 would result in decreased overall direct impacts to sensitive native vegetation communities impacts to land use and planning would be reduced under the Maximum Existing Benchwork/Topography Alternative, Alternative 2.

Noise

Alternative 2 would involve a trail length substantially longer than the project, which would increase the duration of activities involving concrete installation and the related necessary equipment. The installation of numerous deep caissons could also be required to attempt to stabilize the landslide area for the trail segments immediately south of the UPRR crossing. The additional trail segments under Alternative 2 would occur south and west of the UPRR crossing, which are not closer to any noise-sensitive users than the remaining trail segments common to the project. Rincon Point residences would remain the closest noise-sensitive receptors to project construction activities. Based on the noise level values at the nearest sensitive receptor, daytime construction noise levels would average approximately 12 dBA lower than ambient noise levels. However, construction noise levels in the evening or overnight period could be plainly audible above background levels and could also result in sleep disturbance for residential occupants. Therefore, as with the project, Alternative 2 temporary construction noise impacts are potentially significant. **MM-NOI-1** and **MM-NOI-2** would continue to be required to reduce construction noise impacts to a less than significant level. Noise impacts from Alternative 2 would be marginally greater than the project, due to the need to import specialized equipment and materials by additional heavy truck trips for the caisson installation.

Recreation

Under Alternative 2, a multi-use trail for cyclists and pedestrians would be constructed and operated, and the substantial gap that currently exists in the Coastal Trail system would be filled. In this regard, enhancement of local and regional biking and hiking opportunities delivered by the project would also occur under Alternative 2, and the recreational benefits of the project would be realized. In addition, members of the soaring community have provided comments indicating they believe this original trail alignment would not have adverse effects upon the existing wind and uplift conditions along the bluffs that currently support soaring opportunities in the air space above the trail alignment. However, the original alignment did not achieve an overall path grade that would meet ADA requirements, and therefore the trail under alternative 2 would not meet the objective of providing recreation opportunities to the broadest segment of the local and visitor populations. Overall, the recreation impacts and benefits of Alternative 2 would be very similar to the project, in that perceived lesser impacts on soaring opportunities under this alternative would be offset by eliminating trail use by mobility impaired individuals.

Transportation

Alternative 2 would provide a multi-use trail for cyclists and pedestrians, and the substantial gap that currently exists in the Coastal Trail system would be eliminated. The use of a vehicle by residents in visiting the Rincon Beach County Park would be expected to decline, due to the existence of a new safe alternative to vehicle travel from points within Carpinteria. Transportation hazards associated with pedestrians crossing the UPRR alignment to navigate to Rincon Beach County Park would be resolved. In this regard, the enhancements of local and regional biking and hiking opportunities delivered by the project would occur under Alternative 2, and a solution to existing pedestrian hazards of the project would be realized. This alternative would have transportation benefits and impacts equivalent to the project.

Tribal Cultural Resources

Alternative 2 would be narrower but longer than the proposed project. As discussed in Section 3.13, Tribal Cultural Resources, no previously recorded archaeological resources of Native American origin or TCRs were identified within the project site. Further, no TCRs have been identified by California Native American tribes as part of the City's AB 52 notification process, and no California Native American tribes requested consultation with the City. However, there is still a potential for unknown subsurface TCRs to be significantly impacted by the project, which could result in a potentially significant impact. Development under Alternative 2 would still result in development of the trail in this general area, and would therefore result in similar impacts to TCRs. **MM-CR-1** through **MM-CR-4** and **MM-TCR-1** would still be required. Impacts would be similar to the proposed project.

Utilities and Service Systems

Alternative 2 would result in 46,000 CY of cut and 10,500 CY of fill, for a total of 56,500 CY of total earthwork, which would be approximately 46.2% lower than the proposed project's 122,246 CY of total earthwork. Although a much lower volume of earthwork would be required for Alternative 2, impacts to existing drainage patterns of the site would still occur. Therefore, **MM-WAT-1**, **MM-WAT-2**, **MM-WAT-3**, and **MM-WAT-4** would continue to be required. Alternative 2 would also involve a trail length considerably longer than the project trail length. The additional length would increase the impervious surface of the trail, resulting in greater volumes of stormwater runoff. Project storm drain systems would need to be expanded in capacity, and additional new storm drains on the face of the bluff, west of the UPRR crossing point, could be necessitated to serve the trail segments south and west of the UPRR crossing. Given the potential need for additional bluff-face drains, Alternative 2 would have greater impacts to utilities and service systems than the project.

Relation to Project Objectives

Alternative 2 would meet project objectives including closing an important gap in the coastal trail network, the provision of a safe route for cyclists and pedestrians between eastern Carpinteria and Rincon Beach County Park, the promotion of alternative transportation to reduce air quality and GHG emissions, and the creation of ocean viewing opportunities for cyclists and pedestrians along the section of the trail southward of the UPRR alignment. However, the presence of a substantial landslide area that could prove infeasible to stabilize makes the feasibility of this alignment very questionable. Also, as discussed in Recreation, above, the original alignment did not achieve an overall path grade that would meet ADA requirements, and therefore the trail under alternative 2 would not meet the objective of providing recreation opportunities to the broadest segment of the local and visitor populations.

6.6.3 Steeper Slopes/Reduced Earthwork Alternative (Alternative 3)

Project Alternative 3 Summary

Under the proposed project, to achieve compliance with pathway surface slope limitations under the Americans with Disability Act (ADA), the existing benched slope would be regraded along the entire trail alignment. On some portions of the trail, the proposed project also includes creation of a second earthwork bench on the new slope above the trail to reduce erosion potential. The Steeper Slopes/Reduced Earthwork Alternative (Alternative 3) would remove one of the earthwork benches that was originally proposed on the slope above the trail alignment, for a portion of the trail length. The cross sections proposed under Alternative 3 are shown in Illustration 6-1, Steeper Slopes/Reduced Earthwork Alternative (Alternative 3) Trail Cross Section, below. Alternative 3 would result in a 7.6% reduction of earthwork, or 10,015 less CY, compared to the project. Under Alternative 3, the proposed

alignment would be the same as the proposed project. Similar to the proposed project, a bridge would be provided to provide safe crossing for trail users over the UPRR. However, the cross section of the trail south of the UPRR crossing, on the eastern portion of the trail alignment, would be different. More specifically, Alternative 3 would not provide benches above the trail (to control drainage and rockfall).

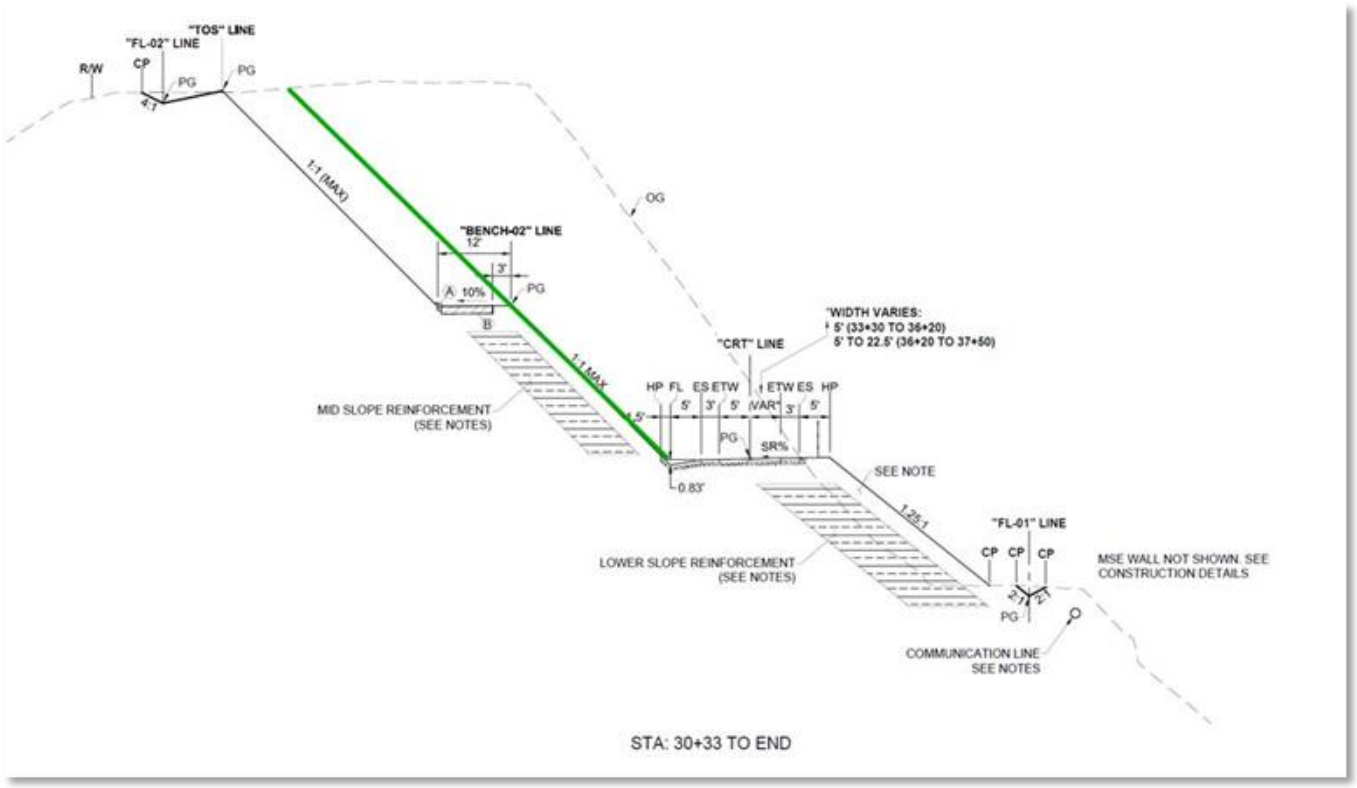

Illustration 6-1 Steeper Slopes/Reduced Earthwork Alternative (Alternative 3) Trail Cross Section

Legend for Illustration 6-1:

CP	Control Point (survey tie-in)
CRT	Center of Route Travel
ETW	Edge of Travel Way
ES	Edge of Shoulder
FL	Flow Line (of drain swale adjacent to path)
HP	High Point (of drain swale adjacent to path)
OG	Original Grade
PG	Project Grade

Project Alternative 3 Impact Analysis

Aesthetics

The proposed project would result in less than significant impacts associated with aesthetics, with implementation of **MM-AES-1** and **MM-BIO-3**. Alternative 3 would result in development of a trail that would follow the same alignment as the proposed project. However, under Alternative 3, one of the earthwork benches that was originally proposed

on the slope above the trail alignment would be removed, for a portion of the trail length. However, because Alternative 3 would be located within the same location as the project, it would still potentially result in impacts to scenic vistas and scenic resources and would potentially result in a significant adverse impact on visual character or quality of the site and its surroundings because of the removal of mature vegetation and addition of new human-scale development. **MM-AES-1,** which requires City Architectural Review Board and County Board of Architectural Review approval, and **MM-BIO-3**, which requires restoration or enhancement of coastal sage scrub and coastal bluff scrub communities in areas temporarily impacted by construction of the trail or adjacent area, would still be required. Therefore, impacts would be similar to the proposed project under Alternative 3.

Air Quality

Alternative 3 would result in 96,077 CY of cut and 10,570 CY of fill, resulting in 85,507 CY of export. This is lower than the proposed project's 92,526 CY of export and therefore would result in fewer haul trucks during construction. Therefore, criteria air pollutant emissions during construction are expected to be less than the proposed project. Impacts would be less than significant during construction. During operation, Alternative 3 would result in emissions from maintenance activities similar to the proposed project. Maintenance activities include landscape watering, vegetation control and other trail amenity care and repair, which would involve the temporary use of a light-duty truck that would generate nominal air pollutant emissions. Operational impacts would be considered less than significant, and similar to that of the proposed project.

Biological Resources

Alternative 3 would disturb approximately the same area as the proposed project. While the volume of sediment removed and grading configuration proposed for this alternative would reduce overall earthwork, it would occur within the same overall grading and development footprint since the location of the trail alignment would be the same as for the proposed project. Additionally, impacts to special-status wildlife species and nesting birds would be similar under this alternative since the temporary and permanent impact footprints are approximately the same. The Steeper Slopes/Reduced Earthwork Alternative would result in similar temporary and permanent impacts to biological resources as the proposed project and would require similar mitigation because development would generally occur within the same footprint as the proposed project. Therefore, the Steeper Slopes/Reduced Earthwork Alternative would result in similar impacts to biological resources.

Cultural Resources

Alternative 3 would disturb approximately the same area as the proposed project. As discussed in Section 3.4, cultural resources are present between the UPRR crossing bridge and U.S. Highway 101. Development under Alternative 2 would still result in development of the trail in the same area, and would therefore result in impacts to these existing cultural resources. In addition, the project could still potentially impact undiscovered cultural resources, including archaeological resources and human remains. **MM-CR-1** through **MM-CR-4** would still be required. Impacts would be similar to the proposed project.

Energy

Alternative 3 would result in 96,077 CY of cut and 10,570 CY of fill, resulting in 85,507 CY of export. This is slightly lower than the proposed project's 92,526 CY of export and therefore would result in fewer haul trucks during construction. Therefore, energy use during construction is expected to be less than the proposed project. During operation, Alternative 3 would result in energy use from maintenance activities similar to the proposed project.

Maintenance activities include landscape watering, vegetation control and other trail amenity care and repair, which would involve the temporary use of a light-duty truck that would generate nominal energy usage. Operational impacts would be considered less than significant, and similar to the proposed project.

Geology and Soils

Alternative 3 would result in 110,019 less CY of earthwork, compared to the project. Under Alternative 3, the proposed alignment would be the same as the proposed project. However, for the cross section of the trail south of the UPRR crossing, on the eastern portion of the trail alignment, Alternative 3 would not provide benches above the trail. Given the lower volume of earthwork involved, temporary erosion impacts during construction would be reduced with this alternative; however, **MM-GEO-3** would continue to be required. The same bridge structure over the UPRR alignment would be employed, and therefore **MM-GEO-1** and **MM-GEO-2** would continue to be required. Updated geotechnical design details would be needed to address long-term stability of the regraded slopes south of the UPRR alignment, but the project engineers have indicated that feasible methods to achieve such stability are available and could be detailed in an updated geotechnical report if Alternative 3 were to be selected for implementation. Therefore, impacts would be similar to the proposed project.

Greenhouse Gas Emissions

Alternative 3 would result in 96,077 CY of cut and 10,570 CY of fill, resulting in 85,507 CY of export. This is slightly lower than the proposed project's 92,526 CY of export and therefore would result in fewer haul trucks during construction. Therefore, GHG emissions during construction are expected to be less than the proposed project. Impacts would be less than significant during construction. During operation, Alternative 3 would result in GHG emissions from maintenance activities similar to the proposed project. Maintenance activities include landscape watering, vegetation control and other trail amenity care and repair, which would involve the temporary use of a light-duty truck that would generate nominal air pollutant emissions. Operational impacts would be considered less than significant, and similar to the proposed project.

Hazards and Hazardous Emissions

Alternative 3 would involve an identical trail length to the project, but would reduce earthwork by approximately 10,019 CY. The use of heavy equipment would be slightly reduced in duration, compared to the project, due to the reduced earthwork volume. The section of the trail north of the UPRR corridor (the western portion) would have the same potential to encounter soils with ADL. Overall, impacts would remain similar or the same as the project relative to the volumes of hazardous materials associated with construction and the risk of release, as well as handling and disposal of ADL containing soils. **MM-WAT-2** and **MM-HAZ-1** would continue to be required, and residual impacts would also be less than significant.

Hydrology and Water Quality

Alternative 3 would involve an identical trail length to the project but would reduce earthwork by approximately 10,019 CY. With reduced earthwork volume, the potential for erosion during construction would be reduced under Alternative 3, as compared to the project; however, **MM-WAT-1**, **MM-WAT-2**, and **MM-WAT-3** would continue to be required to address potential erosion and other water quality impacts during construction. The trail alignment under Alternative 3 would match the project, and therefore all the proposed storm drain components would continue to adequately serve the stormwater runoff volumes from the project. As with the project, **MM-WAT-4**, **MM-WAT-5**, and **MM-WAT-6** would continue to be required to address long-term operational affects upon water quality. Overall, Alternative 3 would marginally reduce hydrology and water quality impacts when compared to the project.

Land Use and Planning

The proposed project would result in less than significant impacts to land use and planning with incorporation of MM-BIO-1 through MM-BIO-4, prescribes required mitigation measures to satisfy requirements found in City and County policies governing ESHA. As discussed under Biological Resources, above, Alternative 3 would disturb approximately the same area as the proposed project, resulting in similar impacts to ESHA. In addition, the project would result in less than significant impacts to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect with implementation of MM-AES-1; MM-BIO-1 through MM-BIO-6; MM-CR-1 through MM-CR-4; MM-GEO-1 through MM-GEO-3; MM-HAZ-1; MM-WAT-1 through MM-WAT-6; MM-NOI-1 through MM-NOI-2; MM-TCR-1. It is anticipated that Alternative 2 would require similar mitigation measures to reduce potential land use impacts. Thus, impacts to land use and planning would be similar under this alternative.

Noise

Alternative 3 would involve an identical trail length and alignment to the project but would reduce earthwork by approximately 10,019 CY. With reduced earthwork volume, the duration for earthwork activities using heavy equipment would be lessened; nonetheless MM-NOI-1 and MM-NOI-2 would continue to be required to reduce construction noise impacts to a less than significant level. Noise impacts from Alternative 3 would be similar to the project, but somewhat less due to the reduced earthwork volumes involved, as compared to the project.

Recreation

Under Alternative 3, a multi-use trail for cyclists and pedestrians identical to the project would be constructed and operated, and the substantial gap that currently exists in the Coastal Trail system would be filled. Enhancement of local and regional biking and hiking opportunities delivered by the project would also be achieved under Alternative 3, and recreational benefits of the project would be realized. A critical difference would be incorporated, however, in the grading profile for the trail segment along the bluff face adjacent to the ocean; this segment would not be re-graded to create a second bench above the trail bench (unlike the proposed project). The Air Flow Study (Appendix I) found that the elimination of the upper bench would result in a reduction in the vertical wind speed along the bluff edge by 10% to 20%, rather than the 30% maximum reduction resulting from the proposed project. In practical terms, a reduction in vertical wind speeds along the bluffs caused by regrading could maintain conditions favorable for paragliding and hang-gliding activities to occur in the air space over the trail alignment. A vertical wind speed reduction of 10% to 20% would have a lower effect upon soaring opportunities than the 30% reduction associated with the proposed project. As such, Alternative 3 would have lesser impacts on recreation resources and opportunities than the project, specifically in regard to soaring opportunities. Alternative 3 would continue to meet primary recreational objectives for the project by providing a trail that offers views of the Pacific Ocean, that is ADA compliant, and which achieves a safe connection between Carpinteria and the Rincon Beach County Park that can function as an alternative transportation mechanism. This alternative would therefore have lesser impacts on recreation resources than the proposed project.

Transportation

Under Alternative 3, a multi-use trail for cyclists and pedestrians identical to the project would be constructed and operated. Alternative 3 would therefore also close the substantial gap that currently exists in the Coastal Trail system, equivalent to the project. The use of a vehicle by residents in visiting the Rincon Beach County Park would be expected to decline under Alternative 3 as well, due to the existence of a new safe alternative to vehicle travel from points within Carpinteria. Transportation hazards associated with pedestrians crossing the UPRR alignment to

navigate to Rincon Beach County Park would be resolved. In this regard, the enhancements of local and regional biking and hiking opportunities delivered by the project would occur under Alternative 3, and a solution to existing pedestrian hazards of the project would also be realized. This alternative would have transportation benefits and impacts equivalent to the project.

Tribal Cultural Resources

Alternative 3 would disturb approximately the same area as the proposed project. As discussed in Section 3.13, no previously recorded archaeological resources of Native American origin or TCRs were identified within the project site. Further, no TCRs have been identified by California Native American tribes as part of the City's AB 52 notification process, and no California Native American tribes requested consultation with the City. However, there is still a potential for unknown subsurface TCRs to be significantly impacted by the project, which could result in a potentially significant impact. Development under Alternative 3 would result in development of the trail in the same area, and would therefore result in similar impacts to TCRs. **MM-CR-1** through **MM-CR-4** and **MM-TCR-1** would still be required. Impacts would be similar to the proposed project.

Utilities and Service Systems

Alternative 3 would involve an identical trail length to the project but would reduce earthwork by approximately 10,019 CY. Although Alternative 3 would result in reduced earthwork volume, impacts to existing drainage patterns of the site would still occur. Therefore, **MM-WAT-1, MM-WAT-2, MM-WAT-3, and MM-WAT-4** would continue to be required. Therefore, impacts to utilities and service systems would be similar under Alternative 3.

Relation to Project Objectives

Given that Alternative 3 would employ the same alignment as the project and would incorporate an identical trail width to the project, this alternative would be equivalent to the project in meeting all the stated project objectives. With regard to the project objective of reducing regional greenhouse gas emissions, Alternative 3 would be marginally more successful in meeting this objective, as earthwork would be reduced under this alternative, leading to fewer construction equipment emission contributions to greenhouse gas levels.

6.6.4 Freeway Adjacent Trail Avoiding Bluff Face Alternative (Alternative 4)

Under the Freeway Adjacent Trail Avoiding Bluff Face Alternative (Alternative 4), the proposed trail alignment would be the same as the proposed project in the area north of UPRR and within the UPRR crossing. However, south of the UPRR crossing, the proposed alignment would be shifted to the north to remain on the north side of the ridge, and adjacent to the U.S. Highway 101 corridor, compared to the proposed project which locates this segment on the slopes on the south side of the same ridge, and facing the Pacific Ocean. Further, the trail proposed under Alternative 4 would extend further to the southeast, past the Rincon Beach County Park, and terminate at Bates Road (see Figure 6-1). The proposed UPRR crossing would not change under Alternative 4 compared to the proposed project. Under Alternative 4, most of the stormwater down drains proposed along the southern side of the UPRR trail crossing (see Illustration 2-6, Major Storm Drainage Components of the Project, in Chapter 2, Introduction & Project Description), would not be constructed; surface drainage would instead be delivered to existing systems serving the US 101 corridor.. Lastly, under this alternative, retaining walls would be required for the section of trail

extending to Bates Road, aligned to the north of the Rincon Beach County Park parking lot. Retaining walls along this portion of the trail would be approximately 500 feet in length.

Project Alternative 4 Impact Analysis

Aesthetics

The proposed project would result in less than significant impacts associated with aesthetics, with implementation of **MM-AES-1** and **MM-BIO-3**. Alternative 4 would result in development of a trail that would follow the same alignment as the proposed project in the area north of UPRR and within the UPRR crossing. However, south of the UPRR crossing, the proposed alignment would be shifted to the north to remain on the north side of the ridge, and adjacent to the U.S. Highway 101 corridor. In addition, under Alternative 4, the proposed trail alignment would extend further to the southeast, past the Rincon Beach County Park, and terminate at Bates Road. Therefore, without mitigation, impacts may be slightly greater than the proposed project, due to greater area of development. Nonetheless, Alternative 4 would be required to implement **MM-AES-1,** which requires City Architectural Review Board and County Board of Architectural Review approval, and **MM-BIO-3**, which requires restoration or enhancement of coastal sage scrub and coastal bluff scrub communities in areas temporarily impacted by construction of the trail or adjacent area. Lastly, as discussed above, under Alternative 4, retaining walls would be required for the section of trail extending to Bates Road, aligned to the north of the Rincon Beach County Park parking lot. Retaining walls along this portion of the trail would be approximately 500 feet in length. Therefore, due to additional retaining walls, that would be visible to motorists and visitors to the area, impacts to aesthetics under Alternative 4 would be greater compared to the proposed project.

Air Quality

Alternative 4 would result in a longer trail than the proposed project. It would result in 105,300 CY of cut and 710 CY of fill, resulting in 104,590 CY of export. This is greater than the proposed project's 94,100 CY of export and therefore would result in more haul trucks during construction. Alternative 4 would result in greater haul truck trips and greater construction activity as it is more square feet of path compared to the proposed project. Therefore, criteria air pollutant emissions during construction are expected to be greater than the proposed project, but still less than significant. During operation, maintenance activities include landscape watering, vegetation control and other trail amenity care and repair, which would involve the temporary use of a light-duty truck that would generate nominal air pollutant emissions. Operational impacts would be considered less than significant and would be similar to the proposed project.

Biological Resources

Based on impacts within the biological survey area, this alternative would result in a decrease of impacts to sensitive biological resources. However, since a portion of the trail alignment under this alternative has not been surveyed (vegetation mapping, special-status plant species, wildlife species, and tree assessment) a complete comparison analysis cannot be performed to determine if impacts to sensitive biological resources would be increased or reduced under the Freeway Adjacent Trail Avoiding Bluff Face Alternative. Therefore, additional surveys to detect potential sensitive biological resources would be required, and would include vegetation mapping, special-status plant species surveys, a special-status wildlife species habitat assessment, and a tree assessment. While it is unlikely that additional special-status plant or wildlife species may be present along the new trail alignment, since it is located within similar habitats and along previously disturbed and graded slopes within the proposed project footprint, this alternative may result in greater impacts to sensitive vegetation communities included as County ESH and City ESHA, and qualifying trees. The trail alignment under Alternative 4 is longer as compared to the proposed project resulting in more permanent impacts to undeveloped land, and may require removal of eucalyptus trees

located at the eastern terminus of the Rincon Beach County Park parking lot, which are qualifying trees and require mitigation for removal under Santa Barbara County Article II Zoning Ordinance. Therefore, Alternative 4 may require additional mitigation for impacts to sensitive vegetation communities, including County ESH and City ESHA. More specifically, Alternative 4 may result in greater areas of impacts to vegetation communities and therefore require greater mitigation acreages, outlined in a Habitat Mitigation and Monitoring Plan (see **MM-BIO-5**). Mitigation for removal of any qualifying trees impacted would also be required under Alternative 4. Similar impacts to special-status wildlife species and nesting birds are anticipated and would require similar mitigation.

Cultural Resources

Alternative 4 would result in greater ground disturbance compared to the proposed project, due to the longer length of the trail. It is anticipated that impacts to existing cultural resources would still occur, and that potential impacts to undiscovered cultural resources, including archaeological resources and human remains would be greater due to greater area of development. However, the presence of cultural resources within the area expanding the project footprint southeast, past the Rincon Beach County Park, and terminating at Bates Road, are unknown at this time. Therefore, development in this area would require additional investigation to appropriately determine the presence of existing cultural resources and potential impacts to these resources. **MM-CUL-1** through **MM-CUL-4** would still be required. Due to the longer length of the trail under Alternative 4, impacts to cultural resources would be slightly greater than the proposed project and additional mitigation may be required.

Energy

Alternative 4 would result in a longer trail than the proposed project. It would result in 105,300 CY of cut and 710 CY of fill, resulting in 104,590 CY of export. This is greater than the proposed project's 94,100 CY of export and therefore would result in more haul trucks during construction. Alternative 4 would result in greater haul truck trips and greater construction activity as it is more square feet of path compared to the proposed project. Therefore, energy use during construction is expected to be greater than the proposed project, but still less than significant. During operation, maintenance activities include landscape watering, vegetation control and other trail amenity care and repair, which would involve the temporary use of a light-duty truck that would generate nominal energy use. Operational impacts would be considered less than significant and would be similar to the proposed project.

Geology and Soils

In Alternative 4, the proposed trail would employ the same alignment as the project along the north side of the UPRR alignment and would include the same bridge structure over the UPRR alignment. However, after the UPRR bridge, the trail would lead to the existing slope adjacent to U.S. Highway 101 on the north side of the ridge and would regrade this slope with a new bench for the trail. Alternative 4 would involve a similar volume of total earthwork as the project, and therefore short-term erosion impacts during construction would be the same or similar; **MM-GEO-3** would continue to be required. The same bridge structure over the UPRR alignment would be employed, and therefore mitigation measures **MM-GEO-1** and **MM-GEO-2** would continue to be required. The Alternative 4 trail is proposed to extend all the way to Bates Road, aligned to the north of the Rincon Beach County Park parking lot for the eastern portion. Along this section, retaining walls approximately 500 feet in length would be required, to create a bench in this sloped area.. In addition, as discussed in Section 3.5.1, the existing ocean-facing slope south of the proposed trail bridge is considered to be susceptible to surficial/local instability under static conditions. These steep slopes in the southern trail alignment are the result of former landform modification carried out for the railroad alignment and former state highway, and do not represent natural conditions resulting from natural weathering of the involved earth materials and geologic formations. Alternative 4 would not include

any grading of the ocean facing slopes east of the UPRR crossing, and therefore, erosion of the existing hillside could still occur under Alternative 4. The proposed project would implement measures such as native plantings and the application of hydro-seed, to stabilize these ocean-facing slope areas to minimize soil erosion; no such remedial measures to address ocean-facing slope instability would occur under Alternative 4. Given the need for retaining walls for the trail section adjacent to the Rincon Beach County Park, and the absence of remedial grading to address the unstable sections of the ocean-facing slopes, this alternative would have moderately greater impacts to geology and soils than the project

Greenhouse Gas Emissions

Alternative 4 would result in a longer trail than the proposed project. It would result in 105,300 CY of cut and 710 CY of fill, resulting in 104,590 CY of export. This is greater than the proposed project's 94,100 CY of export and therefore would result in more haul trucks during construction. Alternative 4 would result in greater haul truck trips and greater construction activity as it is more square feet of path compared to the proposed project. Therefore, GHG emissions during construction are expected to be greater than the proposed project. Impacts would, however, continue to be less than significant during construction. During operation, Alternative 4 would result in GHG emissions from maintenance activities similar to the proposed project. Maintenance activities include landscape watering, vegetation control and other trail amenity care and repair, which would involve the temporary use of a light-duty truck that would generate nominal air pollutant emissions. Operational impacts would be considered less than significant, and would be similar to the proposed project.

Hazards and Hazardous Emissions

Alternative 4 would involve a trail length considerably longer than the proposed project trail length. The additional length would not affect use or operation of the trail since no hazardous wastes are anticipated from these activities. However, construction of the proposed project would require heavy construction equipment, which involves the use of hydrocarbon fuels and lubricants that are considered hazardous materials. Concrete is considered a hazardous material until it cures, and is included in the project construction. Paint or other surface coatings are also considered hazardous materials, until they are fully dried; the bridge and certain fencing elements may involve paint application on site. With a comparatively longer trail length under Alternative 4, the volumes of hazardous materials associated with construction would increase and the risk of release would be slightly elevated over project levels. Because the entire trail would be aligned on existing slopes facing U.S. Highway 101, a greater volume of soils containing aerially deposited lead (ADL) may be encountered. Surface soils that could potentially contain ADL are likely to be removed and transported off the site. However, some soils containing ADL could be used as fill for the project or could be used off site as fill in areas where the public could have exposure to the soils. Consequently, as with the proposed project, impacts from soil containing ADL under Alternative 4 could be potentially significant. **MM-HAZ-1** would be required to reduce ADL impacts to less than significant. The marginally greater impacts from hazardous materials under Alternative 4 would still be reduced to a level of less than significant through implementation of **MM-WAT-2** and **MM-HAZ-1**, which would continue to be required.

Hydrology and Water Quality

The proposed project would result in construction of improved stormwater drainage infrastructure, which would not be constructed under Alternative 4. In addition, Alternative 4 would result in a similar scale of total earthwork to the proposed project; as such, **MM-WAT-1**, **MM-WAT-2**, and **MM-WAT-3** would continue to be required. In addition, Alternative 4 would involve a trail length considerably longer than the project trail length. The additional length would increase the impervious surface of the trail, resulting in greater volumes of stormwater runoff. Project storm

drain systems would need to be expanded in capacity to accommodate the increased runoff; storm drain management for Alternative 4 has not been fully investigated for the portion of the trail east of the UPRR alignment, but since the entire trail would be on the slope adjacent to U.S. Highway 101, some intertie with Caltrans drainage systems (including possible expansion) may be required. Given the potential need for expansion of drainage systems serving the U.S. Highway 101 corridor, Alternative 4 would have greater hydrology impacts than the project. MM-WAT-4, MM-WAT-5, and MM-WAT-6 would continue to be required to address long-term operational affects upon water quality. In addition, Alternative 4 would fail to correct the elevated erosion associated with the existing steep cut slopes along the ocean bluffs, resulting in greater water quality impacts than the proposed project.

Land Use and Planning

As discussed under Biological Resources, above, because development would generally occur beyond the extent of the current biological survey area and the area of disturbance would be greater due to the length of the Alternative 4 trail, it is assumed that impacts to biological resources would be greater than the proposed project. Alternative 4 may require additional mitigation for impacts to sensitive vegetation communities, including County ESH and City ESHA. More specifically, Alternative 4 may require greater mitigation acreages, outlined in a Habitat Mitigation and Monitoring Plan (see MM-BIO-5). Therefore, impacts to land use and planning would be greater compared to the project.

Noise

Alternative 4 would involve a trail length substantially longer than the project, which would increase the duration of activities involving concrete installation and the related necessary equipment. The additional trail segments under Alternative 4 would occur along the slope facing U.S. Highway 101, which is closer to the most proximate noise-sensitive users than the remaining trail segments common to the proposed project. Rincon Point residences would remain the closest noise-sensitive receptors to project construction activities, which would now be as close as approximately 225 feet (reduced from a minimum distance of 775 feet for the project). At these closest distances, daytime construction noise levels would average approximately 6 dBA lower than ambient noise levels. However, construction noise levels in the evening or overnight period could be plainly audible above background levels and could also result in sleep disturbance for residential occupants. Therefore, as with the project, Alternative 4 temporary construction noise impacts are potentially significant. MM-NOI-1 and MM-NOI-2 are required to reduce construction noise impacts to a less than significant level. Noise impacts from Alternative 4 would be similar to the proposed project, but somewhat greater due to the more extensive concrete work and reduced distance between construction work and adjacent residences.

Recreation

Under Alternative 4, a multi-use trail for cyclists and pedestrians would be constructed and operated, and the substantial gap that currently exists in the Coastal Trail system would be filled, achieving the desired enhancement of local and regional biking and hiking opportunities delivered by the project. In addition, with alignment of the trail along the slope adjacent to the freeway, rather than on the ocean bluff face, Alternative 4 would have reduced effects upon the existing wind and uplift conditions along the bluffs that currently support soaring opportunities in the air space above the trail alignment. However, Alternative 4 would not meet the objective of providing trail users with an experience oriented to the ocean environment north of the UPRR bridge to as great a degree as the project. Rather than a sweeping view of the ocean, beach, and Channel Islands, trail users east of the railroad bridge would overlook the U.S. Highway 101 corridor and be subject to elevated noise levels and emissions from vehicular traffic along this corridor. On the whole, the recreation impacts and benefits of Alternative 4 would be very similar to the project, in that lesser impacts on soaring opportunities under this alternative would be offset by eliminating ocean vistas southeast of the railroad bridge and providing a less noisy environment for enjoyment during walking and cycling along the path.

Transportation

Once again, Alternative 4 would provide a multi-use trail in nearly the same alignment as the project for cyclists and pedestrians. Alternative 4 would therefore also close the substantial gap that currently exists in the Coastal Trail system, similar to the project. The use of a vehicle by residents in visiting the Rincon Beach County Park would be expected to decline under Alternative 4 as well, due to the existence of a new safe alternative to vehicle travel from points within Carpinteria. Transportation hazards associated with pedestrians crossing the UPRR alignment to navigate to Rincon Beach County Park would be resolved. In this regard, the enhancements of local and regional biking and hiking opportunities delivered by the project would occur under Alternative 4, and a solution to existing pedestrian hazards of the project would also be realized. Unlike the proposed project, Alternative 4 would route the trail along the north side of the existing parking lot for Rincon Beach County Park, thereby avoiding potential cyclist and pedestrian conflicts with vehicle parking maneuvers. On the other hand, Alternative 4 may create similar hazards to the project by creating a crossing adjacent to the U.S. Highway 101 off-ramp at Bates Road. As such, Alternative 4 would have similar transportation impacts to the proposed project.

Tribal Cultural Resources

Alternative 4 would result in greater ground disturbance compared to the proposed project, due to the longer length of the trail. As discussed in Section 3.13, no previously recorded archaeological resources of Native American origin or TCRs were identified within the project site. Further, no TCRs have been identified by California Native American tribes as part of the City's AB 52 notification process, and no California Native American tribes requested consultation with the City. However, there is still a potential for unknown subsurface TCRs to be significantly impacted by the project, which could result in a potentially significant impact. Development under Alternative 4 would result in development of a longer trail alignment, and could therefore result in greater impacts to TCRs. However, the presence of existing tribal cultural resources within the area expanding the project footprint southeast, past the Rincon Beach County Park, and terminating at Bates Road, are unknown at this time. Therefore, development in this area would require additional investigation to appropriately determine the potential presence of existing tribal cultural resources and potential impacts to these resources. **MM-CR-1** through **MM-CR-4** and **MM-TCR-1** would still be required, and impacts would be potentially greater than the proposed project.

Utilities and Service Systems

Alternative 4 would involve a longer trail length than the project. The additional length would increase the impervious surface of the trail, resulting in greater volumes of stormwater runoff. Project storm drain systems would need to be expanded in capacity to accommodate the increased runoff; storm drain management has not been fully investigated for the portion of the Alternative 4 trail east of the UPRR alignment, but since the entire trail would be on the slope adjacent to U.S. Highway 101, some intertie with Caltrans drainage systems (including possible expansion) may be required. Given the potential need for expansion of drainage systems serving the U.S. Highway 101 corridor, Alternative 4 would have greater impacts to utilities and service systems than the project. **MM-WAT-1, MM-WAT-2, MM-WAT-3,** and **MM-WAT-4** would continue to be required under this alternative and more mitigation may be required.

Relation to Project Objectives

Alternative 4 would be capable of achieving certain project objectives including closing a substantial gap in the Coast Trail System, which in turn would enable regional commuting opportunities that employ alternative transportation modes (i.e., cycling). Alternative 4 would also satisfy the objective to provide recreation opportunities for all residents, and a direct route to Rincon Beach County Park from Carpinteria, and to Rincon Bluffs from Rincon

Point. Alternative 4 would not, however, meet the multiple project objectives associated with providing trail users with an experience oriented to the ocean environment to the same extent as the project and the other alternatives would provide. Rather than a sweeping view of the ocean, beach, and Channel Islands, trail users would overlook the U.S. Highway 101 corridor and be subject to elevated noise levels and emissions from vehicular traffic along this corridor. Lastly, Alternative 4 would not meet the objective of improving the local coastal bluff environment through improved water quality of surface water runoff through stabilization of ocean-facing bluff slope faces that are currently eroding into the Pacific Ocean, nor would it achieve enhancement of sensitive coastal bluff scrub habitats along the bluff top south of the UPRR alignment in the project area. In this regard, Alternative 4 would not satisfy a number of key objectives identified for the project.

6.7 Environmentally Superior Alternative

The No Project Alternative would result in the least environmental impacts and would be the environmentally superior alternative. However, Section 15126.6(e)(2) of the CEQA Guidelines states that if the environmentally superior alternative is the No Project Alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives. In this case, the environmentally superior alternative is the Steeper Slopes/Reduced Earthwork Alternative (Alternative 3). Alternative 3 would meet all of the project objectives. With regard to the project objective of reducing regional greenhouse gas emissions, Alternative 3 would be marginally more successful in meeting this objective, as earthwork would be reduced under this alternative, leading to fewer construction equipment emission contributions to greenhouse gas levels. This alternative would also marginally reduce erosion potential during construction (due to reduced earthwork volumes), and slightly reduce construction-related noise impacts, compared to the project. Lastly, alternative 3 would also have lesser impacts upon existing soaring opportunities above the trail alignment. The project's impacts are compared to each alternative's impacts in Table 6-1.

Table 6-1. Project Alternatives Environmental Impacts Comparison

Environmental Issue	Project	No Project/ No Build Alternative (Alternative 1)	Maximize Existing Benchwork/ Topography Alternative (Alternative 2)	Steeper Slopes/ Reduced Earthwork Alternative (Alternative 3)	Freeway Adjacent Trail Avoiding Bluff Face Alternative (Alternative 4)

Hi Nick,

I am writing In regards to the planned bike path near Bates beach/ Rincon. This site for Paragliding and Hang Gliding is the only coastal soaring site in Carpinteria and the best location for consistent soaring conditions between San Diego and San Francisco. This Cliff site is cherished by residents, tourists, and pilots alike. It deserves to be preserved.

Thank you,

Willy Dydo

Nick,

I am horrified to hear that the Bates/Rincon paragliding launch is in jeopardy.

I travel to Carpinteria at least once each year to fly this incredibly rare site. I often stay in Carpinteria for up to 10 days at a time to get my annual "paragliding fix." I've been doing this for the past 20 years.

I have reviewed the proposals for a bike/walking trail and strongly urge you to consider locating the path along the highway. There is plenty of opportunity for walkers/bikers to experience the beauty of the ocean view, even with this half-mile "detour."

If this site is ruined by this proposed path, I will simply drive through Carpinteria and make my way to Seaside/Monterey to fly there, spending my roughly $2500 vacation money elsewhere.

Such sites are rare and once destroyed, they can never be brought back. Please think long-term, from both an outdoorsman's perspective and an economic perspective.

Thank you.

Andrew Craig, Fredericksburg VA 540-244-0744

- What Bates means to you and why the ridge should be preserved
- Why the EIR needs to assess impacts to wind and recreation

- Why the City should consider alternat ***Put the proposed trail along the highway and save money while preserving our precious paragliding site. I travel there at least once a year to paraglide and spend a lot of money in Carpinteria. If the site is gone, so am I. Andrew Craig, Virginia BATES RINCON BIKE PATH, 11/17/2020***

- ives like the North side of Bates.

Hey Nick,

Just emailing to reiterate why I don't support the proposed new bike path at Rincon.

1. It's going to ruin flying at a historical, frequently used, well loved free flight location
2. It's going to feed cyclists into a super unsafe parking lot with a steep grade at the end
3. It would be way more affordable and have less of an environmental impact if the path was just built along the highway.

Thanks,

Angela

Nick Bobroff,

HI Nick, I'm a visiting pilot that purposely came to the Santa Barbara area to fly paragliders. In doing so I found an awesome little town called Carpinteria. Has it not been for flying I would have never stumbled upon it. Long story short, please consider revamping the bike path plans.

Thank you,
Andrew from OhIo

Hi Nick, hope your leisure life is more pleasant than dealing with this battle.

The EIR sales pitch by design paints a pretty picture but leaves out the fact that paragliding and hang gliding will be lost with this project at this site.

Please keep in mind that paragliders and hang gliders are a sanctioned aircraft and activity by the Federal Aviation Administration (FAA). We are breaking no rules by flying in this airspace. There are no FAA regulations about flying near trains, railroad tracks, bicycles, freeways or transportation corridors. Even the Rincon Park rule of no landing in the park would not hold up in a court of law as we are legally allowed to land there according to the FAA rules.

It does not matter if we launch from la cumbre peak, the beach, the bluff in the park, the privately owned bluff, off the top of my friends building, rincon mountain, etc, that it is 100% legal to fly in that airspace and only the FAA can decide otherwise.

We look forward to a complete impact report. Thanks for considering alternatives. Call if you want to chat.

Hi Nick,

Biking is just as important to me and many others as paragliding. The has been a free soaring site for a long time. We as a community are asking not that you stop the bike trail but that you find a way to keep the flying site and construct the bike path. There is a way, but once the flying site is destroyed it will never be the same.

Thank you for your time and consideration,

Drew Quine

Hello,

I have been driving to the Santa Barbara area for paragliding for at least two weeks a year for the past 10 years. I stay at the hotels and eat at the restaurants. I love flying the area and the Bates soaring site is one of my favorites. The wind hits the hillside and makes a perfect flying site….taking advantage of frequent wind directions…making it a perfect alternative when other sites are not flyable.

Flying is a lot like surfing….you need very special terrain conditions to make it work….and Bates works.

I also ride a bicycle a lot. I love riding. However there are thousands of miles of great cycling routes and only a select few flying sites.

Why destroy a very special site in order to make a path for bicycles? Can't we be creative and design something that works for both?

I'm truly surprised at a bicyclist wanting to destroy a flying site.

I'm wondering if there is someone else ….someone who stands to make a lot of money moving dirt around who is pushing this….it can't be coming from cyclists.

Please consider some alternative to destroying Bates for flying.

Thankyou for listening.

Good afternoon,

The ridge above Rincon Beach is a world class short ridge flight for paragliders. The current bike path plan would destroy the launch area, making flights there no longer possible. My spouse and I traveled from Colorado to be able to fly Bates and other sites in the region. I humbly request that you take the interests of paragliders into consideration with these plans. It would be heartbreaking to hear Bates was destroyed.

Thank you,
Becky Higbee

Re: Focused EIR for the Rincon Trail project

My name is Brian Nash and I reside at 6508 Camino Carreta. I am writing to you today with the purpose of giving my support to the Rincon trail project. As a 40-year resident of the city I have participated in numerous local projects including the community pool, Bluffs 1&3 and the proposed skate park. I believe that this project of connecting the city with the Rincon park via this bike path will be accretive to the residents and to the visitors of the area.

The current situation with bicycle riders using the highway or Bates road is simply dangerous. I drive to Rincon park daily via Bates road and observe the riders using good manners but the lack of shoulder gives them and motorists little room for error.

The opponents to this project are primarily from the Paraglider community. They use the parcel owned by King Ventures as their launching point. They apparently feel that their interests outweigh the interests of the rest of the community. I understand that they believe that this project will have detrimental effects on their ability to sail. The current geography that enables them to get the lift they require is not natural but rather man made from the time the original railroad line was bluff side. Since that time the railroad was moved, the current highway built and the old highway abandoned.

I want to be clear that I have no vendetta against the gliding community, however I do have issues with the logic that they are using. They are using private property to launch from and when the owner comes up with a plan to develop this parcel they will be forced to launch from an alternative site. They claim that this geography is natural and it clearly is not. They are looking at this project from their lens as it pertains to now and not looking forward to the future.

The legacy projects that have been accomplished in this community are amazing and this project of connecting the city to the Rincon park would be icing on the cake.

Respectfully submitted,

Brian Nash

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Hi Nick,

We are in the process of preparing comments on the NOP of an EIR for the Carp Rincon Multi-Use Trail Project. I was hoping to get a little more information on proposed equipment and duration of its use so that we can determine potential regulatory requirements for this project.

Is it possible to find out the anticipated timeline for the bridge construction/installation portion of the project? The total project duration is two years, but unclear how long the bridge portion may take. I ask because I'd like to determine how long the two cranes could be used/located onsite for this project.

Also, if it's possible to get more detail on the cranes that might be used, that would be helpful, but I understand if those specifics may not be nailed down yet.

Thanks,
Carly

Subject: Rincon trail concerns

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

To, **City of Carpinteria Community Development Department**

I have been a Santa Barbara resident for the past 17 years, as well as the sole proprietor of my own business, and a career staff member of the UC Santa Barbara Department of Recreation. I am also an outdoor recreation enthusiast who frequents the many hiking trails and bike paths of South Santa Barbara County, and Ventura County. You may remember me from my original message to you back in December of 2019, regarding my concerns about the proposed Rincon Multi-Use Trail project.

First and foremost, although I strongly agree that a multi-use trail should be constructed to provide a safe, economical, and easily-maintainable path for cyclists and pedestrians, I strongly disagree with the currently-proposed plan by the Community Development Department. I believe that the currently-proposed plan aimlessly focuses more on aesthetics than practicality, which is a detriment to the land proposed to be used for the project's construction, and furthermore generates wasteful spending of financial resources, both now and well into the future. Please view my specific points of concern as follows:

- **Unstable seaside slope proposed as a site for the path:** Science has proven that sea levels are rising, storm activity has increased, and both are contributing to the erosion of coastal sea walls, beaches, and cliffs. I believe it makes neither practical, nor economical sense to spend the time and financial resources building and maintaining a multi-use trail next to the sea that will almost certainly be eroded beyond repair within the next decade or two. A more cost-efficient, reliable multi-use path would best be routed more inland, along the highway, and away from the sea.
- **Unsafe routing of path through vehicle parking lot:** I believe it is the Community Development Department's responsibility to be fully accountable for the safety of everyone who would potentially use the proposed path. Therefore, it was disturbing to hear the lack of accountability from the planning committee earlier this year, regarding the traffic and obstacles within the parking lot through which the proposed multi-use path would be routed. A more practical way to address this safety concern is to remove the traffic and obstacles completely from this plan by developing a dedicated path for pedestrians and cyclists, which physically prevents vehicle traffic and most obstacles from impeding the path.

Again, I strongly agree that a multi-use trail should be constructed, but I strongly disagree with the current plan. I implore you to please listen to your local community, and work with everyone to develop a safer, longer-lasting, and more cost-effective product that addresses all concerns. In doing so, I believe that the revised finished product will be the subject of efficiency, appreciation, and comradery for the people of Carpinteria, for many generations to come.

Subject: Save Bates Paragliding

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Hi Nick,

I live in Colorado but visit Santa Barbara to paraglide. It's where I learned, and is one of the best places for the sport in the country. The Bates beach ridge is a world class location for ridge soaring. A bike path is a great addition to the area and would be enjoyed by many, but there certainly must be a way to add a bike path and save this renowned free flying site? Appreciate your consideration and thanks for recieving input from the community.

Cheers,

Caleb Phillips

Hi Nick,

Would it possible for Tess and I to come down for a site visit sometime soon? We don't want to take up too much of your time, but it would great if you could show us the project site and help us get our bearings.

We're available this Friday the 6th in the afternoon or the 13th.
The 9th or 16th are also options.

Thanks in advance!

Thanks,
Ciara

Nick Bobroff, City of Carpinteria
5775 Carpinteria Avenue, Carpinteria, CA 93013
11-23-2020

Dear Mr. Bobroff,

Citizens for the Carpinteria Bluffs supports the development of the Carpinteria Rincon Multi-Use Trail project. It will provide a much needed link from the Carpinteria and Rincon Bluffs to the coastal walking/bike path that now runs from Rincon south to Ventura. However, we do have a concern that the current plan offers no on-site parking, unlike the original plan's inclusion of a small parking lot planned near the intersection of Carpinteria Ave and Highway 150. We anticipate that some bikers will choose to park near that intersection, whether or not there is a parking lot. With the acquisition and improvements at the Rincon Bluffs preserve, it is important to note that the current parking lot proposed is small and intended for preserve use. Perhaps, parking in that area by bikers and hikers may never become a problem, but we suggest that the City include a backup plan to accommodate future parking should that need arise.

One possible remedy in lieu of an additional parking lot might be to offer some on-street parking slots near that intersection and making them slightly longer than usually delineated to safely accommodate bikers as they unload their bikes. In addition, it would be helpful for City planners to make a determination of how many of these larger on-street parking spaces might be possible. A sign at the trailhead encouraging bikers to park at the larger Viola Fields lot also might be helpful.

We look forward to the development and completion of this critical link in our coastal trail system and support the City in its work on this project.

Sincerely,

Ted Rhodes

President, Citizens for the Carpinteria Bluffs

Hi Nick,

To keep it short, while cycling is popular, it can be done nearly anywhere. In a niche sport like paragliding, we have to stand up for our flyable areas since they are shrinking. We are trying to grow our sport in the Santa Barbara area, and nationwide. There is plenty of cycling that can be done here at any time, but flying requires specific geography. To tear down a great, consistent feature like the Rincon bluff would be a shame. Cyclists currently have access to the bike path as is. Wouldn't a barrier on the current highway path be much more cost effective than terraforming a large hill for 1/4 mile of path? I believe alternative plans are definitely worth exploring in this case.

EXTERNAL EMAIL

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Hello Nick, I am a local resident and Santa Barbara County tax payer, and I am contacting you out of concern for the current bike path extension plan as presently constituted. We all know how much the tourist industry fiscally benefits Santa Barbara county. The beaches of Santa Barbara county, particularly Carpinteria State Beach, are a prime resource for Santa Barbara county's tourist industry, and I am sure we would all agree that such a resource should be protected and preserved because of how much it benefits Santa Barbara county.

Likewise the Carpinteria bluffs in the area of Bates Road 101 exit draws paragliding visitors from all over the country and the world because of its unique configuration to the prevailing wind. The bulldozing of the little Diamond Head bluff at the Bates Rd area would destroy a significant part of the topography that allows regular paragliding in that area and as such would have a significant fiscal impact on the Santa Barbara-Carpinteria tourist industry.

What I and other local free-flight pilots are proposing is that instead of bulldozing the little Diamond Head bluff and destroying a precious local resource, you simply relocate the bike path to the mountain side of the bluff and allow paragliding and biking to co-exist in harmony where neither tourist resource is irreparably harmed. I would note that there is a current dirt bike path at the base of the bluff that could be another alternative to the bulldozing of a precious local resource. Simply put, why destroy one invaluable local resource when you can have both, all to the fiscal benefit of Santa Barbara county.

Thanking you in advance for considering this in your bike path plans, Desmond McIntosh

EXTERNAL EMAIL

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Hi Nick,
I am a local resident and paragliding pilot, and I am the VP of Paragliding for the Santa Barbara Soaring Association.

I've made multiple public comments in the various town halls that have been open to public about the Rincon bike path project.

I won't rehash everything I have said about the project past, because my comments are a matter of public record, but I just want to reiterate how important this coastal bluff is to free flight recreation in Carpinteria (and the entire region, really). Removing as much soil as has been proposed would utterly destroy our flying site around the bluff, and would negatively affect soaring birds as well that rely on that bluff to travel along the coast.

The environmental impact review really must include changes to airflow of the project and its impacts on recreation and wildlife. This site is just too important to screw up, and I speak for the entire paragliding and hang gliding community when I say that I hope we can find an alternative solution to the current proposal that will still allow a path for cyclists and pedestrians while still preserving this historic soaring site.

Thanks in advance for your consideration.

Sincerely,
Derek Musashe

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Nick -
My name is Dave Patterson; I am a professor at UCSB and a resident of Santa Barbara.

I'm writing to add my voice to the concerns regarding the future of flying at Bates bluff, as a consequence of the proposed Rincon Trail. I share the concerns of many other local pilots who believe that the proposed work will radically lessen the flyability of the site, which unique in our area and has been used continuously for over 40. I moved to Santa Barbara county a few years ago for work, but only fell in love with the area last summer when I learned to fly here, and flying at Bates Bluff has been a huge part of that. The site is truly a gem - a unique place to appreciate the unmatched peace that comes from silently floating above the ocean in perfect air.

I further believe that there are ways to both provide important bicycle access and maintain the site largely in its current form. I expect you are already familiar with those proposals, but if not they are described in the video at https://youtu.be/SVIdEfWHMpE, made by a local pilot. If nothing else, I strongly disagree with the current Carpinteria Rincon Trail report's conclusion that the proposed project will have no impact on recreation at the site - to the contrary, it will dramatically reduce the flyability of the site. Alteration to the airflow is unambiguously a physical change to the site, just as increased noise or unpleasant smell would be. Please let me know if there's anything I can do to maintain the site in a flyable form.

Thank you for taking the time to consider this matter which is very important to so many of us.

--Dave Patterson

Nick.

Again the EIR has to include the Monarch butterfly habitat in the Eucalyptus trees. The wind will highly effect their WINTER Grounds..
The coastal migratory birds the fly up n down the coast twice a week. That use the ridgeline for lift and staging to fly around the next corner. With "X" amount of lift obtained at the cliff face. That will no longer be obtainable.

The banana farm thats micro climate will no longer be in a Perfect wind shadow. That will no longer grow!

The Coriolis effect the wind will AUTOMATICALLY Happen through the MILLION Dollar homes. Also a Butterfly habitat..

The fact is. Endangered species like the Monarch is a Priority.
The same with the growth on the front of the hill. That us being destroyed.

Those plants cannot be TOUCHED OR TRANSPLANTED under law!!!!

Even California condors come to the face every winter. It is the end of their feeding flight line. That will not allow them to soar and return to La Concheta an back to the Fillmore habitat..

These endangered spices need to be involved. As does the banana farm etc.

Good Morning.

In the preceeding meetings there was blatant disregards for endangered species whether animal or plants.

The Monarch butterflies the WINTER in the Eucalyptus trees behind the proposed path. That will NO LONGER allow safe harboring in the trees with such high wind blowing thru them! Caused by changing the slope of the hill.
The FEDERAL and STATE laws ignored of Migratory spices.
Birds. Butterflies. Raptors. CONDOR'S.
That all frequent the area. That use the ridge lift to continue there journey.
The Endangered plant life that cannot be LEGALLY cut, moved, or touched.
All protected by federal law, CA Costal commission etc.
The air flow change alone, will put enormous amount of wind through the MILLION DOLLAR homes. On the point.
The 1 an only place bananas grow along the coast will be greatly Affected!!! Potentially destroying the crop an farm. That grow in a perfect wind shadow. Caused by the bluff. That is being proposed to change!!!
The path is NOT ADA Compliant!
It cannot be done with the Enormuse slope thru the Parking lot!
The original path has the SAME SLOPE issue.
It will never be connected with a 100 million dollar bridge and rework of the WHOLE path!

These issues are beyond ignorent.

I know the little white book of rules.
Dealt with million dollar fines building 2 new hospitals in Ventura! Approx 18million in fines. For the 6million you are fighting to get!

Perhaps one needs to look at the bigger picture!
Do we as citizens want to do LEGAL Battle with all the above societies. An protected under federal law plants an wild life.

I hope the E.I.R. Has real people involving these issues being TRULY Addressed. Not swept aside with blatant disregard.

Although I cannot attend the Zoom meeting as I will be with patients that day/time.
I hope this is READ and brought to All peoples attn.

The British Standards Institution is incorporated by Royal Charter.

This email has been scanned for all known viruses.

Thank you for giving me the opportunity to speak. My name is George Jimenez.

I've lived in Carpinteria for over 60 years. As a member of the Santa Barbara Soaring Association and long- time Carpinteria resident I strongly object to Rincon Trail Project as proposed.

Listed below are my objections to the current Rincon Trail plan and suggestions to implement the Rincon Trail so all can enjoy [redacted] including para and hang gliders.

1. The City of Carpinteria and the Coastal Commission should look at alternative routes for the proposed Rincon Trail Project. Building a path along the freeway corridor is one possible alternative solution.

2. Following the existing bike path route to Muscle Shoals beside the 101 freeway is less destructive to nature and the local topography. It makes sense to construct the Rincon Trail for cyclists and hikers and preserve the Paraglider and Hang-glides flying site. It is a less costly alternative.

3. The alignment of the wind and the cliff at the Rincon site provides an ideal flying site. It's the only place between San Diego and San Francisco with a lift so paragliders can fly long distance from this spot.

4. As proposed, The Rincon Trail Project takes the airflow and changes the wind current, rendering the Paragliders Carpinteria flying ridge site destroyed. Our sport recreation opportunity would be taken away. I strongly object to losing our flying site

5. Cyclists, hikers and Paragliders can co-exist. There is no reason for the Rincon Trail Project to take our wind. We can all share the same space and enjoy our sport.

6. Thousands of Paragliders have flown from the Cliffs above the proposed Rincon Trail Project for over 50 years. To abolish the recreational activity and sport of Paragliding completely disregards a segment of the population. The Santa Barbara Soaring Association has over 500 members. Many live in or near Carpinteria and fly along the cliffs above the Rincon frequently. Destroying Paragliders flying site does not provide recreational opportunities for all.

7. As proposed, the Rincon Trail endpoint dangerously places pedestrians and cyclists onto an overloaded, ADA non-compliant parking lot. The project needs to be re-designed for pedestrian and cyclist safety.

8. Please preserve the Paragliders flying site in perpetuity. Preserve the integrity of the landscape, and lesson the amount of dirt extracted from the Rincon Cliffs.

9. This project destroys the natural contour of these cliffs and displaces nature. Carpinteria needs to build a Rincon Trail that includes hiking, biking and Paragliding and doesn't disturb nature especially Environmentally Sensitive Habitat Areas. (ESHA) Please, preserve the environment and habitat area for wildlife.

In closing, Carpinteria City needs to work with the Paragliding Community to find a win-win solution so all can enjoy the Rincon Trail Project.

We've provided the city with a video outlining our need to retain the flying site and how the currently proposed Rincon Trail project would destroy our flying site.

I would like to Thank you sincerely for hearing the voices of the Paragliding community.

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Dear Nick,

I have concerns about the Rincon Trail Bike Path. It will ruin flying at Bates, and haphazardly and only temporarily link the existing bike paths.

Alternative routes and solutions exist that would satisfy all recreational users. The current design expands access to cyclists at the exclusion of free flyers. The construction of this 0.2 mile section does not need to result in the utter deconstruction of the only soaring site in Carpinteria.

This Project needs to be reassessed from the perspective of the very groups it's trying to help.The current design is focused on providing a “blue ocean view” rather than a safe, useful, long-lasting solution.

- The current design will not last long; a railroad and highway have already failed, and we may reasonably assume that any additional projects along this eroding seawall will face a similar fate.
- The current design is not safe; linking the bike paths, but then dumping cyclists into a congested and incredibly steep Rincon Beach parking lot belies the planning and human resources that are going into this project.

I'm also in support of Planners reassessing the faulty logic that underpins the plan to take 156,000 tons of dirt away, to make the remaining dirt stay. Free flight does not require alteration to the existing natural environment, and the scope of the EIR ought to address ways to avoid massive earthwork at this site.

Thank you for your time and consideration.

Sincerely,
Jamie Bishop, Santa Barbara Soaring Association member

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Dear Nick,

I'm forwarding on my comments from this evening's scoping meeting.
Consider the history of recreation other than cycling along the bluffs. The proposed grading would destroy the site for free flight.

Consider cyclist safety. The current design dumps southbound cyclists down a steep grade, into a heavily used parking lot. The majority of cyclists and particularly those commuting by bike would gladly forgo an ocean view for 2 tenths of a mile for a safer ride.

Consider the points at which the new bike path links up with the existing bike paths. A parking lot ought not to be the top location in which to do so.

Consider the natural forces that act on the coastline. The coastline is subject to erosion, and other public projects have washed away. Despite that history, the planners would remove 94,000 tons of dirt and add 3 more drainage vias.

Consider responsible stewardship of natural resources. The proposed route seems entirely inconsistent with Carpinteria's track record. The proposed route is illogical, needlessly expensive, destructive to the natural environment as well as free flight - and it would be ugly.

Consider whether anyone stands to gain, i.e., from a contract, for the removal of 94,000 tons of earth, versus the vastly more economical, and logical solution of extending the bike path along the wide shoulder of the 101 or somewhere along the north side of the bluff. Consider potential conflicts of interest.

Thank you,
Jamie Bishop, SBSA member

Subject: Bates bike path project

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Hi Nick,

I wanted to voice my concerns around the current plans for the bike path that passes through the Bates area.

As a member of the Santa Barbara Soaring Association (SBSA) I am in full support of the much needed bike path, however, I oppose the current project design because it displaces 156,000 tons of soil from the natural environment and destroys the unique geographic features that have made Bates a treasured recreational facility and world-renowned soaring site for the last 40 years. We are asking the City to redesign this 0.2 mile bike path so that it is inclusive of all users and preserves the flying potential of the area.

1. Paragliding and Hang Gliding are official sports that have been fully established at Bates for over 40 years. Bates uniquely combines Southwest facing terrain with prevailing channel winds, allowing airflow to hit the ridge like the swells hit Rincon Point. It is the only coastal soaring site in Carpinteria and the best location for consistent soaring conditions between San Diego and San Francisco. This recreational airpark is cherished by residents, tourists, and pilots alike. It deserves preservation with the City.

2. Bates is a coastal gem that allows small groups like ours to use the same natural resources for recreation as the local bikers, surfers, beachgoers, and joggers. The current design runs counter to this sentiment: the bike path expands access to one group at the exclusion of another. While bikers and joggers have many miles of recreational paths to access, the construction of this 0.2 mile section will drastically impact wind flow, ending free flight for many members of the soaring community and ruining the only soaring site in Carpinteria.

3. The scope of the EIR should address ways to avoid massive earthwork at this site. The Certified Santa Barbara County Coastal Land Use Plan adopted in 1982 states "recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment...shall have priority over uses requiring substantial alteration". According to this guidance, free flight at Bates should have priority over this massive earthwork Project because our recreational uses do not require alteration to the existing natural environment.

4. The current design is focused on providing a “blue ocean view” rather than a safe, useful, long-lasting solution. There is no plan for maintaining this bike path after it's constructed on a 100 year old eroding seawall, where a railroad and highway have already failed. There is also no plan for managing traffic in the already congested and incredibly steep Rincon Beach parking lot where the bike path terminates. This Project needs to be reassessed from the perspective of the very groups it's trying to help.

5. I request project alternatives that preserve the ridge at Bates. A possible option is constructing the Bike Path

on the Northside of the ridge, either along the highway or on the North side of the highway. The use of barriers along the highway shoulder, for example, would be consistent with the bike path design that exists from Rincon to Ventura, and would be more cost effective while preserving the natural environment.

Please ensure the EIR includes and investigates the current impact to our sport as well as to the flow of the wind that supports our flying.

Sincerely,
Jon Blake

Is this the same project for which the city previously argued that an MND was sufficient? Is the city now taking the position that a full EIR is required? What changed since the Planning Commission voted to approve the MND?

John

Hi Nick,

I remember the planning commission meeting where there were many public comments from "soarers," but the commission recommended against re-doing the EIR for the adjustments to the trail design. Did city council decide differently? Will this affect the timing of construction, and thus the ATP funding?

Thanks,

Joey

Hi Nick,

I appreciate your team's work on this project. As an avid cyclist and paraglider, I am hopeful that an alternative design can be engineered that meets the needs of all recreational users. I moved from Boston to Carpinteria for the biking, but I stayed for the flying because it's what makes Carpinteria truly special and unique. I feel the scope of the EIR should cover the items below in order to preserve what I deeply value in this City, and what many others care about too.

1. CEQA considers all recreational uses to be valid if established. Paragliding and Hang Gliding are official sports that have been fully established at Bates for over 40 years. This recreational airpark is cherished by residents, tourists, and pilots alike. In the MND hearing, our qualified experts stated that the Rincon Trail Project will have a significant impact on this established recreation. Additional engineering data can be generated with modeling, similar to how structures are tested for wind loading.

2. The EIR should evaluate wind flow impacts, not just for pilots, but also for soaring birds and insects. The unique geographic features that make Bates a special flying site also make it essential for coastal animal life including pelicans, gulls, and butterflies. Animals use this corridor for transportation just like we do, connecting the Bates Ridge back to the bluffs behind, soaring winds from Carpinteria to Ventura and beyond. Appropriate environmental conservation groups should be notified and consulted.

3. CEQA considers all recreational uses to be valued equally. The current design runs counter to this criteria: the bike path expands access to one group at the exclusion of another. While bikers and joggers have access to many miles of recreational paths, the construction of this 0.2 mile section will ruin the **only** soaring site in Carpinteria, significantly impacting the recreational use of countless pilots. The EIR needs to assess alternatives that avoid this impact and equally accommodates all existing and proposed recreational users.

4. The scope of the EIR should evaluate ways to avoid massive earthwork at this site. The Certified Santa Barbara County Coastal Land Use Plan asserts that "recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment...shall have priority over uses requiring substantial alteration". According to this guidance, free flight at Bates should have priority over the current proposal to displace 104,000 CY of material because our recreational uses do not require alteration to the existing natural environment. The proposed project design is significantly damaging to the coastline, infringing on the Coastal Act, while excluding current recreational users. Alternatives that avoid cutting into Bates ridge should be considered, and if these are rejected, then substantial mitigations should be implemented through the EIR to account for the massive amount of earthwork.

5. The EIR should evaluate alternatives that better serve users. The current design is too focused on providing a “blue ocean view” rather than a safe, useful, long-lasting solution. There is no plan for maintaining this bike path after it's constructed on a 100 year old eroding seawall, where a railroad and highway have already failed. There is also no plan for managing traffic in the already congested and incredibly steep Rincon Beach parking lot where the bike path terminates. This Project needs to be reassessed from the perspective of the very groups it's trying to help.

6. The EIR cannot rely on a statement of overriding consideration because alternatives clearly exist. A possible option is constructing the Bike Path on the Northside of the ridge, either along the highway or on the North side of the highway. The use of barriers along the highway shoulder, for example, would be consistent with the bike path design that exists from Rincon to Ventura, and would be more cost effective and easier for cyclists to use, while preserving the natural environment.

I've also attached a letter from the Santa Barbara Soaring Association (SBSA) that was submitted to City Council in August as a response to the MND decision. As stated at the MND hearing, we have a number of experts willing to provide testimony or technical support, including geotechnical engineers, FAA specialists, and CEQA land use attorneys. We look forward to participating in the EIR. We're not trying to cause issues, we're trying to help.

In conclusion, I am in full support of the much needed bike path, however, I oppose the current project design because it displaces 104,000 CY of soil (approximately 156,000 tons) from the natural environment and destroys the unique geographic features that have made Bates a treasured recreational facility and world-renowned soaring site for the last 40 years. I am asking the City to redesign this 0.2 mile bike path so that it is inclusive of all users and preserves the flying potential of the area.

Please consider project alternatives that avoid cutting into Bates ridge and work to achieve no impact to free flight recreation, with corroboration from scientific evidence and expert testimony.

Thank you,
Jeff Longcor
Carpinteria Resident
Biker & Paraglider

August 21, 2020

RE: Concerns Regarding the Rincont Trail Project

To the Carpinteria City Council Members,

The Santa Barbara Soaring Association (SBSA) is submitting this official letter to members of the City Council in the interest of working together to minimize the impact of the Rincon Trail Project. We are in full support of the much needed bike path, however, the current design virtually eliminates coastal soaring in Carpinteria, destroying a treasured recreational facility.

We're sending this letter in response to the MND determination made on January 6, 2020. We initially delayed transmission in order to respect the difficulties caused by Covid-19. Our hope is to use this letter in lieu of a legal appeal to convey our concerns and demonstrate our willingness to collaborate with the City and public. We are asking the City to help us implement design changes that will preserve airflow along Bates ridge and allow continued use of this widely-celebrated flying site. Bates is visited by countless pilots from around the world. It would be tragic to lose this special place because 0.2 miles of bike path couldn't be routed elsewhere.

Paragliding and Hang Gliding are established sports that have been happening regularly at Bates for over 40 years and are fully established there. It is the only coastal soaring site in Carpinteria and the best known site with consistent soaring wind between San Diego and San Francisco. Unique geographic features combine Southwest facing terrain with prevailing channel winds, allowing airflow to hit Bates ridge like the swells hit Rincon Point. This is a recreational airpark that attracts visitors from afar and deserves preservation with the City.

Our local group of 500 members is concerned the MND was rushed to avoid our inclusion. Those attempting to participate early in the Project were told it did not concern us. While this was true for the previous designs, the current proposal will significantly impact our recreational site. We were surprised to hear of this latest iteration when it was announced in November 2019, especially because the City's website still carried the outdated Alternative Proposal.

It's difficult to understand the City's lack of outreach given that the MND includes a photograph of a paraglider flying over the project site. Our frustration with this treatment is evident in the public comments of Appendix E in the MND. To push this Project past our group, last minute changes were made to the Proposed Final MND (Exhibit 2) for the purpose of denying CEQA consideration, disqualifying free flight as a form of recreation, and bypassing the EIR. These changes included inaccurate statements that we have addressed in the attached Appendix.

We are fortunate to live in Carpinteria, a place where many land uses coexist. This is especially true at Bates. This coastal gem creates pockets of diversity where small groups like ours can use the same natural resources for recreation as the local bikers, surfers, beachgoers, and joggers. The current Project design runs counter to this sentiment: the bike path expands access to one group at the exclusion of another. While bikers and joggers have many miles of recreational paths to access, the construction of this 0.2 mile path will likely end free flight for many of the soaring community members and ruin the only soaring site in Carpinteria.

Additionally, the Certified Santa Barbara County Coastal Land Use Plan adopted in 1982 states "recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment...shall have priority over uses requiring substantial alteration". According to this guidance, free flight at Bates should be given priority over this Project because our recreation requires no alteration to the existing environment.

We would like to challenge the City to design a Project that is inclusive of all users and that avoids ruining this 40-year flying site. This is the one place in Carpinteria where we can pursue our passion and practice our craft, sharing the joy of free flight with residents and tourists alike. Please consider Project alternatives that avoid cutting into Bates ridge and work to achieve no impact to free flight recreation, with corroboration from scientific evidence and expert testimony.

We look forward to building a bike path that meets everyone's needs. Rather than creating conflict around this Project, SBSA is focused on working with the City to find solutions. We have nationwide resources to support these efforts, including our membership with the United States Hang Gliding and Paragliding Association (USHPA). Please contact us to review next steps using the email addresses provided. Thank you for considering the importance of this matter.

Sincerely,

Appendix

Corrections to the Proposed Final MND

Appendix:
Corrections to the Proposed Final MND

1. Inaccuracy #1: free flight at Bates is an unsanctioned activity (p.133)
    a. We legally fly in this airspace as a recognized group by the Federal Aviation Administration (FAA) and United States Hang Gliding & Paragliding Association (USHPA). We have federal permission to use this airspace.
    b. Paragliding and Hang Gliding have been happening regularly at the Bates bluff for over 40 years and is fully established in this location. It is the only coastal soaring site in Carpinteria and the best known site with consistent prevailing wind soaring between San Diego and San Francisco. Unique geographic features combine Southwest facing terrain with channel winds, allowing airflow to hit Bates ridge like the swells hit Rincon Point.
    c. Bates is special in allowing cross country flight. The Project site generates lift that allows pilots to transition to the surrounding bluffs and travel dozens of miles along the coastline, making this activity suited to the “transportation corridor”.
    d. Exhibit 2 lists official rules governing free flight while also claiming it’s an unrecognized recreational activity. This is an obvious contradiction resulting from the City’s selective use of the term “unsanctioned” to fit their needs. How do activities become publicly recognized? Are bikers or surfers sanctioned? No guidelines or examples are provided to address a shared space like Bates.
    e. Exhibit 2 states there are safety hazards regarding the freeway and UPRR, yet no evidence is provided. No free flying accidents have occured in these areas. Meanwhile, the MND has no mitigation plan for the significant impact of bike traffic in Rincon Park caused by the Project. This congested area is already the site of numerous collisions that regularly occur between bikers and vehicles.
    f. Exhibit 2 states that flying at Bates is questionable because foot traffic across the UPRR is restricted. However, pilots are not crossing the tracks by foot and there are no airspace restrictions around the UPRR.
    g. FAA officials and career airline pilots provided expert testimony during the MND hearing to confirm that no aviation rules are being violated at this site.

2. Inaccuracy #2: the preferred launch site disqualifies free flight from CEQA (p.134)
    a. The Rincon Trail Project has no bearing on the current launch locations, it is outside the scope of the project and irrelevant to the MND.
    b. The ownership status of the launch location parcels is subject to change before, during, and after the project, and should not factor into the MND.
    c. Pilots have the capacity to launch from public and private locations to arrive at Bates, at times flying from National Forest property, but can only soar Bates ridge if the existing geological features remain within this unique recreational facility.
    d. On rare windy days, pilots launch from the county property portion below the bluff, which is not in the Rincon Beach County Park or any private property.

e. The Certified Santa Barbara County Coastal Land Use Plan adopted in 1982 states "recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment...shall have priority over uses requiring substantial alteration". According to this plan, whether the land is public or private, free flight at Bates should be given priority over this Project because our recreation requires no alteration to the natural environment.

3. Inaccuracy #3: the Project will not have a negative impact on uplift and airflow (p.135)
    a. During the Public Workshop and the MND hearing, SBSA provided expert testimony and evidence from engineers and FAA officials to substantiate the Project's negative impact on uplift and airflow.
    b. SBSA created a video describing in detail how the Project will drastically affect airflow. This video was provided to the Planning Commission and City Employees, and discussed at length during the MND hearing: https://www.youtube.com/watch?v=SVIdEfWHMpE&t= .
    c. Despite SBSA's efforts, Exhibit 2 states that the flying community has not provided evidence of negative impact. This assertion is made without acknowledgement of what SBSA already provided and without explanation of what more is needed. Additionally, the City fails to share the burden of proof. If a study of scaled models is required to demonstrate the before and after conditions of wind deflection, the City should take responsibility for gathering this data.
    d. The City should be responsible for proving that this Project will not change airflow and will be inclusive of all current users. Where is the proof that this project will not ruin a treasured flying site that has been lovingly used for decades?
    e. Exhibit 2 claims that the Project will not have a negative impact on airflow. No expert testimony, data, or evidence is provided. It also appears that Exhibit 2 confuses our sport with parasailing, which is a separate activity involving a boat. How can the City make assertions without even knowing the name of our sport?
    f. Exhibit 2 states that the Project will improve uplift, yet no scientific proof is provided. Wind gradient models are readily available online and SBSA is willing to further demonstrate how uplift is less productive at lower elevations and severely disrupted by benches like the two proposed for this Project. Below are two online articles that speak to soaring dynamics in areas of ridge lift.
    Ridge Lift Research: http://journals.sfu.ca/ts/index.php/ts/article/viewFile/608/571
    Ridge Soaring: https://chessintheair.com/what-conditions-produce-good-ridge-lift/
    g. Exhibit 2 wrongly suggests that uplift is equal across all seaside bluffs in the area. While pilots may launch from a lower bluff, rarely is there enough uplift to sustain flight. Pilots immediately transition to the Bates ridge, which has a steep, unobstructed face that generates adequate lift in a wide range of wind conditions.
    h. The Project will cause permanent damage to a unique, treasured flying site, yet there are no assurances it will withstand rising sea levels and increased storm activity on the unstable slopes where it's being proposed. The MND has not

demonstrated compliance with the Carpinteria Rising Sea Policy and does not account for long term maintenance or provide a plan for preventing eventual slope failure, which has already happened for the old railroad and highway.

i. The City has not provided evidence of exploring a North Side alternative on either the North or South sides of the highway. This approach would satisfy all potential end users and potentially save costs. If not for the blue view directive, this project could be replaced by a line of barriers along the 101 South to protect bikers between exits.

Hi Nick,

When you get a chance, please send a link or file transfer information for the zoom recording of the EIR Scoping meeting. I know George and others may have already requested this, but I haven't seen it come through in any prior emails.

Also I wanted to make sure this video is part of the EIR Scoping as it addresses recreational issues and suggested some alternatives and mitigations, while perhaps being readily accessible for viewers.

To whom it may concern my name is Jay Plaehn I attended the public Carpinteria meeting regarding altering the Bates bluff. It is a matter of public record that my testimony before the council and many other concerned pilots from the Santa Barbara Flying Association and independently were voiced. Many of these concerns and warnings were also publicly reported in one of the local Carpinteria newspapers shortly there after further confirming testimony and further publicly documenting the concerns of many local citizens. My testimony before the council focused on the fact that Bates point is a highly sensitive geological region where wind patterns affect the micro climate north and south of the point. It is known that this micro climate provides growing conditions that allow certain plants to be farmed and grown in La Conchita. As in bananas for example, one of the few, if not the only place in California as is locally thought. Given this specificity of environmental factors there may be other plant or animal life or insects as in migrating butterflies that could be affected by altering the wind patterns, temperature and the local environment with massive earth moving. It is not unreasonable to expect that the law be followed and a proper and complete environmental study be made. This is what the law was meant to apply to as in the Bates Point. Bates Point is the definition of a micro climate. Please include my concerns in any formal review of the situation. Thank you for your considerations. Jay Plaehn

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Hi Nick,

Thank you for the opportunity to provide input for the EIR that is required for the proposed Carpinteria Rincon Multi-Use Trail. Please include this in the record.

1 The current plan has no information on alternative plans for the path other than to mention that previous version had land slide issues. Without detailed cost data on other possible routes, such as following the freeway and using existing structures, the EIR would be incomplete.

2 With the high tides and storms that are predicted to erode the bluff due to climate change, a plan to have a path on the ocean side of the bluff that will fail within the next 40 years is would be an expensive mistake without the **most current data** on the potential for serious erosion.

3 The plan to terminate the path onto steep and busy parking lot after going through all the effort to make it ADA compliant makes no sense when there are safer alternatives. Alternatives that need to be in the EIR.

4 The plan will permanently destroy an extremely rare and valuable existing recreational resource--- the bluff for soaring gliders. **There is no mitigation possible for this significant loss; therefore the project as it is currently proposed should be terminated ASAP. The regulatory entities needed for approval will never sign-off on this when they see how illegal and ill-conceived it is.**

5 **IF** more time and money **IS** to be spent on an EIR for the current plan, then the value of the bluff for soaring hang gliders and paragliders would need to be a significant section of the EIR. The need for wind tunnel testing on the planned reduced slope and angle of a 3D model of the bluff would probably not be necessary because the proposed change in the ability to soar the bluff would be significant enough to be easily calculated on paper using common wind-flow data and formulas.

It is great to see that an EIR will be used in the process. It will likely be less expense to produce a comprehensive EIR than to have the city defend a lawsuit from the Glider pilots. The fact that the pilots were so blatantly left out of the process raises questions that have yet to be answered. Did the planers really think that the soaring would not be affected? Did long small town personal conflicts create a plan that will likely never be permitted?

Subject: Notice of Preparation (NOP) for Carpinteria Rincon Multi-Use Trail Environmental Impact Report (EIR)

The City of Carpinteria has released a Notice of Preparation (NOP) for an Environmental Impact Report (EIR) for the Rincon Multi-Use Trail project.

The City is soliciting comments from the public concerning the contents and analysis to be considered in the EIR for the proposed project. The scoping comment period will run from October 30, 2020 to November 30, 2020 at 5:00 p.m. A virtual public scoping meeting will be held online on Tuesday, November 17th at 4:30 p.m. via Zoom Webinar. Information on how to attend the virtual scoping meeting is included in the NOP.

The Notice of Preparation and detailed project description are available on the City's Rincon Trail project webpage at:
https://carpinteria.ca.us/public-works/engineering-division/rincon-multi-use-trail/
A copy of the NOP and project description is also attached to this email.

Should you have any questions about the proposed project or this NOP, please feel free to contact me.
Thank you,
Nick Bobroff, Principal Planner
Community Development Department

Hi Nick,

My name is Kevin Carter and I am a pilot. Since 2003 I have been travelling to the Santa Barbara/Carpinteria area in the winter months to fly and recreate. It saddens me to see one of the few accessible flying sites face an unnecessary demise, especially when an alternative exists that would allow all of the desired types of recreation. As an avid cyclist, rollerblader, pilot, etc I embrace all efforts to increase recreation access but as a pilot I know that access to viable flying sites in America is far more difficult to obtain and maintain then for other activities. It is ironic that flying site access is the primary and only reason I travel to your area, but now the reason that I am contacting you to voice my opinion.

Thank you for your time and consideration,
Kevin

To Whom It May Concern,

We are against the initial scope of this project. The hang gliders have been using this space for years, and they bring joy to those of us who watch them sailing over the bluffs and the ocean.

We love to ride our bikes and would appreciate a continuous trail from Carp Avenue to Rincon Beach Park, but NOT at the expense of hang gliders who have enjoyed this spot for decades.

We are concerned that an EIR is not being done; how will this project affect the hillside after steep grading? How will this project affect the local flora and fauna? We understand that there is a safety issue involved due to cyclists using the 101 freeway or rail access; why not encourage them to use Hwy 150 to Rincon Hill Road?

We are hopeful that the Carpinteria Planning Commission will listen to the voices of the soaring community, and to average citizens like us, and reconsider this project, or at least allow an EIR to be done.

Sincerely,
Karen Ensign and Steve Tonnesen

Hello Nick,

I am a member of the Channel Islands Bicycle Club and a frequent bicyclist between Ventura and Carpinteria. I am hoping to join the Zoom NOP meeting this afternoon. However, there is the possibility that a conflict will prevent me from joining. Will the Zoom be recorded and available on your web site?

I am really looking forward to the proposed Rincon Trail project. Rincon Beach is a terrific park and the trail should make the park more accessible to walkers and cyclists from Carpinteria.

My biggest concern is the safe accommodation of the increased numbers of bikes that will be transiting Rincon Beach County Park. The parking lot is already dicey for cars, pedestrians, and bicyclists. The proposed trail should greatly increase the number of bikes. Hopefully S.B. County Parks is engaged and will be planning better routing bikes, peds, and cars through the park.

I plan to submit a letter prior to the Nov. 30 deadline. It will be helpful if I am able to review today's discussion so that I have a full understanding of the proposed Rincon Trail project.

Thanks,
Kate Faulkner

Please accept the suggestion to thoroughly investigate and research the items stated below as part of the Scoping Process within the EIR for the Rincon Trail Project.

To: Dudek Environmental Impact Report Scoping Suggestions

1. City of Carpinteria and the CCC must examine alternative routes on the North side of the Bluffs running parallel to the 101 Freeway.

2. City of Carpinteria and the CCC thoroughly research, the geology of the area and what erosion might be caused in the removal of 100,000 tons of dirt during the construction of this trail which includes bridges, concrete support systems and extensive drainage. How does this effect the stability and also the liabilities of the public falling or injuring themselves on this trail, Who is responsible for those liabilities and what safety precautions can/will be taken to prevent injury to the public?

3. Wildlife habitat,, the presence of ESHA and the overall plant and animal species native to the area should be thoroughly researched and documented. Displacing any of our native California Wildlife must be avoided at all costs. Would the Rincon Trail interrupt/destroy an established wildlife corridor? This question must be answered.

4. The Hang gliders and Para gliders launch pad can not and should not be destroyed. It's is a long established site of over 40 years and one of only three such sites in California where the wind drift allows a launch and long distance flying opportunity. The hang gliders should be included as participants in the EIR process and there must be a serious amount of research and time spent to allow the Hang and Para gliders to keep their recreational activity and their launch spot. This project needs to take the effects it will have on the hang gliders wind, document, measure and the Rincon Trail Project must be modified to not destroy the wind current from the bluffs launch.

5. The aesthetic and majestic beauty of the coastline needs to be preserved and the changes measured as to how this project will effect the view corridor looking down the coast to the Rincon.

6. The current proposal unsafely dumps cyclists, hikers and members of the public into a very congested non-ADA compliant parking lot. Other designs need to be explored to avoid this danger.

Thank-you for the opportunity to submit these suggestion for the Rincon Trail Project. I sincerely hope the preparation of the EIR will take these items in to account as part of the Scoping process.

Respectfully Submitted,

Kathleen Reddington

Subject: Bike path proposal

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Dear Mr. Bobroff,
As you review the proposal to create a bike path in Carpinteria, please consider the impact this would have on paragliding. I am a pilot and frequently visit Santa Barbara in order to fly there. I believe this helps the city's tourism and is a beautiful part of its character that would be a shame to lose.

Please consider finding an alternative proposal that does not destroy the ridge.

All the best,
Katharina Roesler

Subject: Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Carpinteria Rincon Multi-Use Trail, SCH #2020060534, Santa Barbara County

Dear Mr. Bobroff:

The California Department of Fish and Wildlife (CDFW) has reviewed the Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the Carpinteria Rincon Multi-Use Trail (Project). The City of Carpinteria (City) is the lead agency preparing a DEIR pursuant to the California Environmental Quality Act (CEQA; Pub. Resources Code, § 21000 et. seq.) with the purpose of informing decision-makers and the public regarding potential environmental effects related to the Project.

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW's Role

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State [Fish & Game Code, §§ 711.7, subdivision (a) & 1802; Public Resources Code, § 21070; California Environmental Quality Act (CEQA) Guidelines, § 15386, subdivision (a)]. CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect state fish and wildlife resources.

CDFW is also submitting comments as a Responsible Agency under CEQA (Public Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code, including lake and streambed alteration regulatory authority (Fish & Game Code, § 1600 *et seq.*). Likewise, to the extent implementation of the Project as proposed may result in "take" (see Fish & Game Code, § 2050) of any species protected under the California Endangered Species Act (CESA; Fish & Game

DocuSign Envelope ID: F6039B76-FED9-41C6-A223-6C5FF6314CAD

Code, § 2050 *et seq.*) or the Native Plant Protection Act (NPPA; Fish & Game Code, § 1900 *et seq.*), CDFW recommends the Project proponent obtain appropriate authorization under the Fish and Game Code.

Project Location: The Project would extend from the eastern end of Carpinteria Avenue, in the City of Carpinteria, to Rincon Beach County Park, in unincorporated Santa Barbara County. The Carpinteria Bluffs Nature Preserve lies to the east of the Project and the Project is bordered by the Rincon Bluffs Preserve.

Project Description/Objectives: The proposed Project includes the construction of a paved 16-foot-wide trail (10-foot-wide path with 3-foot-wide paved shoulder along both sides); an approximately 2,800-feet-long, a clear-span bridge over the Union Pacific Railroad alignment; parking facilities; fencing; signage; and a storm drainage collection system, with new drain outlets to the ocean. The bridge would be approximately 160-feet-long, with a width of between 14-feet and 16-feet.

COMMENTS AND RECOMMENDATIONS

CDFW offers the following comments and recommendations to assist the City in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources.

Specific Comments

1) Crotch Bumble Bee. Potential for Crotch bumble bee (*Bombus crotchii*) within the Project vicinity. Project ground disturbing activities may result in crushing or filling of active bee colonies, causing the death or injury of adults, eggs, and larvae. The Project may remove bee habitat by eliminating vegetation that may support essential foraging habitat. Impacts to Crotch's bumble bee could result from ground disturbing activities. Project disturbance activities could result in mortality or injury to hibernating bees, as well as temporary or long-term loss of suitable foraging habitats. Construction during the breeding season of bees could result in the incidental loss of breeding success or otherwise lead to nest abandonment.

    a) CDFW recommends that measures be taken, primarily, to avoid Project impacts to Crotch bumble bee. On June 12, 2019, the California Fish and Game Commission accepted a petition to list the crotch bumble bee as endangered under the California Endangered Species Act ("CESA"), determining the listing "may be warranted" and advancing the species to the candidacy stage of the CESA listing process.

    b) CDFW recommends, within one year prior to vegetation removal and/or grading, a qualified entomologist familiar with the species behavior and life history should conduct surveys to determine the presence/absence of Crotch's bumble bee. Surveys should be conducted during flying season when the species is most likely to be detected above ground, between March 1 to September 1 (Thorp et al. 1983). Survey results including negative findings should be submitted to CDFW prior to initiation of Project activities. If "take" or adverse impacts to Crotch's bumble bee cannot be avoided either during Project activities or over the life of the Project, the City must consult CDFW to determine if a CESA incidental take permit is required (pursuant to Fish & Game Code, § 2080 et seq.).

DocuSign Envelope ID: F6039B76-FED9-41C6-A223-6C5FF6314CAD

2) California Endangered Species Act (CESA). A review of CNDDB indicates several occurrences within two miles of the Project vicinity of light-footed Ridgway's rail (*Rallus obsoletus levipes*), a CESA-listed and Fully-Protected species (Fish and G. Code § 3511) that is also listed under the federal Endangered Species Act. A review of CNDDB indicates several occurrences within two miles of the Project vicinity of Belding's savannah sparrow (*Passerculus sandwichensis beldingi*), a CESA-listed species. Project related activities may adversely impact potential habitat for this species. CDFW considers adverse impacts to a species protected by CESA to be significant without mitigation under CEQA. As to CESA, take of any endangered, threatened, candidate species, or State-listed rare plant species that results from the Project is prohibited, except as authorized by state law (Fish and Game Code, §§ 2080, 2085; Cal. Code Regs., tit. 14, §786.9). Consequently, if the Project, Project construction, or any Project-related activity during the life of the Project will result in take of a species designated as endangered or threatened, or a candidate for listing under CESA, CDFW recommends that the Project proponent seek appropriate take authorization under CESA prior to implementing the Project. Appropriate authorization from CDFW may include an Incidental Take Permit (ITP) or a consistency determination in certain circumstances, among other options [Fish & Game Code, §§ 2080.1, 2081, subds. (b) and (c)]. Early consultation is encouraged, as significant modification to a Project and mitigation measures may be required in order to obtain a CESA Permit. Revisions to the Fish and Game Code, effective January 1998, may require that CDFW issue a separate CEQA document for the issuance of an ITP unless the Project CEQA document addresses all Project impacts to CESA-listed species and specifies a mitigation monitoring and reporting program that will meet the requirements of an ITP. For these reasons, biological mitigation monitoring and reporting proposals should be of sufficient detail and resolution to satisfy the requirements for a CESA ITP.

   CDFW cannot authorize the take of any fully protected species as defined by State law. State fully protected species may not be taken or possessed at any time and no licenses or permits may be issued for its take except for collecting those species for necessary scientific research and relocation of the bird species for protection of livestock (Fish & G. Code, §§ 3511, 4700, 5050, 5515). Take of any species designated as fully protected under the Fish and Game Code is prohibited. CDFW recognizes that light-footed Ridgway's rail is documented to occur in the vicinity of the project area. CDFW recommends the City fully avoid all impacts to light-footed Ridgway's rail occupied habitat.

3) Human-Wildlife Interface. Due to the location of the Project site within coastal bluff and beach environment, CDFW recommends the lead agency evaluate the use of this trail and its potential impacts to wildlife in the adjacent open space settings.

4) Biological Baseline Assessment. A CNDDB review indicates the occurrence of several special status insect, reptile, mammal, and plant species including Coulter's saltbush (*Atriplex coulteri*), globose dune beetle (*Coelus globosus*), western snowy plover (*Charadrius alexandrinus nivosus*), Northern California legless lizard (*Anniella pulchra*), white-veined monardella (*Monardella hypoleuca ssp. hypoleuca*),Townsend's big-eared bat (*Corynorhinus townsendii*), southern tarplant (*Centromadia parryi ssp. australis*), and monarch - California overwintering population (*Danaus plexippus* pop. 1) within the Project vicinity. The majority of the Project site is open space. Undisturbed land may provide suitable habitat for special status or regionally and locally unique species. CDFW recommends providing a complete assessment and impact analysis of the flora and fauna within and adjacent to the Project area, with emphasis upon identifying endangered,

DocuSign Envelope ID: F6039B76-FED9-41C6-A223-6C5FF6314CAD

threatened, sensitive, regionally and locally unique species, and sensitive habitats. Impact analysis will aid in determining any alternative trail designs that could reduce impacts to any special status species detected, as well as assess direct, indirect, and cumulative biological impacts. CDFW recommends avoiding any sensitive natural communities found on or adjacent to the Project. CDFW also considers impacts to Species of Special Concern a significant direct and cumulative adverse effect without implementing appropriate avoidance and/or mitigation measures. The DEIR should include the following information:

a) Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region [CEQA Guidelines, § 15125(c)]. The DEIR should include measures to fully avoid and otherwise protect Sensitive Natural Communities from Project-related impacts. Project implementation may result in impacts to rare or endangered plants or plant communities that have been recorded adjacent to the Project vicinity. CDFW considers these communities as threatened habitats having both regional and local significance. Plant communities, alliances, and associations with a state-wide ranking of S1, S2, S3 and S4 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by visiting https://www.wildlife.ca.gov/Data/VegCAMP/Natural-Communities#sensitive%20natural%20communities;

b) A thorough, recent, floristic-based assessment of special status plants and natural communities, following CDFW's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (see https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18959&inline);

c) Floristic, alliance- and/or association-based mapping and vegetation impact assessments conducted at the Project site and within the neighboring vicinity. *The Manual of California Vegetation*, second edition, should also be used to inform this mapping and assessment (Sawyer, 2008). Adjoining habitat areas should be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions;

d) A complete, recent, assessment of the biological resources associated with each habitat type on site and within adjacent areas that could also be affected by the Project. CDFW's CNDDB in Sacramento should be contacted to obtain current information on any previously reported sensitive species and habitat. CDFW recommends that CNDDB Field Survey Forms be completed and submitted to CNDDB to document survey results. Online forms can be obtained and submitted at http://www.dfg.ca.gov/biogeodata/cnddb/submitting_data_to_cnddb.asp;

e) A complete, recent, assessment of rare, threatened, and endangered, and other sensitive species on site and within the area of potential effect, including California Species of Special Concern and California Fully Protected Species (Fish & Game Code, §§ 3511, 4700, 5050 and 5515). Species to be addressed should include all those which meet the CEQA definition of endangered, rare or threatened species (CEQA Guidelines, § 15380). Seasonal variations in use of the Project area should also be addressed. Focused species-specific surveys, conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise

DocuSign Envelope ID: F6039B76-FED9-41C6-A223-6C5FF6314CAD

identifiable, are required. Acceptable species-specific survey procedures should be developed in consultation with CDFW and the USFWS; and,

f) A recent, wildlife and rare plant survey. CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the proposed Project may warrant periodic updated surveys for certain sensitive taxa, particularly if build out could occur over a protracted time frame, or in phases.

5) Biological Direct, Indirect, and Cumulative Impacts. Due to the proximity of the Project site to undeveloped land and open space just north of the Project site, it is essential to understand how these open spaces and the biological diversity within them may be impacted by Project activities. This should aid in identifying specific mitigation or avoidance measures necessary to offset those impacts. CDFW recommends providing a thorough discussion of direct, indirect, and cumulative impacts expected to adversely affect biological resources, with specific measures to offset such impacts. The following should be addressed in the DEIR:

a) A discussion regarding indirect Project impacts on biological resources, including resources in nearby public lands, open space, adjacent natural habitats, riparian ecosystems, and any designated and/or proposed or existing reserve lands (e.g., preserve lands associated with a Natural Community Conservation Plan (NCCP, Fish & Game Code, § 2800 *et. seq.*). Impacts on, and maintenance of, wildlife corridor/movement areas, including access to undisturbed habitats in adjacent areas, should be fully evaluated in the DEIR;

b) A discussion of potential adverse impacts from lighting, noise, temporary and permanent human activity, and exotic species and identification of any mitigation measures;

c) A discussion on Project-related changes on drainage patterns and downstream of the Project site; the volume, velocity, and frequency of existing and post-Project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and, post-Project fate of runoff from the Project site. The discussion should also address the proximity of the extraction activities to the water table, whether dewatering would be necessary and the potential resulting impacts on the habitat (if any) supported by the groundwater. Mitigation measures proposed to alleviate such Project impacts should be included;

d) An analysis of impacts from land use designations and zoning located nearby or adjacent to natural areas that may inadvertently contribute to wildlife-human interactions. A discussion of possible conflicts and mitigation measures to reduce these conflicts should be included in the DEIR; and,

e) A cumulative effects analysis, as described under CEQA Guidelines, section 15130. General and specific plans, as well as past, present, and anticipated future projects, should be analyzed relative to their impacts on similar plant communities and wildlife habitats.

6) Nesting Birds. Project activities may impact nesting birds. Project activities occurring during the breeding season of nesting birds could result in the incidental loss of fertile eggs, or

DocuSign Envelope ID: F6039B76-FED9-41C6-A223-6C5FF6314CAD

nestlings, or otherwise lead to nest abandonment in trees directly adjacent to the Project boundary. The Project could also lead to the loss of foraging habitat for sensitive bird species.

a) CDFW recommends that measures be taken, primarily, to avoid Project impacts to nesting birds. Migratory nongame native bird species are protected by international treaty under the Federal Migratory Bird Treaty Act (MBTA) of 1918 (Code of Federal Regulations, Title 50, § 10.13). Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests including raptors and other migratory nongame birds (as listed under the Federal MBTA).

b) Proposed Project activities including (but not limited to) staging and disturbances to native and nonnative vegetation, structures, and substrates should occur outside of the avian breeding season which generally runs from February 15 through August 31 (as early as January 1 for some raptors) to avoid take of birds or their eggs. If avoidance of the avian breeding season is not feasible, CDFW recommends surveys by a qualified biologist with experience in conducting breeding bird surveys to detect protected native birds occurring in suitable nesting habitat that is to be disturbed and (as access to adjacent areas allows) any other such habitat within 300-feet of the disturbance area (within 500-feet for raptors). Project personnel, including all contractors working on site, should be instructed on the sensitivity of the area. Reductions in the nest buffer distance may be appropriate depending on the avian species involved, ambient levels of human activity, screening vegetation, or possibly other factors.

General Comments

7) Project Description and Alternatives. To enable CDFW to adequately review and comment on the proposed Project from the standpoint of the protection of plants, fish, and wildlife, we recommend the following information be included in the DEIR:

a) A complete discussion of the purpose and need for, and description of, the proposed Project, including all staging areas and access routes to the construction and staging areas; and,

b) A range of feasible alternatives to Project component location and design features to ensure that alternatives to the proposed Project are fully considered and evaluated. The alternatives should avoid or otherwise minimize direct and indirect impacts to sensitive biological resources and wildlife movement areas.

8) Wetlands Resources. CDFW, as described in Fish and Game Code section 703(a), is guided by the Fish and Game Commission's policies. The Wetlands Resources policy (http://www.fgc.ca.gov/policy/) of the Fish and Game Commission "…seek[s] to provide for the protection, preservation, restoration, enhancement and expansion of wetland habitat in California. Further, it is the policy of the Fish and Game Commission to strongly discourage development in or conversion of wetlands. It opposes, consistent with its legal authority, any development or conversion that would result in a reduction of wetland acreage or wetland habitat values. To that end, the Commission opposes wetland development proposals unless, at a minimum, project mitigation assures there will be 'no net loss' of either wetland

DocuSign Envelope ID: F6039B76-FED9-41C6-A223-6C5FF6314CAD

habitat values or acreage. The Commission strongly prefers mitigation which would achieve expansion of wetland acreage and enhancement of wetland habitat values."

a) The Wetlands Resources policy provides a framework for maintaining wetland resources and establishes mitigation guidance. CDFW encourages avoidance of wetland resources as a primary mitigation measure and discourages the development or type conversion of wetlands to uplands. CDFW encourages activities that would avoid the reduction of wetland acreage, function, or habitat values. Once avoidance and minimization measures have been exhausted, the Project must include mitigation measures to assure a "no net loss" of either wetland habitat values, or acreage, for unavoidable impacts to wetland resources. Conversions include, but are not limited to, conversion to subsurface drains, placement of fill or building of structures within the wetland, and channelization or removal of materials from the streambed. All wetlands and watercourses, whether ephemeral, intermittent, or perennial, should be retained and provided with substantial setbacks, which preserve the riparian and aquatic values and functions for the benefit to on-site and off-site wildlife populations. CDFW recommends mitigation measures to compensate for unavoidable impacts be included in the DEIR and these measures should compensate for the loss of function and value.

b) The Fish and Game Commission's Water policy guides CDFW on the quantity and quality of the waters of this state that should be apportioned and maintained respectively so as to produce and sustain maximum numbers of fish and wildlife; to provide maximum protection and enhancement of fish and wildlife and their habitat; encourage and support programs to maintain or restore a high quality of the waters of this state; prevent the degradation thereof caused by pollution and contamination; and, endeavor to keep as much water as possible open and accessible to the public for the use and enjoyment of fish and wildlife. CDFW recommends avoidance of water practices and structures that use excessive amounts of water, and minimization of impacts that negatively affect water quality, to the extent feasible (Fish & Game Code, § 5650).

9) Compensatory Mitigation. The DEIR should include mitigation measures for adverse Project-related impacts to sensitive plants, animals, and habitats. Mitigation measures should emphasize avoidance and reduction of Project impacts. For unavoidable impacts, on-site habitat restoration or enhancement should be discussed in detail. If on-site mitigation is not feasible or would not be biologically viable and therefore not adequately mitigate the loss of biological functions and values, off-site mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed. Areas proposed as mitigation lands should be protected in perpetuity with a conservation easement, financial assurance and dedicated to a qualified entity for long-term management and monitoring. Under Government Code, section 65967, the lead agency must exercise due diligence in reviewing the qualifications of a governmental entity, special district, or nonprofit organization to effectively manage and steward land, water, or natural resources on mitigation lands it approves.

10) Long-term Management of Mitigation Lands. For proposed preservation and/or restoration, the DEIR should include measures to protect the targeted habitat values from direct and indirect negative impacts in perpetuity. The objective should be to offset the Project-induced qualitative and quantitative losses of wildlife habitat values. Issues that should be addressed include (but are not limited to) restrictions on access, proposed land dedications, monitoring and management programs, control of illegal dumping, water pollution, and increased

DocuSign Envelope ID: F6039B76-FED9-41C6-A223-6C5FF6314CAD

human intrusion. An appropriate non-wasting endowment should be set aside to provide for long-term management of mitigation lands.

11) Translocation/Salvage of Plants and Animal Species. Translocation and transplantation is the process of moving an individual from the Project site and permanently moving it to a new location. CDFW generally does not support the use of, translocation or transplantation as the primary mitigation strategy for unavoidable impacts to rare, threatened, or endangered plant or animal species. Studies have shown that these efforts are experimental and the outcome unreliable. CDFW has found that permanent preservation and management of habitat capable of supporting these species is often a more effective long-term strategy for conserving sensitive plants and animals and their habitats.

12) Moving out of Harm's Way. The proposed Project is anticipated to result in clearing of habitats that support many species of indigenous wildlife. To avoid direct mortality, we recommend that a qualified biological monitor approved by CDFW be on-site prior to and during ground and habitat disturbing activities to move out of harm's way special status species or other wildlife of low mobility that would be injured or killed by grubbing or Project-related construction activities. It should be noted that the temporary relocation of on-site wildlife does not constitute effective mitigation for the purposes of offsetting Project impacts associated with habitat loss. If the Project requires species to be removed, disturbed, or otherwise handled, we recommend that the DEIR clearly identify that the designated entity should obtain all appropriate state and federal permits.

CONCLUSION

CDFW appreciates the opportunity to comment on the NOP to assist the City of Carpinteria in identifying and mitigating Project impacts on biological resources. If you have any questions or comments regarding this letter, please contact Kelly Schmoker, Senior Environmental Scientist, at (626) 335-9092 or by email at Kelly.Schmoker@wildlife.ca.gov.

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Hello Mr. Bobroff,

My name is Leon Roullard and I am writing this email in regards to the proposed bike path along the Rincon coast line. I am writing from the perspective of an avid Cyclist, Paraglider, and California native with a Marine Biology degree from UCSC. I am aware that many people enjoy this beautiful State and seek to find a solution that accommodates all those who choose to enjoy what it has to offer.

My love for the California coastline and all the amazing and beautiful activities it provides our citizens is difficult to quantify. I have been recreationally and competitively riding bicycles since the early 80's and intend to continue riding until my legs won't spin the gears. I have ridden large stretches of the California coast and I am well aware of the importance of safe bike paths, especially in the Rincon stretch. A bike path is essential through this section and will be a great boon to the community.

I have been an aviator for over 24 years and paragliding pilot for the past 5 years. The coastal soaring site known as Bates is a particularly special site for it's rare good conditions for all Paraglider pilots, and especially for me and my fiance.

My fiance Lena and I met paragliding in Santa Barbara in late 2017. She, a veteran of 10+ years in the sport and me, a fledgling pilot of a couple years at the time. We hit it off immediately and have traveled the world flying paragliders ever since. In 2019 on a flying trip to Santa Barbara we decided to check the conditions at Bates. In light conditions I launched and soared down to the beach. After hiking back up the ridge Lena met me at the edge of the launch. I dropped to my knee and asked the love of my life to spend the remainder of our lives together. She said yes. We both then launched into some of the best conditions I have ever experienced at Bates and flew till sunset on what is now one of the most special flying sites for us, in the entire world.

I am fully aware that all things in this life are passing and we gain little by clinging to them. However, it would be a shame to see this amazing and rare coastal soaring site destroyed when alternative solutions that accomodate all interested parties exist.

Thank you for taking the time to read this email and consider alternative solutions.

Blue Skies,

Leon Roullard

Subject: Rincon Bike trail and the effect on the Bates flying site

****EXTERNAL EMAIL****
CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Dear Nick,

As a longtime Santa Barbara resident, and hang glider pilot, I urge you and the Carpinteria city council to please consider inclusion to the EIR any impact that any grade changes will have on the airflow over the ridge at the bates road launch site. This site is a local treasure, and one of the few places remaining on the coast for hang gliding and paragliding.

The shape of the hillside, has a direct impact on our ability to fly there, and we are very concerned to hear of the possible changes being proposed.

While I love the idea of a bike path, I truly hope that consideration can be made to facilitate flying there as well. And I'm sure that there are ways to accommodate both without adversely affecting the other.

Thanks for your time and consideration.

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Hello Nick,

My name is Logan and I grew up here in Carpinteria. For the last 29 years I have enjoyed the dirt playground and view from atop the Thunder Bowl. I am a Paraglider pilot, surfer and cyclist.

As a Paraglider pilot I am very concerned about the upcoming project and how it will destroy our flying at Bates. This site is the reason I first started flying and now it has become my lively hood. Both paragliding that lead me to flying airplanes and helicopters. The freedom of soaring at Bates is unbeatable and taking it will be a huge hit to the free flying community.

As a surfer and beach goer the current plan will not increase beach access. And will change the parking area into a more jumbled and dangerous parking area. I don't think that is the goal.

As a cyclist that has gone up and down the coast this section requires a quick trip on the shoulder of the on ramp/off ramp or going down Bates. Both have been easy options and with the new plan of dumping cyclist into the parking lot I am 100% positive the cyclist will opt to go around. This path is not for cyclist. And will hardly be used by pedestrians. Putting the path on the freeway side is of zero detriment to the plan and offers to keep the original beautify and usefulness as a multi recreational use area.

Please do the right thing, and consider different options.

Logan Walters

Hi Nick, just want to add my voice to the din to let you know I have real concerns about the bike path project and how it's coming together.

I feel there's a lot at stake here and hope that you will hear out all sides, follow the necessary guidance and do everything you can to ensure a fair and reasonable outcome.

Best,

M.

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Dear Nick, and those preparing the EIR,

I am expressing my concern that the displacement of existing dirt and rock, and consequent slope change, will irreparably harm the Rincon site. Local osprey and turkey vultures frequent this site. Will their flight patterns be impacted? Are there migratory birds that will be impacted? Are there other species that live in or near the slopes and rely on the updrafts?

Also, the recreational activities paragliding and hang gliding, which have utilized this site for more than 35 years, will be forever impacted by a slope change. I believe this warrants serious consideration. A plan that leaves the existing slope intact and routes the bike path differently would be greatly preferred.

Thank you for your consideration.

Mike Harrington

Re: 2020100582, Carpinteria Rincon Trail Project, Santa Barbara County

Dear Mr. Bobroff:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

RECEIVED
NOV 09 2020
CITY OF CARPINTERIA

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Nancy.Gonzalez-Lopez@nahc.ca.gov.

Sincerely,

Nancy Gonzalez-Lopez
Cultural Resources Analyst

Re: Rincon Multi-Use-Trail (M.U.T.) Notice of Preparation (NOP), Environmental Impact Report (EIR)

Dear Mr. Bobroff:

I am responding to the proposed project, with a few questions (see attached addendum page 1), for the video conferencing meeting, scheduled for November 17, 2020 at 4:30pm. The removal of "Little Diamondhead," (see addendum page 2) which is primarily used by paraglider and hang glider pilots (addendum pages: 3, 3a, 3b, 3c, and 3d). The focused, EIR, should include the effect of air flow, due to the prevailing Southwest winds, into a venturi (which will still exist, if the M.U.T. as proposed, is built) , to traffic on the 101 Freeway. The resulting traffic noise (measured in decibels, on both sides of "Little Diamondhead," removes a sound barrier for Rincon Point residents, and beach goers. If Point Mugu Rock were to be removed, to alter the existing bike path, on the Pacific Coast Highway, to gain a Pacific Ocean view, would that be, a safer alternative, for bicyclists? "Little Diamondhead," is a landmark. It should not be removed. Please review the video link to "Preserving Free Flight at Bates Bluff." This video was made by Santa Barbara Soaring Association member and outstanding pilot and friend, Aaron LaPlante.

https://www.youtube.com/watch?v=SVIdEfWHMpE&feature=share

Highway lane closures, during the expected two-year build interval, will cause more traffic and accidents on the freeway. Beach closures can also be anticipated. Construction noise and pollution will aggravate and affect, drivers and beach goers and bicyclists and paragliders and hang gliders.

I have taken an informal survey, of 100 bicyclists, from July 2020 to September 2020, at the King property, launch area on different days of the week, and at varying times of day. I asked three questions: 1) "Would you mind, if I asked you a few questions, about the proposed bike path?"
2) "Are you local, or from out of town?"
3) "Considering the wind, would you prefer to have the bike path extended across the front of that bluff ("Little Diamondhead, " as I pointed, to it) , or on the Southbound 101 freeway side?"(see addendum 4).

In the city of Ventura, the primary users of Surfers Pointe had their concerns and suggestions, ignored. The surfers asked and suggested that the Ventura bike path extension, not be built on the Pacific Ocean side. Funds were designated, the bike path was built, and was claimed by the Pacific Ocean.

Respectfully,
Ottis Gillespie 11/10/2020

NOV 12 2020
CITY OF CARPINTERIA

If the "Little Diamondhead," bluff is destroyed, will the M.U.T. be aligned parallel, to the Southbound 101 freeway, as we, the paragliding and hang gliding pilots, have suggested, it be done, now, with the existing bluff? This preferred position and route can be implemented at less cost, less dirt removal, and less environmental impact. This will mean significantly fewer potential disruptions to Union Pacific Railroad operations, drivers on the 101 freeway, Rincon Point residents, and beach goers.

What is the "focus," of the "Focused Environmental Impact Report?" Will the primary users of "Little Diamondhead," have any input or be given, any consideration?

Will the E.I. R. include: current noise levels on both sides of "Little Diamondhead"? Can the measurement of decibels be conducted, hourly, for a one-week period, for 5 minutes, each hour, between the hours of 6 and 10am (commuter times,) and 2 and 6pm? This will measure what will be heard by residents of Rincon Point and beach goers, and M.U.T. users (Fifty feet, east of the wind sock and 15 feet above the freeway, and 20 feet away, from "Little Diamondhead?" Also, can high and low tide days, and wind speed measurement, in this E.I. R.?

If the "Little Diamondhead," bluff, is destroyed, will the amount of dirt and debris be pulverized on site? Will this undermine and/or destabilize the 101 freeway? The Union Pacific Railroad? The M.U. T.? The beach?

How will supports (drilled or impact driven into the dirt), affect the stability of the reconfigured land mass?

What will be the estimated and measured, emissions from equipment operating in the construction zone?

Did the "landslide sampling," include sampling on the north side of "Little Diamondhead?"

Will any or all of the approximately 90,000cu yds, of dirt left over, be stored or used on private property?

Addendum 3d

ORG

ORG

Addendum 4

Answers to informal survey of bicyclists from July 2020 to September 2020.

One hundred bicyclists were asked the three listed questions.

"Would you mind, if I asked you a few questions, about the proposed bike path?"

"Are you local, or from out of town?

"Considering the wind, would you prefer to have the bike path extended across the front of that bluff ("Little Diamondhead," as I pointed, to it, from the King property launch area), or on the Southbound 101 freeway side?"

1) One, "Yes," Ninety-nine, "No," answers
2) Thirty-one, "Local," bicyclists. Sixty-eight, "Out of town."
3) One respondent, did not respond,
4) One "Local," resident, preferred the Pacific Ocean side, of the bluff (Little Diamondhead).
5) Ninety-eight, of ninety-nine, bicyclists, responded that they would prefer the freeway side of "Little Diamondhead," as the route extension.

- What Bates means to you and why the ridge should be preserved

Ridge soaring is the sole reason I got into paragliding and my first introduction into this was at the Bates site. Seeing it from the road or at the beach changed how I saw the world and allowed me to join a sport that has brought me endless joy. I have even turned down moving out of state for my job due to the fact that I could not paraglide and paraglide at the Bates site. If this site is destroyed i would have no reason to stay in the area and would most likely sell my house and move. That is how much this site means to me and i hope the severity of it is not lost on you or the economic impacts of a small change that will affect a community of very dedicated individuals.

- Why the EIR needs to assess impacts to wind and recreation

Please review what happened in Sand City, Ca. They removed a dune next to the coast and the environmental impacts have been felt ever since not to mention a permanent scar on the land. The arrogance of cities to structurally change nature to meet their needs is something I expect to see in parts of the country like Texas not in California where we hold ourselves to a hire environmental continuous standard.

I don't believe the walking trail will be used that much but the environmental impacts will have far reaching impacts that i don't believe have been looked into. Please reconsider this action

- Why the City should consider alternatives like the North side of Bates.

It is a win win, the community gets there walking trail (which i suspect will not even be used that much) and the site/dune will be preserved.

Nick, If you don't mind in my behalf could you speak for me. The Bridge is a very sensitive site and from what I have been told there's a recorded site nearby. I would definitely recommend a Native monitor on site for any earth disturbing activity. I would like to be the one to monitor this project when it does happen.Thank you, and have a great day.
Sincerely,

Patrick Tumamait

Contact Person for the Carpinteria/Rincon Multi-Use Trail Project
Carpinteria City Hall

November 24, 2020

Dear Mr. Bobroff,

My husband, Rob, and I have lived in Carpinteria since 2007, and currently live in the Vista de Santa Barbara Mobile Home Park directly across from the Bluffs. We love our town and cherish the open spaces that we are privileged to enjoy! We fully support the idea of finishing a trail connection between Rincon Beach and the Carpinteria Coastal Trail. We love to ride our bikes on and around the Bluffs and frequently use both sections of the existing trail. Having a completed trail would be a great asset to many people.

We attended the virtual meeting held on November 17 in which the plan for the new trail section was discussed in preparation for an upcoming Environmental Impact Report, and we have a few questions, concerns, and requests.

First, we are concerned that the current plan involves the removal of so much dirt and land. Perhaps we are joining the conversation about this new trail segment too late, but have all other possible routes truly been considered and evaluated? Is the purpose of this segment to provide a practical and efficient completion of the trail, using existing corridors and structures, and being less invasive into natural habitat, or is it to provide a scenic experience for the hiker or biker?

We, personally, would be willing to sacrifice a great view as we ride along a short segment of the trail, if it meant that we could preserve a larger portion of the Bluffs undisturbed.

As I am sure you are aware, our Bluffs are a repository of many rapidly vanishing native species. If there is truly no other route option other than the one that is being presented, we request that every precaution be taken to evaluate and protect the plant and animal species that would be impacted by the location of the new trail and the digging and construction that would it would involve.

A Certificated California Botanist is needed to evaluate any plant species that would be impacted. A scientist with this certification would have specialized knowledge of plants and biomes that are specific to the Bluffs, and be able to determine if any lasting harm to a native plant species might be a result of this project. In the same manner, a biologist with specific training in the animal life of California habitats, especially coastal habitats, should be included in the upcoming EIR.

We are also concerned about the use of the Rincon Beach parking lot as a part of the new trail segment. This parking lot is extremely busy on almost every day of the year! This part of the proposal did not seem to be well thought-out, or perhaps was just not very clear. Will there be a way to separate and protect trail users from beach users and cars in the entire parking lot area extending down towards Bates Road?

We certainly recognize that there are numerous details, opinions, and desires to be taken into consideration as you move forward. We thank you in advance for using caution and care for the native species of plants and animals that live in the Bluffs as you make decisions regarding the completion of the Carpinteria/ Rincon Multi-Use Trail.

Sincerely,
Christi and Rob Hudson

Subject: Bates terrain modifications

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Nick,
Please seriously consider redirecting the bike lane to the highway side of the ridge. Sending it through the parking lot will be grossly problematic for bicyclist safety.
Also, when they move all that earth, consider directing the use of the soil to build up the paraglider launch vertically, or lengthwise, since it is a bunch of fill there anyway. The taller/longer the launch site can be made, the greater utility it has, basically forever. Hauling off 4K trucks full of soil is a waste of resources and generates CO2 which persists in the atmosphere for 100 years. Use the soil to make the launch site better, I'd say.
Thanks!
Rich Graham

Additional notes below:

1. Paragliding and Hang Gliding are official sports that have been fully established at Bates for over 40 years. Bates uniquely combines Southwest facing terrain with prevailing channel winds, allowing airflow to hit the ridge like the swells hit Rincon Point. It is the only coastal soaring site in Carpinteria and the best location for consistent soaring conditions between San Diego and San Francisco. This recreational airpark is cherished by residents, tourists, and pilots alike. It deserves preservation with the City.

2. Bates is a coastal gem that allows small groups like ours to use the same natural resources for recreation as the local bikers, surfers, beachgoers, and joggers. The current design runs counter to this sentiment: the bike path expands access to one group at the exclusion of another. While bikers and joggers have many miles of recreational paths to access, the construction of this 0.2 mile section will drastically impact wind flow, ending free flight for many members of the soaring community and ruining the only soaring site in Carpinteria.

3. The scope of the EIR should address ways to avoid massive earthwork at this site. The Certified Santa Barbara County Coastal Land Use Plan adopted in 1982 states "recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment...shall have priority over uses requiring substantial alteration". According to this guidance, free flight at Bates should have priority over this massive earthwork Project because our recreational uses do not require alteration to the existing natural environment.

4. The current design is focused on providing a “blue ocean view” rather than a safe, useful, long-lasting solution. There is no plan for maintaining this bike path after it's constructed on a 100 year old eroding seawall, where a railroad and highway have already failed. There is also no plan for managing traffic in the already congested and incredibly steep Rincon Beach parking lot where the bike path terminates. This Project needs to be reassessed from the perspective of the very groups it's trying to help.

5. We request project alternatives that preserve the ridge at Bates. A possible option is constructing the Bike Path on the Northside of the ridge, either along the highway or on the North side of the highway. The use of barriers along the highway shoulder, for

example, would be consistent with the bike path design that exists from Rincon to Ventura, and would be more cost effective while preserving the natural environment.

Dear sir I am weighting in support of the local flying community to save the bates cliff flying site I have flown from that spot since 1975 when I began flying at age fifteen. I have seen many sites be taken from the flying community over the years. Please don't let happen to this one. If you look at what Torrey Pines has done for the cities of Del Mar and La Jolla. It draws pilots from all over the world and bates has the potential to do the same. Thank you for your consideration, Randall Liggett 707-391-4516

Hi,

I'm confident that if CalTrans will work with the free flight community we can have both a bike path and a hill that will still provide the airflow we need to continue flying at Bates.

But the proposed design as it stands right now will completely ruin the lift at Bates. So I'm begging you, let's take the time to make this work for pilots and cyclists alike.

Thanks,

Steve Crye

Hi Nick,

I am writing to quickly say how much I love Bates and I don't agree with the proposed project for the Rincon Bike Path. Please accept this email as my formal objection as it will displace 156,000 tons of soil effectively ruining the flight ridge. What studies have been conducted to estimate the negative effects this will have?

Why don't you build stairs instead so folks can enjoy the sand and walk on the beach? Or please consider the north side of Bates for the flight path.

Kind regards,
Shanon

Hello,
My name is Sarah Saturday and I am a paragliding pilot that learned how to fly in Santa Barbara. Bates was my first ever coastal flight and it was extremely memorable and an invaluable learning opportunity. I have since returned and flown the site multiple times. Santa Barbara is a paragliding Mecca that brings pilots from all over the world, contributing to the tourism economy and expanding opportunities for coastal recreation. Building a bike path that will drastically reshape the bluff will create a dangerous or non-flyable zone for all pilots who wish to fly here. I am emailing to express my concern that a bike path will drastically reduce the visitors to this area and harm the paragliding community. Thank you for taking the time to read this message.

Regards,
Sarah Saturday

Good Day Nick,

I grew up in Carp and regularly come home to enjoy family, friends, beach, and a little paragliding.

A bike path to Rincon is a fine idea and I fully support this. Certainly, I remember the days when Rincon was little known to non-locals and only accessible by car. Riding to the beach from town by bike seems something I would do with my family, and this may attract both locals and tourists to a great spot on the California Coast. BUT, I do hope the impact to the Bates ridge soaring for Paragliders will be considered. With a little careful planning, by either dropping the path toward the water before the launch area or keeping at the top of the bluff till past the launch may allow both bicyclists and Paragliders to enjoy that great spot together.

Please engage with the local pilots to work on a plan to meet both uses.

Thanks,
Scott Schoenfeld

Dear Mr. Bobroff,

I hope that this email finds you well despite the circumstances. This is Sangwon Suh, living in Goleta. I am sending you this email to share my humble opinion on the new proposal to construct a bike path around the Bates / Rincon bluff area.

As an environmental scientist and a nature lover, I applaud the effort to make the site more accessible to the public. Over the past years, I learned to appreciate the beauty of the view from Bates / Rincon bluff, while I thought that the remnants of the cement concrete blocks on the slope were an eyesore.

I happened to be a paragliding pilot and I am sure that you are aware of the concerns raised by some of my fellow paragliding pilots. There certainly is a wide-spread concern among paragliders, as the proposed plan may permanently damage the soarability of the site.

In my view, however, no development project can satisfy every single stakeholders and I trust that whatever the authority decides for the benefits of the public, it will be an improvement. I am writing this to you not as an attempt to sway the decision from one to another but to support and appreciate the transparent and open dialogue amongst all stakeholders.

I believe that the committee will make the decision taking all the voices into their consideration. Thank you for your willingness to listen to us.

Best, Sangwon

Re: Santa Barbara County Air Pollution Control District Response to Notice of Preparation of a Draft Environmental Impact Report for Rincon Trail Project, 19-2015-CUP/CDP

Dear Nick Bobroff:

The Santa Barbara County Air Pollution Control District (District) appreciates the opportunity to provide comments on the Notice of Preparation (NOP) of a Draft Environmental Impact Report (EIR) for the Rincon Trail Project. The applicant proposes to construct and operate a multi-use trail approximately 2,800 feet long and 16 feet wide with a 160 feet long bridge over the railroad tracks. Grading is estimated at 104,000 cubic yards (CY) of cut, 10,300 CY of fill, and 94,100 CY of export. It is anticipated that construction of the proposed project would commence in March 2022 and reach completion by March 2024, for a total construction window of approximately two years. The project site is located at the end of Carpinteria Avenue in the City of Carpinteria and Rincon Beach County Park in the County of Santa Barbara.

District staff reviewed the NOP of a Draft EIR and concurs that air quality impacts should be addressed in the EIR. The District's guidance document, entitled *Scope and Content of Air Quality Sections in Environmental Documents* (updated June 2017), is available online at www.ourair.org/land-use. This document should be referenced for general guidance in assessing air quality impacts in the Draft EIR.

The EIR should evaluate the following potential impacts related to the Rincon Trail Project:

1. **Construction Impacts.** The proposed project will involve air quality impacts associated with heavy equipment use for earth-moving activities and bridge construction, as well as truck trips associated with the export of soils, equipment and materials delivery, and employee commute. Common earthwork equipment, such as dozer, excavator, dump truck, roller, skid steer, and tractor, will be used for trail construction, v-trench construction, and installation of fencing. Two cranes will be required for the installation of the prefabricated bridge. The bridge foundation will be constructed using deep piles. The EIR should include a description and quantification of potential air quality impacts, including criteria pollutant emissions and greenhouse gas emissions, associated with construction activities for the proposed project. The District's June, 2017 *Scope and Content* document, Section 6, presents recommended mitigation measures for fugitive dust and equipment exhaust emissions associated with construction projects. Construction mitigation measures should be enforced as conditions of approval for the project. The Draft EIR should

include a Mitigation Monitoring and Reporting Plan that explicitly states the required mitigation and establishes a mechanism for enforcement.

In addition, please be advised that the project will be subject to the following **regulatory requirements**:

1. All portable diesel-fired construction engines rated at 50 bhp or greater must have either statewide Portable Equipment Registration Program (PERP) certificates or District permits prior to grading/building permit issuance. **Construction engines with PERP certificates are exempt from the District permit, provided they will be on-site for less than 12 months.** If a District permit is required, proof of receipt of the District permits shall be submitted by the applicant to planning staff. *The District permit process can take several months*. *To avoid delay, the applicant is encouraged to submit their Authority to Construct permit application to the District as soon as possible, see www.ourair.org/permit-applications to download the necessary permit application(s).*

2. Two engine cranes are subject to CARB's In-Use Off-Road Diesel-Fueled Fleets Regulation. For more information on applicable requirements of the Off-Road Regulation, please visit the following website: www.arb.ca.gov/msprog/ordiesel/ordiesel.htm. In addition, the upper engine on a crane must have either a statewide Portable Equipment Registration Program (PERP) certificates or District permits prior to grading/building permit issuance. Two engine cranes are eligible for registration in PERP provided they will be on-site for less than 12 months.

3. The application of architectural coatings, such as paints, primers, and sealers that are applied to buildings or stationary structures, shall comply with District Rule 323.1, *Architectural Coatings* that places limits on the VOC-content of coating products.

4. Asphalt paving activities shall comply with District Rule 329, *Cutback and Emulsified Asphalt Paving Materials*.

5. Construction/demolition activities are subject to District Rule 345, *Control of Fugitive Dust from Construction and Demolition Activities*. This rule establishes limits on the generation of visible fugitive dust emissions at demolition and construction sites, includes measures for minimizing fugitive dust from on-site activities, and from trucks moving on- and off-site. Please see www.ourair.org/wp-content/uploads/rule345.pdf. Activities subject to Rule 345 are also subject to Rule 302 (*Visible Emissions*) and Rule 303 (*Nuisance*).

6. If the project area to be disturbed: a) is located in a geographic ultramafic rock unit; b) has naturally-occurring asbestos, serpentine, or ultramafic rock as determined by the owner/operator; or c) is discovered by the owner/operator, a registered geologist, or the Air Pollution Control Officer to have naturally-occurring asbestos, serpentine, or ultramafic rock after the start of any construction or grading; then appropriate abatement measures must be undertaken pursuant to the requirements of the Air Resources Board Air Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations (see www.arb.ca.gov/toxics/asbestos/asbestos.htm).

7. At all times, idling of heavy-duty diesel trucks should be minimized; auxiliary power units should be used whenever possible. State law requires that:
   - Drivers of diesel-fueled commercial vehicles shall not idle the vehicle's primary diesel engine for greater than 5 minutes at any location.
   - Drivers of diesel-fueled commercial vehicles shall not idle a diesel-fueled auxiliary power system (APS) for more than 5 minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle. Trucks with 2007 or newer model year engines must meet additional requirements (verified clean APS label required).
   - See www.arb.ca.gov/noidle for more information.

In addition, the District recommends that the following **best practices** be applied to the project as appropriate:

1. To reduce the potential for violations of District Rule 345 *(Control of Fugitive Dust from Construction and Demolition Activities)*, Rule 302 *(Visible Emissions)*, and Rule 303 *(Nuisance)*, standard dust mitigations (**Attachment A**) are recommended for all construction and/or grading activities. The name and telephone number of an on-site contact person must be provided to the District prior to grading/building permit issuance.

2. The State of California considers particulate matter emitted by diesel engines carcinogenic. Therefore, during project grading, construction, and hauling, construction contracts must specify that contractors shall adhere to the requirements listed in **Attachment B** to reduce emissions of particulate matter (as well as of ozone precursors) from diesel equipment. Recommended measures shall be implemented to the maximum extent feasible. Prior to grading/building permit issuance and/or map recordation, all requirements shall be shown as conditions of approval on grading/building plans, and/or on a separate sheet to be recorded with the map. Conditions shall be adhered to throughout all grading and construction periods. The contractor shall retain the Certificate of Compliance for CARB's In-Use Regulation for Off-Road Diesel Vehicles onsite and have it available for inspection.

We hope you find our comments useful. We look forward to reviewing the Draft EIR. Please contact me at 961-8873 or by e-mail at HoD@sbcapcd.org if you have questions.

Sincerely,

Desmond Ho

Attachments: Fugitive Dust Control Measures
Diesel Particulate and NO_x Emission Measures

cc: Planning Chron File

air pollution control district
SANTA BARBARA COUNTY

ATTACHMENT A
FUGITIVE DUST CONTROL MEASURES

These measures are required for all projects involving earthmoving activities regardless of the project size or duration. Projects are expected to manage fugitive dust emissions such that emissions do not exceed APCD's visible emissions limit (APCD Rule 302), create a public nuisance (APCD Rule 303), and are in compliance with the APCD's requirements and standards for visible dust (APCD Rule 345).

- During construction, use water trucks or sprinkler systems to keep all areas of vehicle movement damp enough to prevent dust from leaving the site and from exceeding the APCD's limit of 20% opacity for greater than 3 minutes in any 60 minute period. At a minimum, this should include wetting down such areas in the late morning and after work is completed for the day. Increased watering frequency should be required when sustained wind speed exceeds 15 mph. Reclaimed water should be used whenever possible. However, reclaimed water should not be used in or around crops for human consumption.
- Onsite vehicle speeds shall be no greater than 15 miles per hour when traveling on unpaved surfaces.
- Install and operate a track-out prevention device where vehicles enter and exit unpaved roads onto paved streets. The track-out prevention device can include any device or combination of devices that are effective at preventing track out of dirt such as gravel pads, pipe-grid track-out control devices, rumble strips, or wheel-washing systems.
- If importation, exportation, and stockpiling of fill material is involved, soil stockpiled for more than one day shall be covered, kept moist, or treated with soil binders to prevent dust generation. Trucks transporting fill material to and from the site shall be tarped from the point of origin.
- Minimize the amount of disturbed area. After clearing, grading, earthmoving, or excavation is completed, treat the disturbed area by watering, OR using roll-compaction, OR revegetating, OR by spreading soil binders until the area is paved or otherwise developed so that dust generation will not occur. All roadways, driveways, sidewalks etc. to be paved should be completed as soon as possible.
- Schedule clearing, grading, earthmoving, and excavation activities during periods of low wind speed to the extent feasible. During periods of high winds (>25 mph) clearing, grading, earthmoving, and excavation operations shall be minimized to prevent fugitive dust created by onsite operations from becoming a nuisance or hazard.
- The contractor or builder shall designate a person or persons to monitor and document the dust control program requirements to ensure any fugitive dust emissions do not result in a nuisance and to enhance the implementation of the mitigation measures as necessary to prevent transport of dust offsite. Their duties shall include holiday and weekend periods when work may not be in progress. The name and telephone number of such persons shall be provided to the Air Pollution Control District prior to grading/building permit issuance and/or map clearance.

PLAN REQUIREMENTS: All requirements shall be shown on grading and building plans and/or as a separate information sheet listing the conditions of approval to be recorded with the map. **Timing**: Requirements shall be shown on plans prior to grading/building permit issuance and/or recorded with the map during map recordation. Conditions shall be adhered to throughout all grading and construction periods.

MONITORING: The Lead Agency shall ensure measures are on project plans and/or recorded with maps. The Lead Agency staff shall ensure compliance onsite. APCD inspectors will respond to nuisance complaints.

air pollution control district
SANTA BARBARA COUNTY

ATTACHMENT B
DIESEL PARTICULATE AND NO_x EMISSION REDUCTION MEASURES

Particulate emissions from diesel exhaust are classified as carcinogenic by the state of California. The following is a list of regulatory requirements and control strategies that should be implemented to the maximum extent feasible.

The following measures are required by state law:

- All portable diesel-powered construction equipment greater than 50 brake horsepower (bhp) shall be registered with the state's portable equipment registration program OR shall obtain an APCD permit.
- Fleet owners of diesel-powered mobile construction equipment greater than 25 hp are subject to the California Air Resource Board (CARB) In-Use Off-Road Diesel-Fueled Fleets Regulation (Title 13, California Code of Regulations (CCR), §2449), the purpose of which is to reduce oxides of nitrogen (NOx), diesel particulate matter (DPM), and other criteria pollutant emissions from in-use off-road diesel-fueled vehicles. Off-road heavy-duty trucks shall comply with the State Off-Road Regulation. For more information, see www.arb.ca.gov/msprog/ordiesel/ordiesel.htm.
- Fleet owners of diesel-fueled heavy-duty trucks and buses are subject to CARB's On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation (Title 13, CCR, §2025), the purpose of which is to reduce DPM, NOx and other criteria pollutants from in-use (on-road) diesel-fueled vehicles. For more information, see www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm.
- All commercial off-road and on-road diesel vehicles are subject, respectively, to Title 13, CCR, §2449(d)(3) and §2485, limiting engine idling time. Off-road vehicles subject to the State Off-Road Regulation are limited to idling no more than five minutes. Idling of heavy-duty diesel trucks during loading and unloading shall be limited to five minutes, unless the truck engine meets the optional low-NOx idling emission standard, the truck is labeled with a clean-idle sticker, and it is not operating within 100 feet of a restricted area.

The following measures are recommended:

- Diesel equipment meeting the CARB Tier 3 or higher emission standards for off-road heavy-duty diesel engines should be used to the maximum extent feasible.
- On-road heavy-duty equipment with model year 2010 engines or newer should be used to the maximum extent feasible.
- Diesel powered equipment should be replaced by electric equipment whenever feasible. Electric auxiliary power units should be used to the maximum extent feasible.
- Equipment/vehicles using alternative fuels, such as compressed natural gas (CNG), liquefied natural gas (LNG), propane or biodiesel, should be used on-site where feasible.
- Catalytic converters shall be installed on gasoline-powered equipment, if feasible.
- All construction equipment shall be maintained in tune per the manufacturer's specifications.
- The engine size of construction equipment shall be the minimum practical size.
- The number of construction equipment operating simultaneously shall be minimized through efficient management practices to ensure that the smallest practical number is operating at any one time.
- Construction worker trips should be minimized by requiring carpooling and by providing for lunch onsite.
- Construction truck trips should be scheduled during non-peak hours to reduce peak hour emissions whenever feasible.
- Proposed truck routes should minimize to the extent feasible impacts to residential communities and sensitive receptors.
- Construction staging areas should be located away from sensitive receptors such that exhaust and other construction emissions do not enter the fresh air intakes to buildings, air conditioners, and windows.

PLAN REQUIREMENTS AND TIMING: Prior to grading/building permit issuance and/or map recordation, all requirements shall be shown as conditions of approval on grading/building plans, and/or on a separate sheet to be recorded with the map. Conditions shall be adhered to throughout all grading and construction periods. The contractor shall retain the Certificate of Compliance for CARB's In-Use Regulation for Off-Road Diesel Vehicles onsite and have it available for inspection.

MONITORING: The Lead Agency shall ensure measures are on project plans and/or recorded with maps. The Lead Agency staff shall ensure compliance onsite. APCD inspectors will respond to nuisance complaints.

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Dear Mr. Bobroff:

I write to voice sincere opposition to the proposed development that would change the topography of the Bates bluff.

The Bates free flight site is unique on the California Coast, and historically important for development of hang gliding and paragliding techniques that have improved performance, safety, and enjoyment for thousands locally and around the world.

I live in Utah, yet enjoy visiting Ventura annually to fly Bates.

Altering the slope will impair severely the wind currents and patterns such that not only will Bates be less flyable, if flyable at all, but since launching and ascending at Bates is necessary to access the ridges to the East, access to the ridge will be lost also.

I support property rights and also public access to the Coast.

I urge you to seek and implement a solution that enables the proposed access and use, but without altering Bates such that free flight use and enjoyment is lost forever.

Thank you for your consideration of this point of view.

Sincerely,

Todd Crowley, J.D.

Good Afternoon,

As a part time resident of Carpinteria, I would like to chime in on the current proposal for the bike path extension. I am all for connecting the paths togethers through the Bates/Rincon area, However, as a paraglider pilot who has be flying at Bates for almost 30 years, I wish and hope that you consider what an incredible resource that having a ridge soaring site in Carpinteria is.
I know that paragliding is a relatively small fringe sport but its the small things that add to the greater whole which make Carpinteria so special. I'm not sure if there is a work around but once its gone it will be gone for good!

Thanks for your hard work on the project!

Sincerely, Thomas Livingstone

thanks Nick!
My only comment would be to request that the EIR try to address the hang gliders concerns with cutting back the hillsides.

VENTURA COUNTY
AIR POLLUTION CONTROL DISTRICT
Memorandum

TO: Nick Bobroff, Principal Planner

DATE: November 24, 2020

FROM: Nicole Collazo, Air Quality Specialist

SUBJECT: Comment Letter on Notice of Preparation of EIR for the Carpinteria Rincon Multi-Use Trail Project

Air Pollution Control District (APCD) staff has reviewed the subject Notice of Preparation (NOP) of a draft environmental impact report (EIR), which will identify any potential environmental impacts, for the construction and operation of the project mentioned above. The Lead Agency for the project is the City of Carpinteria.

GENERAL COMMENTS

The project lies within the jurisdiction of Santa Barbara County and the Santa Barbara County Air Pollution Control District (SBCAPCD). However, due to the construction operations occurring immediately adjacent to a residential community within Ventura County, it is suggested that emission reduction measures and fugitive dust control measures are recommended for construction operations occurring on the eastern end of the construction site to avoid dust-driven or odor-driven violations from complaints within Ventura County.

A reference document such as the Ventura County Air Quality Assessment Guidelines (AQAG), or SBCAPCD's guidelines for emission reduction measures for construction emissions are encouraged. We note that the AQAG has not been updated since 2003, serves as a guidance document, and greater reduction measures can be recommended for construction mitigation, including using newer, cleaner diesel Tier 3 or Tier 4 off-road engines and/or using on-road construction vehicles of year 2010 model or greater. These reduction measures can serve as a standard condition of approval for discretionary permit with Lead Agency in the case there are many sensitive receptors in the vicinity and/or if construction is expected to occur over several months. The diesel particulate matter (DPM) emissions from diesel-powered construction and grading equipment is a considered a toxic

air contaminant by the EPA and accounts for 70-80% of the overall cancer risk from mobile source emissions (CARB 2005 Land Use Handbook, MATES IV Study, respectively).

Thank you for the opportunity to comment on the project NOP. If you have any questions, you may reach me at nicole@vcapcd.org.

Sent via email: Anthony.Ciuffetelli@ventura.org

Subject: **Request for Comment on Carpinteria Rincon Multi-Use Trail Project RMA Reference #19-012-1**

Dear Mr. Ciuffetelli,

Ventura County Cultural Heritage Board (CHB) Staff are in receipt of the Notice of Preparation (NOP) of an Environmental Impact Report (EIR) for the above-referenced projects. Thank you for the opportunity to review and comment on the proposed telecommunications tower. We have researched the subject site, as well as property within the vicinity, and found the following:

- No listed or known historic resources eligible for listing are located on or near the subject site;
- Areas in the vicinity of the subject site do exhibit a low potential to contain paleontological resources;
- Areas in the vicinity of the subject site exhibits a high likelihood of containing archaeological resources (very sensitive).

A previous survey of the northern half of Ventura County indicated that "year-round settlements of Native Americans are located in areas of moderate winter climate, perennial water, and major plant communities for sustenance. […] Areas rich in natural resources, especially foods and implement materials, were sites of seasonal camp and food preparation sites."[1] We understand the subject area for the proposed project is located in the vicinity of natural waterways, including the Pacific Ocean and Rincon Creek. Due to the aforementioned historical practices, combined with the project site's proximity to these features, these activities could result in the subject area having a high sensitivity for tribal cultural resources. Therefore, it is recommended that outreach be conducted with relevant Native American tribes pursuant to federal and State law.

[1] James, Susanne M., *The North Half of Ventura County: Scenic, Biological and Cultural Resources*, April 1986.

Due to the potential paleontological and archaeological sensitivity of the subject site, implementation of the project could encounter previously undiscovered or unrecorded paleontological and archaeological sites, materials, and resources. Ground-disturbing activities have the potential to damage or destroy previously undiscovered or unrecorded paleontological and archaeological resources. Therefore, the following measures are recommended to reduce impacts to paleontological resources to the greatest extent feasible:

- The Applicant should retain a paleontological consultant or professional geologist to monitor all subsurface grading, trenching, or construction activities on the subject site;
- If any paleontological remains are uncovered during ground disturbance or construction activities, the Applicant should:
    a. Cease operations and ensure the preservation of the area in which the discovery was made;
    b. Notify the Lead Agency immediately;
    c. Obtain the services of a qualified paleontological consultant or professional geologist to assess the find and provide a report that assesses the resources and sets forth recommendations on the proper disposition of the site;
    d. Provide the paleontological report to the Lead Agency;
    e. Obtain the Lead Agency's written concurrence with the recommended disposition of the site before resuming development; and
    f. Implement the agreed upon recommendations.

Additionally, based on the subject site's high degree of sensitivity related to archeological resources, the following measures are recommended to reduce impacts to archaeological resources to the greatest extent feasible. Moreover, it is recommended that outreach be conducted with relevant Native American tribes to determine if known tribal cultural resources are present in the subject site area.

- The Applicant should retain a Native American monitor to monitor all subsurface grading, trenching, or construction activities on the subject site;
- If any archaeological or historical artifacts are uncovered during ground disturbance or construction activities, the Applicant should:
    a. Cease operations and ensure the preservation of the area in which the discovery was made;
    b. Notify the Lead Agency immediately;
    c. Obtain the services of a qualified archaeologist who shall assess the find and provide recommendations on the proper disposition of the site in a written report format;
    d. Provide the report to the Lead Agency;

e. Obtain the Lead Agency's written concurrence with the recommended disposition of the site before resuming development; and
f. Implement the agreed upon recommendations.

- Consistent with Section 7050.5 of the California Health and Safety Code, if any human burial remains are encountered during ground disturbance or construction activities, the Applicant should:
    a. Cease operations and ensure the preservation of the area in which the discovery was made;
    b. Immediately notify the County Coroner and the Lead Agency;
    c. Obtain the services of a qualified archaeologist and, if necessary, Native American Monitor(s), who shall assess the find and provide recommendations on the proper disposition of the site in a written report format;
    d. Provide the report to the Lead Agency;
    e. Obtain the Lead Agency's written concurrence with the recommended disposition of the site before resuming development; and
    f. Implement the agreed upon recommendations.

Thank you again for the opportunity to comment on the proposed project. If you require anything further or have questions regarding our findings, please do not hesitate to contact Dillan Murray at (805) 654-5042 or at Dillan.Murray@ventura.org.

Sincerely,

Dillan Murray

Carpinteria Rincon Trail, Environmental Document Review – Notice of EIR Preparation, (RMA REF # 19-012-1)

Ventura County Environmental Health Division (Division) staff reviewed the information submitted for the subject project.

Proposed Carpinteria Rincon Multi-Use Trail (Project) includes the construction of:

- A shared use trail;
- A clear-span bridge;
- A stormwater drainage collection system with new drain outlets to the ocean up to the western end of Rincon Beach County Park and the Ventura County Line in Santa Barbara County.

The Division provides the following comments:

1. Project includes the construction and use of three new stormwater drainage outlets south of the Union Pacific Railroad alignment and adjacent to the Rincon Creek outlet, which is a sampling point for the Division's Ocean Water Quality Monitoring Program (OWQMP). The additional drainage outlets near the Division's OWQMP sampling point at Rincon Creek outlet may result in potentially significant impacts, both during and after construction, due to exceedances of bacteriological standards.

2. The construction and use of the stormwater drainage outlets have the potential for proliferation of vectors of disease, including mosquitoes. Stormwater structures should be designed and maintained to prevent the harborage and breeding of vectors such as mosquitoes, as well as to minimize the potential health impacts created by these vectors. The Division's Vector Control and Mosquito Abatement Program staff respond to any complaints related to these potential vectors on the Ventura County side of Rincon Point.

DATE: November 13, 2020

TO: Anthony Ciuffetelli RMA Case Planner
County of Ventura

FROM: Alex Hill, Engineer II – Advanced Planning Section

SUBJECT: RMA19-012 Carpinteria Rincon Trail
Zone 4
Watershed Protection Project Number: WC2019-0081

Pursuant to your request dated October 30, 2020, this office has reviewed the submitted materials and provides the following comments.

PROJECT LOCATION:

The proposed Carpinteria Rincon Trail would extend from the eastern end of Carpinteria Avenue in the City of Carpinteria to the western end of Rincon Beach County Park and the Ventura County Line in Santa Barbara County.

PROJECT DESCRIPTION:

Watershed Protection previously provided a “No Comment” response on 11/6/2019 and the following comments provide context for that rationale. The proposed Carpinteria Rincon Trail would extend from the eastern end of Carpinteria Avenue, in the City of Carpinteria, to Rincon Beach County Park, in Santa Barbara County. The proposed shared-use trail would be 16-feet wide (10- foot wide path with 3-foot wide paved shoulder along both sides) and approximately 2,800-feet long and would include a clear-span bridge over the UPRR alignment. The bridge would be approximately 160-feet-long, with a width of between 14-feet and 16- feet (clear width, measured inside the bridge rails). Earthwork for the trail construction would involve 104,000 cubic yards of cut, 10,300 cubic yards of which would be used for fill on-site and 94,100 cubic yards would be exported off-site. A storm drainage collection system is proposed, with new drain outlets to the ocean. The new, shared-use trail would provide a strategic addition to Carpinteria's Coastal Vista Trail that upon completion, would connect Padaro Lane to the west and Rincon Beach County Park to the east. In addition to providing critical improvements in public safety, the completion of this trail segment would provide improved public coastal access and recreational opportunities, and enhancement of non-vehicular travel alternatives to the region’s significant coastal resources.

WATERSHED PROTECTION DISTRICT COMMENTS:

The following comments are intended to provide context for the application review process, and they require no further action.

Flood Control Facilities / Watercourses – Ventura County Watershed Protection District

1. The project is located to the West of Highway 101 within Santa Barbara and Ventura Counties. There are no proposed direct connections to any Ventura County Watershed Protection District Jurisdictional redline channel. Project drainage will be conveyed to three (3) existing and three (3) proposed storm drains that will discharge into the Pacific Ocean, therefore there is no impact to WP facilities.

Hydraulic Hazards – FEMA

2. The project site is in a location identified by the Federal Emergency Management Agency (FEMA) as an area of minimal flood hazard Zone X unshaded. This is evidenced on FEMA Map Panel 06083C1438H effective September 28, 2018. The proposed development is therefore, deemed to be Less than Significant for Hydraulic Hazards - FEMA.

If you have any questions, please feel free to contact me by email at Alexander.Hill@ventura.org or by phone at (805) 654-3795.

Hi Nick,

I hope you have been doing well. I know you are really busy but I received your email about the NOP for the Rincon Trail and had a chance to review and I was hoping to talk to you real quick about the project. Are you possibly free sometime over the next few days to talk about this real quick?

I have an item on the Commission agenda for tomorrow, but it will likely go consent. I'm generally free Thursday and Friday so if there is a time that works best for you let me know.

Thanks,
Wes

Hello Nick,

Thank you for providing the opportunity to comment on the Notice of Preparation (NOP) for an Environmental Impact Report (EIR) for the Rincon Multi-Use Trail project. Commission staff had the opportunity to review this NOP and the project here is the same project reviewed and commented on by Commission staff back in December 2019. Commission staff's concerns regarding grading and landform alteration, environmentally sensitive habitat area (ESHA), public access, and water quality are still relevant and as such our December 2019 comment letter is attached to this email for consideration for this NOP.

Commission staff would appreciate the opportunity to meet with City staff and further discuss our concerns what possible revisions can be made to the project to minimize impacts to coastal resources.

A hard copy of this email correspondence and attached letter will be sent by mail and should be arriving shortly.

Please let us know if you have any questions,

Subject: Notice of Preparation (NOP) for Carpinteria Rincon Multi-Use Trail Environmental Impact Report (EIR)

The City of Carpinteria has released a Notice of Preparation (NOP) for an Environmental Impact Report (EIR) for the Rincon Multi-Use Trail project.

The City is soliciting comments from the public concerning the contents and analysis to be considered in the EIR for the proposed project. The scoping comment period will run from October 30, 2020 to November 30, 2020 at 5:00 p.m. A virtual public scoping meeting will be held online on Tuesday, November 17th at 4:30 p.m. via Zoom Webinar. Information on how to attend the virtual scoping meeting is included in the NOP.

The Notice of Preparation and detailed project description are available on the City's Rincon Trail project webpage at:
https://carpinteria.ca.us/public-works/engineering-division/rincon-multi-use-trail/
A copy of the NOP and project description is also attached to this email.

Should you have any questions about the proposed project or this NOP, please feel free to contact me.

RE: Draft Subsequent Mitigated Negative Declaration for the Carpinteria Rincon Trail (Conditional Use Permit/Coastal Development Permit 19-2015-CUP/CDP)

Dear Mr. Bobroff:

Commission staff has reviewed the Draft Subsequent Mitigated Negative Declaration (SMND) regarding the proposed realignment and redesign of the Carpinteria Rincon Trail located within the City of Carpinteria and Santa Barbara County, and we appreciate the opportunity to provide comments for your consideration. The subject SMND modifies the previously circulated Mitigated Negative Declaration (MND) for the Rincon Trail, which was subsequently approved by the City through CDP No. 15-1760, and included a 12 foot wide and 4,000 foot long shared-use trail, a 110 foot long clear-span bridge over the Union Pacific Rail Road (UPRR) alignment, 17 public parking spaces and a rest area with three picnic tables, signage, lighting and a storm drainage collection system including an on-site bioswale and a 5,000 gallon cistern to provide water for native landscaping during dry months. The original project also included 30,000 cubic yards of cut, 7,000 cubic yards of fill and 23,000 cubic yards of export. As described within the SMND, the previously approved project is proposed to be modified to include a 16 foot wide and approximately 2,800 foot long shared-use trail, a 160 foot long clear-span bridge over the UPRR alignment, and a storm drainage collection system including new drain outlets to the ocean. The project, as proposed to be amended, would also include 104,000 cubic yards of cut, 10,300 cubic yards of fill and 94,100 cubic yards of export.

The SMND states that the proposed realignment is necessary to avoid areas with historic landslides, to eliminate the need for retaining walls, to shorten the path length, and to ensure accessibility of the trail for persons with disabilities pursuant to Americans with Disabilities Act (ADA) and Architectural Barriers Act requirements. Despite these improvements, the proposed project to realign and redesign the Rincon Trail raises issues regarding grading and landform alteration, native vegetation communities, public access, and water quality. The entire project is located in the Coastal Zone, but spans both the jurisdiction of the City of Carpinteria (City) and County of Santa Barbara (County). Because the Commission has certified a LCP for both the City and County, the standard of review for the proposed project would be the respective LCP policies and provisions.

Grading and Landform Alteration

The previously approved project included 30,000 cubic yards of cut, 7,000 cubic yards of fill, and 23,000 cubic yards of export while the proposed realignment and redesign includes 104,000 cubic yards of cut, 10,300 cubic yards of fill and 94,100 cubic yards of export. This is a 77,300 cubic yard increase in the total amount of grading. The City's LCP contains Coastal Act Section 30251, which requires that

the scenic and visual qualities of coastal areas shall be considered and protected and that new development is sited and designed to minimize alteration of natural land forms and also subordinate to the character of its setting. The proposed project would significantly increase the amount of grading and landform alteration at the subject site. While grading impacts were analyzed in the draft SMND, it was determined that with the incorporation of mitigation measures the proposed project would not result in any significant impacts as a result of grading. However, in order to determine consistency with the certified LCP, siting and design alternatives to minimize grading and landform alteration must be analyzed. Furthermore, because the previously approved project would require significantly less grading, it appears that there are other feasible design alternatives that minimize the amount of grading and landform alteration consistent with Coastal Act Section 30251.

ESHA

Coastal Act Section 30240, which is incorporated into the City's LCP, requires that Environmentally Sensitive Habitat Areas (ESHA) be protected to the maximum extent feasible. The draft SMND includes an analysis of temporary and permanent impacts to various vegetation communities; however, the analysis should specifically identify and analyze potential impacts to ESHA and should evaluate project alternatives that would avoid impacts to the maximum extent feasible. Only if no feasible project alternative exists for avoidance then the alternative that minimizes impacts to the maximum extent feasible should be selected and mitigation should be required.

Public Access

The previously approved project included the construction of 17 public parking spaces and a rest area with picnic tables at the western terminus of the Rincon Trail, located along Carpinteria Avenue. However, the proposed redesign and realignment does not include the construction of these public access amenities, and the draft SMND indicates that instead, the existing dirt lot would continue to provide informal parking. However, based upon the information included within the SMND, it is unclear which portions of the dirt areas along Carpinteria Avenue are intended to function as parking for the proposed trail, and if those areas are actually available for public use. In order to facilitate maximum public access to the Rincon Trail, and to ensure consistency with the public access policies of the LCP, the final SMND should analyze project alternatives that include construction of the previously approved, or similar, public access components.

Water Quality

The draft SMND states that because there are no parking lots or other facilities that would result in the creation of impervious surfaces , the project would be considered exempt from post-construction water quality control requirements pursuant to California Central Coast Regional Water Quality Control Board Resolution No. R3-2013-0032. As such, the previously approved storm drainage collection system, including the on-site bioswale and a 5,000 gallon cistern, are no longer proposed. Instead, the proposed project would include a drainage system that would convey storm water run-off from the trail surface to the ocean via outfalls. No storm water treatment components are proposed. Section 30231 of the Coastal Act, as incorporated into the City's LCP, requires development to maintain the quality of coastal waters through minimizing the adverse effects of waste water discharges and entrainment and controlling runoff. In order to ensure consistency with the City's LCP, the final SMND should include an analysis of project alternatives that incorporate storm water treatment components that would prevent untreated storm water from being released directly into the marine environment.

Each of the issues identified in this letter, as well as other impacts identified in the environmental review process, should be analyzed in the context of alternative project designs. As described above, an analysis of project alternatives is critical to ensure that adverse impacts to coastal resources are avoided to the maximum extent feasible, and that unavoidable impacts are minimized and mitigated. Please note that the comments provided herein are preliminary in nature. More specific comments may be appropriate as the project develops, and Coastal Commission staff requests notification of any future activity associated with this project or related projects. Again, thank you for the opportunity to comment.

Thank you for your consideration of our comments.

Sincerely,

Wesley Horn

Re: Carpinteria Rincon Multi-Use Trail Notice of Preparation for an Environmental Impact Report

Dear Mr. Bobroff:

The County of Santa Barbara Planning and Development Department reviewed the Notice of Preparation (NOP) for the Carpinteria Rincon Multi-Use Trail and appreciates the opportunity to provide the comments listed below.

1. **Project Description**
   - The project description should include a list of agencies and permit approvals necessary to implement the proposed project.
   - Please include the expected parking demand and proposed parking improvements. If none are proposed, please substantiate this decision.
   - Please outline the proposed maintenance plan and/or agreement between jurisdictions for the trail.
   - Please describe how bike and pedestrian trail users will safely traverse through the Rincon Beach parking lot and avoid conflict with vehicles in the parking lot (i.e. separated pathway for bikes and pedestrians, striping, etc.). Consider a pathway connection parallel to the parking lot.

2. **Trail Location**
   - The alternatives analysis should include alternative trail alignments, and weigh the ocean view versus required earthwork for the proposed alignment.
   - Provide any quantitative analysis for the impacts to wind patterns and best alternatives, if any.

3. **Landscape**
   - Please outline a basic landscape and irrigation plan and confirm how irrigation will be provided.
   - Identify an anticipated native plant palette for landscaping.

4. General

- Please ensure the EIR is circulated to UPPR for their review and comments.
- Please provide the anticipated impacts to existing vegetation and habitat communities resulting from the project.
- Please confirm that local and County Emergency services have reviewed and are satisfied with the proposed project plan, including the proposed bridge.
- Please provide additional detail in the EIR on the proposed storm drains to address visual impacts, including photosimulations and/or further aesthetic analysis. Please indicate their size, length and any other relevant information.
- The EIR should use the Santa Barbara County Environmental Thresholds in addition to those used by the City of Carpinteria. The County Environmental Thresholds Manual can be found here: https://www.countyofsb.org/plndev/permitting/environmentalreview.sbc
- The County's permit will include a policy consistency analysis with the County's Comprehensive Plan. The EIR should provide information throughout the document, and specifically in the Land Use section, to address the relevant County policies, including:

Recreation

- **Coastal Land Use Plan Policy 7-33**: To encourage walking and biking as alternatives to travel by automobile, the County shall strongly encourage development of new pedestrian and/or bicycle-friendly paths along the highway corridor. Improvements to Highway 101 shall not remove existing bikeways or pedestrian paths or preclude the development of proposed bikeways or pedestrian paths that are identified in the County's Comprehensive Plan, Coastal Land Use Plan and community plans, without providing comparable or better replacement facilities.

- **Coastal Act 30211**. Development shall not interfere with the public's right of access to the sea where acquired through use, custom, or legislative authorization, including, but not limited to, the use of dry sand and rocky coastal beaches to the first line of terrestrial vegetation.

- **Coastal Act Policy 30252**. The location and amount of new development should maintain and enhance public access to the coast by: (1) facilitating the provision or extension of transit service; (2) providing commercial facilities within or adjoining residential development or in other areas that will minimize the use of coastal access roads; (3) providing non-automobile circulation within the development; (4) providing adequate parking facilities or providing substitute means of serving the development with public transportation; (5) assuring the potential for public transit for high-intensity uses such as high-rise office buildings, and by (6) assuring that the recreational needs of new residents will not- overload nearby coastal recreation areas by correlating the amount of development with local park acquisition and development plans with the provision of on-site recreational facilities to serve the new development.

- **Coastal Act Policy 30210**. In carrying out the requirement of Section 4 of Article X of the California Constitution, maximum access, which shall be conspicuously posted, and recreational opportunities shall be provided for all the people consistent with public safety needs and the need to protect public rights, rights of private property owners and natural resource areas from overuse.

- **Coastal Act Policy 30212.5** Wherever appropriate and feasible, public-facilities, including parking areas or facilities, shall be distributed throughout an area so as to mitigate against the impacts, social and otherwise, of overcrowding or overuse by the public of any single area.

- **Coastal Act Policy 30213**. Lower cost visitor and recreational facilities shall be protected, encouraged, and, where feasible, provided. Developments providing public recreational opportunities are preferred.

- **CLUP Policy 7-8**: Increased opportunities for beach access shall be provided in the Carpinteria planning area.

Geologic:

- **CLUP Policy 3-13:** Plans for development shall minimize cut and fill operations. Plans requiring excessive cutting and filling may be denied if it is determined that the development could be carried out with less alteration of the natural terrain.

- **CLUP Policy 3-14:** All development shall be designed to fit the site topography, soils, geology, hydrology, and any other existing conditions and be oriented so that grading and other site preparation is kept to an absolute minimum. Natural features, landforms, and native vegetation, such as trees, shall be preserved to the maximum extent feasible. Areas of the site which are not suited for development because of known soil, geologic, flood, erosion or other hazards shall remain in open space.

Environmentally Sensitive Habitat:

- **Coastal Act Policy 30240 (b).** Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade such areas, and shall be compatible with the continuance of such habitat areas.

Visual:

- **Coastal Act Policy 30251.** The scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance. Permitted development shall be sited and designed to protect views to and along the ocean and scenic coastal areas, to minimize the alteration of natural land forms, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas.

- **CLUP Policy 4-3:** In areas designated as rural on the land use plan maps, the height, scale, and design of structures shall be compatible with the character of the surrounding natural environment, except where technical requirements dictate otherwise. Structures shall be subordinate in appearance to natural landforms; shall be designed to follow the natural contours of the landscape; and shall be sited so as not to intrude into the skyline as seen from public viewing places.

Transportation:

- **Circulation Element Policy 5C:** The County shall continue to develop programs that encourage the use of alternative modes of transportation including, but not limited to, an updated bicycle route plan, park and ride facilities, and transportation demand management ordinances.

5. Future Notices

- When they become available, please send a copy of the Draft EIR Notice of Completion, all notices of City decision-maker hearings regarding the project, and Final EIR Notice of Determination to:
    - Dan Klemann, Deputy Director of Long Range Planning, via email at dklemann@countyofsb.org or mail at 123 E. Anapamu Street, Santa Barbara, CA 93101.
    - Ciara Ristig, Senior Planner, via email at cristig@countyofsb.org or mail at 123 E. Anapamu Street, Santa Barbara, CA 93101
    - Tess Harris, Supervising Planner, via email at tharris@countyofsb.org or mail at 123 E. Anapamu Street, Santa Barbara, CA 93101

Thank you for the opportunity to provide comments on the NOP. If you have any questions or require further information, please contact me at (805) 568-2086 or Mr. Klemann at (805) 568-2072.

Regards,

Lisa Plowman

Subject: Carpinteria Rincon Multi-Use Trail
NOP Comments

Dear Mr. Bobroff,

Thank you for the opportunity to comment on the Notice of Preparation for the draft Environmental Impact Report for the Carpinteria Rincon Multi-Use Trail. Santa Barbara County Parks Division looks forward to the implementation of this key link in the California Coastal Trail between Carpinteria and Rincon Beach County Park. The Parks Division also looks forward in partnering with the City of Carpinteria and the Santa Barbara County Association of Governments in planning the continuation of this path to close a gap between this project and the multi-use path that begins at the Bates Road Highway 101 southbound onramp and continues south alongside the highway toward Ventura.

The County Parks Division comments on the NOP are as follows:

Transportation Section:
Upper Rincon Parking Lot
Although this project will provide significant benefit of direct bike and ped access between Carpinteria and Rincon Beach County Park, it will leave a gap in path continuity between the eastern endpoint of the project and the existing path that originates near the Bates Road southbound onramp and continues into Ventura County. The County Parks Rincon upper parking lot is situated between the two path endpoints however it is not intended nor designed to be a throughway for bicyclists and other trail users connecting through, particularly with the two paths at each end serving as key links in the popular California Coastal Trail. Accordingly, the Parks Division requests the DEIR require development of a plan that includes milestones and identifies responsible parties to implement a multi-use path that would parallel the parking lot to provide a separate route for trail users.

Also, for clarity, the Existing Trail Network figure should be revised to demarcate the segment along the upper Rincon parking lot as "Future Trail" rather than as part of the project as "Proposed Trail."

Emergency Access
The Parks Division requests the DEIR indicate the type of emergency vehicles that can utilize the proposed bridge. If it is not proposed to be rated for all standard types of emergency vehicles, the impact analysis should assess response times including the ability to access an emergency from either

the Carpinteria Ave trailhead or from the Rincon Parking lot depending on the location of the emergency along the path whether it be an accident, crime activity or fire.

Air Quality, Noise, Recreation and Transportation Sections:
The NOP indicates 94,100 cubic yards of earth material will need to be exported off site for construction activities which according to the proposed final MND will require approximately 5,880 dump truck round trips. It is assumed doubling that number to 11,760 would account for the total number of one way dump truck trips to be either entering or leaving the project site.

In order to assess the impact of truck trips that will use the upper Rincon parking lot, the Parks Division requests this figure be split between total number of trips necessary to access the project site west of the railroad (City jurisdiction) and of total number of truck trips necessary to access east of the railroad (County jurisdiction) through the Rincon parking lot. The impact analysis should also include assessing the expected number of days of the week (if possible) and which months of the year the dump trucks will need to access the project site through the Rincon parking lot.

The analysis should evaluate the impact of dump truck trips on users of the Rincon Park grassy recreational picnic area located adjacent to the upper parking lot and to beach goers using the beach below with respect to air quality, noise, recreation including beach access and transportation (parking) and how it can be mitigated. If parking stalls are proposed to be used for staging if no other staging location is possible, Parks Division also requests the analysis assess the impacts with mitigations of potentially increased parking demand to the lower Rincon Point Parking lot and the parking along Bates Road as a result.

The Parks Division requests mitigation include not allowing construction to occur during the weekends during the busier November to March months and assessing the use of larger dump trucks if possible to lessen the amount of overall trips.

Aesthetics Section:
The NOP indicates that three vertical storm drains are proposed to be installed down the County Park bluff face below the proposed path in addition to the two other storm drains that already exist. The Parks Division requests the DEIR assess the aesthetic impacts and mitigations of the storm drains to trail users, beachgoers and those recreating in the ocean (e.g., surfers, boaters). Photo renditions should include directly facing the bluff, farther down the beach such as to the east near Rincon Point and to the west at the beach below the Carpinteria Bluffs Nature Preserve, and from a trail user's view walking east along the higher grade toward the proposed bridge to ascertain the level of impact.

Utilities and Service Systems:
Regarding the dumping of excess earth material from excavation, please note that Rincon Beach cannot be used as a dumping site due to the popular use of the beach.

I can be reached at (805) 568-2475 if you have any questions.

Sincerely

Jeffrey Lindgren

Construction Site Well Review (CSWR) ID: 1012181

Assessor Parcel Number(s): 001220100, 001010032, 001220092, 001220101

Property Owner(s): Mulitple property owners

Project Location Address: City of Carpinteria/County of Santa Barbara, California, 93013

Project Title: Carpinteria Rincon Multi-Use Trail SCH Number 2020100582

Public Resources Code (PRC) § 3208.1 establishes well reabandonment responsibility when a previously plugged and abandoned well will be impacted by planned property development or construction activities. Local permitting agencies, property owners, and/or developers should be aware of, and fully understand, that significant and potentially dangerous issues may be associated with development near oil, gas, and geothermal wells.

The Division of Oil, Gas, and Geothermal Resources (Division) has received and reviewed the above referenced project dated 11/6/2020. To assist local permitting agencies, property owners, and developers in making wise land use decisions regarding potential development near oil, gas, or geothermal wells, the Division provides the following well evaluation.

The project is located in Santa Barbara County, within the boundaries of the following fields:

Any Field

One well is currently projected to be built over, "Dr. R. W. Hill" 1 (API: 0408304847). CalGEM recommends locating this well and leak testing it prior to any development.

Please note CalGEM well locations are approximate. "Well No." 1 (API: 0408304324) is currently shown to be under Highway 101, 150 feet northeast of the proposed project. This well may be closer to the project location.

Our records indicate there are 1 known oil or gas wells located within the project boundary as identified in the application.

- Number of wells Not Abandoned to Current Division Requirements as Prescribed by Law and Projected to Be Built Over or Have Future Access Impeded by this project: 1
- Number of wells Not Abandoned to Current Division Requirements as Prescribed by Law and Not Projected to Be Built Over or Have Future Access Impeded by this project: 0

Gavin Newsom, Governor
David Shabazian, Director
801 K Street, MS 18-05
Sacramento, CA 95814
T: (916) 445-9686

- Number of wells Abandoned to Current Division Requirements as Prescribed by Law and Projected to Be Built Over or Have Future Access Impeded by this project: 0
- Number of wells Abandoned to Current Division Requirements as Prescribed by Law and Not Projected to Be Built Over or Have Future Access Impeded by this project: 0

The Division categorically advices against building over, or in any way impeding access to, oil, gas, or geothermal wells. Impeding access to a well could result in the need to remove any structure or obstacle that prevents or impedes access including, but not limited to, buildings, housing, fencing, landscaping, trees, pools, patios, sidewalks, roadways, and decking. Maintaining sufficient access is considered the ability for a well servicing unit and associated necessary equipment to reach a well from a public street or access way, solely over the parcel on which the well is located. A well servicing unit, and any necessary equipment, should be able to pass unimpeded along and over the route, and should be able to access the well without disturbing the integrity of surrounding infrastructure.

There are no guarantees a well abandoned in compliance with current Division requirements as prescribed by law will not start leaking in the future. It always remains a possibility that any well may start to leak oil, gas, and/or water after abandonment, no matter how thoroughly the well was plugged and abandoned. The Division acknowledges wells plugged and abandoned to the most current Division requirements as prescribed by law have a lower probability of leaking in the future, however there is no guarantees that such abandonments will not leak.

The Division advises that all wells identified on the development parcel prior to, or during, development activities be tested for liquid and gas leakage. Surveyed locations should be provided to the Division in Latitude and Longitude, NAD 83 decimal format. The Division expects any wells found leaking to be reported to it immediately.

Failure to plug and reabandon the well may result in enforcement action, including an order to perform reabandonment well work, pursuant to PRC § 3208.1, and 3224.

PRC § 3208.1 give the Division the authority to order or permit the re-abandonment of any well where it has reason to question the integrity of the previous abandonment, or if the well is not accessible or visible. Responsibility for re-abandonment costs may be affected by the choices made by the local permitting agency, property owner, and/or developer in considering the general advice set forth in this letter. The PRC continues to define the person or entity responsible for reabandonment as:

1. The property owner - If the well was plugged and abandoned in conformance with Division requirements at the time of abandonment, and in its current condition does not pose an immediate danger to life, health, and property, but requires additional work solely because the owner of the property on which the well is located proposes construction on the property that would prevent or impede access to the well for purposes of remedying a currently perceived future problem, then the owner of the property on which the well is located shall obtain all

Gavin Newsom, Governor
David Shabazian, Director
801 K Street, MS 18-05
Sacramento, CA 95814
T: (916) 445-9686

rights necessary to reabandon the well and be responsible for the reabandonment.

2. The person or entity causing construction over or near the well - If the well was plugged and abandoned in conformance with Division requirements at the time of plugging and abandonment, and the property owner, developer, or local agency permitting the construction failed either to obtain an opinion from the supervisor or district deputy as to whether the previously abandoned well is required to be reabandoned, or to follow the advice of the supervisor or district deputy not to undertake the construction, then the person or entity causing the construction over or near the well shall obtain all rights necessary to reabandon the well and be responsible for the reabandonment.

3. The party or parties responsible for disturbing the integrity of the abandonment - If the well was plugged and abandoned in conformance with Division requirements at the time of plugging and abandonment, and after that time someone other than the operator or an affiliate of the operator disturbed the integrity of the abandonment in the course of developing the property, then the party or parties responsible for disturbing the integrity of the abandonment shall be responsible for the reabandonment.

No well work may be performed on any oil, gas, or geothermal well without written approval from the Division. Well work requiring approval includes, but is not limited to, mitigating leaking gas or other fluids from abandoned wells, modifications to well casings, and/or any other re-abandonment work. The Division also regulates the top of a plugged and abandoned well's minimum and maximum depth below final grade. CCR §1723.5 states well casings shall be cut off at least 5 feet but no more than 10 feet below grade. If any well needs to be lowered or raised (i.e. casing cut down or casing riser added) to meet this regulation, a permit from the Division is required before work can start.

The Division makes the following additional recommendations to the local permitting agency, property owner, and developer:

1. To ensure that present and future property owners are aware of (a) the existence of all wells located on the property, and (b) potentially significant issues associated with any improvements near oil or gas wells, the Division recommends that information regarding the above identified well(s), and any other pertinent information obtained after the issuance of this letter, be communicated to the appropriate county recorder for inclusion in the title information of the subject real property.

2. The Division recommends that any soil containing hydrocarbons be disposed of in accordance with local, state, and federal laws. Please notify the appropriate authorities if soil containing significant amounts of hydrocarbons is discovered during development.

As indicated in PRC § 3106, the Division has statutory authority over the drilling, operation,

Gavin Newsom, Governor
David Shabazian, Director
801 K Street, MS 18-05
Sacramento, CA 95814
T: (916) 445-9686

maintenance, and abandonment of oil, gas, and geothermal wells, and attendant facilities, to prevent, as far as possible, damage to life, health, property, and natural resources; damage to underground oil, gas, and geothermal deposits; and damage to underground and surface waters suitable for irrigation or domestic purposes. In addition to the Division's authority to order work on wells pursuant to PRC §§ 3208.1 and 3224, it has authority to issue civil and criminal penalties under PRC §§ 3236, 3236.5, and 3359 for violations within the Division's jurisdictional authority. The Division does not regulate grading, excavations, or other land use issues.

If during development activities, any wells are encountered that were not part of this review, the property owner is expected to immediately notify the Division's construction site well review engineer in the Coastal district office, and file for Division review an amended site plan with well casing diagrams. The District office will send a follow-up well evaluation letter to the property owner and local permitting agency.

Should you have any questions, please contact me at (805) 937-7246 or via email at Pat.Abel@conservation.ca.gov

Sincerely,

Pat Abel
Coastal District Deputy

Wells Not Abandoned to Current Division Requirements as Prescribed by Law & Projected to be Built Over or Have Future Access Impeded

The wells listed below are not abandoned to current Division requirements as prescribed by law, and based upon information provided, are projected to be built over or have future access impeded. **The Division expects these wells to be reabandoned in compliance with current California law, prior to development activities.**

API	Well Designation	Operator	Well Evaluations
0408304847	1	Dr. R. W. Hill	Based on current well location and the currently planned trail location this well is projected to have the multi-use trail constructed over it. Based on well records: 1. There is no record of an oil/gas zone plug (CCR § 1723.1) 2. There is no record of a freshwater plug (CCR § 1723.2) 3. There is no record of a casing shoe plug (CCR § 1723.3) 4. There is no record of a surface plug (CCR § 1723.5)

1.3 User Entered Comments & Non-Default Data

Carpinteria Rincon Trail - Santa Barbara-South of Santa Ynez Range County, Summer

Project Characteristics -

Land Use -

Construction Phase - Based on project description.

Off-road Equipment - CalEEmod defaults.

Off-road Equipment - Based on modeling from the Supplemental MND.

Off-road Equipment - Based on modeling from the Supplemental MND.

Off-road Equipment - Based on modeling from the Supplemental MND.

Off-road Equipment - Based on modeling from the Supplemental MND.

Off-road Equipment - Based on modeling from the Supplemental MND.

Trips and VMT - CalEEMod defaults. Odd trips were rounded up to account for whole round trips.

On-road Fugitive Dust - CalEEMod defaults.

Grading - Based on City provided data.

Architectural Coating - CalEEMod defaults.

Vehicle Trips - For maintenance, assumption of one trip per week.

Energy Use - No energy use.

Water And Wastewater - CalEEMod defaults.

Solid Waste - CalEEMod defaults.

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation - In accordance with SBCAPCD Rule 345.

Operational Off-Road Equipment - NA

1.3 User Entered Comments & Non-Default Data

Carpinteria Rincon Trail - Santa Barbara-South of Santa Ynez Range County, Winter

Project Characteristics -

Land Use -

Construction Phase - Based on project description.

Off-road Equipment - CalEEmod defaults.

Off-road Equipment - Based on modeling from the Supplemental MND.

Off-road Equipment - Based on modeling from the Supplemental MND.

Off-road Equipment - Based on modeling from the Supplemental MND.

Off-road Equipment - Based on modeling from the Supplemental MND.

Off-road Equipment - Based on modeling from the Supplemental MND.

Trips and VMT - CalEEMod defaults. Odd trips were rounded up to account for whole round trips.

On-road Fugitive Dust - CalEEMod defaults.

Grading - Based on City provided data.

Architectural Coating - CalEEMod defaults.

Vehicle Trips - For maintenance, assumption of one trip per week.

Energy Use - No energy use.

Water And Wastewater - CalEEMod defaults.

Solid Waste - CalEEMod defaults.

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation - In accordance with SBCAPCD Rule 345.

Operational Off-Road Equipment - NA

Project Name

Vegetation

Land Use Change - Net Sequestered Carbon

The project's changes in land use results in changes in CO_2 sequestration from the atmosphere which would not have been captured had there been no land-type change.

Future planting of trees within the project site will sequester CO_2 and is considered to result in a one-time carbon-stock change. Trees sequester CO_2 while they are actively growing.

Summary:

Carbon Loss				
Project Vegetation Land Use	**Vegetation Land Use Category Subtype**	**Net Loss (acres)**	**Loss of Sequestered CO_2 (MT CO_2)**
Forest Land	Scrub	10.70	153.01
Total			**153.01**

Carbon Gain				
Project Vegetation Land Use	**Vegetation Land Use Category Subtype**	**Net Loss (acres)**	**Loss of Sequestered CO_2 (MT CO_2)**
Forest Land	Scrub	11.45	163.74
Total			**163.74**

Total CO_2E emissions released (loss) (MT)	**153.01**
CO_2E sequestered from Net New Vegetation (gain) (MT)	**163.74**
Total CO_2E Released (loss - gain) (MT)	**-10.73**
Amortized Net Change of CO_2E over 30 years (MT/year)	**-0.36**

Project Name

Vegetation

Land Use Change - Loss of Sequestered Carbon

A development which changes land use type results in changes in CO_2 sequestration from the atmosphere which would not have been captured had there been no land-type change.

Equation:

Sequestered CO_2 (MT CO_2) = Σ_f ($SeqCO_2$)$_f$ x (area)$_f$ - Σ_i (SeqCO2)$_i$ x (area)$_i$

Where:

$SeqCO_2$ = mass of sequestered CO_2 per unit area (MT CO_2/acre)

area = area of land for specific land use type (acre)

f = index for final land use type

I = index for initial land use type

Default CalEEMod Factors

The mass of sequestered CO_2 per unit area (MT CO_2/acre) is dependent on the specific land use type. The program uses default CO_2 sequestration values from the California Climate Action Registry for each land use that will be preserved or created:

Vegetation Land Use Type	Vegetation Land Use Subtype	Biogenic CO_2 Emissions (MT CO_2/Acre)
Cropland	Cropland	6.2
Forest Land	Scrub	14.3
Forest Land	Trees	111
Grassland	Grassland	4.31
Wetlands	Wetlands	0
Others	Others	0

Notes:

Based on values indicated in IPCC Guidelines for National Greenhouse Gas Inventories (IPCC Guidelines). Available online at http://www.ipcc-nggip.iges.or.jp/public/2006gl/

Reference:

CalEEMod Users Guide, Appendix A Calculation Details (Section 11 Vegetation, pages 50-52)

Project Name

Calculations:

Project Vegetation Land Use	Vegetation Land Use Category	Vegetation Land Use Category Subtype	Initial Acres (acres)	Final Acres (acres)	Net Loss (acres)	Biogenic CO_2 Emissions (MT CO_2/Acre)	Sequestered CO_2 (MT CO_2)
Non-Native Woodland	Forest Land	Scrub	10.70	0.00	10.70	14.3	153.01
Total			**10.70**	**0.00**	**10.70**		**153.01**

Notes:

The default annual CO2 is calculated by multiplying total biomass (MT dry matter/acre) from IPCC data by the carbon fraction in plant material (0.47), then using the ratio of molecular weights (44/12) to convert from MT of carbon (C) to MT of carbon dioxide (CO2).

Vegetation Type

Vegetation types are defined by IPCC as follows:

Forest Land

This category includes all land with woody vegetation consistent with thresholds used to define Forest Land in the national greenhouse gas inventory. It also includes systems with a vegetation structure that currently fall below, but *in situ* could potentially reach the threshold values used by a country to define the Forest Land category.

Cropland

This category includes cropped land, including rice fields, and agro-forestry systems where the vegetation structure falls below the thresholds used for the Forest Land category.

Grassland

This category includes rangelands and pasture land that are not considered Cropland. It also includes systems with woody vegetation and other non-grass vegetation such as herbs and brushes that fall below the threshold values used in the Forest Land category. The category also includes all grassland from wild lands to recreational areas as well as agricultural and silvi-pastural systems, consistent with national definitions.

Wetlands

This category includes areas of peat extraction and land that is covered or saturated by water for all or part of the year (e.g., peatlands) and that does not fall into the Forest Land, Cropland, Grassland or Settlements categories. It includes reservoirs as a managed sub-division and natural rivers and lakes as unmanaged sub-divisions.

Area

The user must specify area of land in acres for specific final and initial land use types. These area changes include not only the area of land that will be converted to buildings, but also areas disrupted by the construction of utility corridors, water tank sites, and associated borrow and grading areas. Areas temporarily disturbed that will eventually recover to become vegetated will not be counted as vegetation removed as there is no net change in vegetation or land use.

This assumption facilitates the calculation as a yearly growth rate and CO2 removal rate does not have to be calculated. As long as the disturbed land will indeed return to its original state, this assumption is valid for time periods over 20 years.

Project Name

Vegetation

Land Use Change - Sequestered Carbon

A development which changes land use type results in changes in CO_2 sequestration from the atmosphere which would not have been captured had there been no land-type change.

Equation:

Sequestered CO_2 (MT CO_2) = Σ_f ($SeqCO_2$)$_f$ x (area)$_f$ - Σ_i (SeqCO2)$_i$ x (area)$_i$

Where:

$SeqCO_2$ = mass of sequestered CO_2 per unit area (MT CO_2/acre)

area = area of land for specific land use type (acre)

f = index for final land use type

I = index for initial land use type

Default CalEEMod Factors

The mass of sequestered CO_2 per unit area (MT CO_2/acre) is dependent on the specific land use type. The program uses default CO_2 sequestration values from the California Climate Action Registry for each land use that will be preserved or created:

Vegetation Land Use Type	Vegetation Land Use Subtype	Biogenic CO_2 Emissions (MT CO_2/Acre)
Cropland	Cropland	6.2
Forest Land	Scrub	14.3
Forest Land	Trees	111
Grassland	Grassland	4.31
Wetlands	Wetlands	0
Others	Others	0

Notes:

Based on values indicated in IPCC Guidelines for National Greenhouse Gas Inventories (IPCC Guidelines). Available online at http://www.ipcc-nggip.iges.or.jp/public/2006gl/

Reference:

CalEEMod Users Guide, Appendix A Calculation Details (Section 11 Vegetation, pages 50-52)

Project Name

Calculations:

Project Vegetation Land Use	Vegetation Land Use Category	Vegetation Land Use Category Subtype	Initial Acres (acres)	Final Acres (acres)	Net Loss (acres)	Biogenic CO_2 Emissions (MT CO_2/Acre)	Sequestered CO_2 (MT CO_2)
Non-Native Woodland	Forest Land	Scrub	11.45	0.00	11.45	14.3	163.74
Total			**11.45**	**0.00**	**11.45**		**163.74**

Notes:

The default annual CO2 is calculated by multiplying total biomass (MT dry matter/acre) from IPCC data by the carbon fraction in plant material (0.47), then using the ratio of molecular weights (44/12) to convert from MT of carbon (C) to MT of carbon dioxide (CO2).

Vegetation Type

Vegetation types are defined by IPCC as follows:

Forest Land

This category includes all land with woody vegetation consistent with thresholds used to define Forest Land in the national greenhouse gas inventory. It also includes systems with a vegetation structure that currently fall below, but *in situ* could potentially reach the threshold values used by a country to define the Forest Land category.

Cropland

This category includes cropped land, including rice fields, and agro-forestry systems where the vegetation structure falls below the thresholds used for the Forest Land category.

Grassland

This category includes rangelands and pasture land that are not considered Cropland. It also includes systems with woody vegetation and other non-grass vegetation such as herbs and brushes that fall below the threshold values used in the Forest Land category. The category also includes all grassland from wild lands to recreational areas as well as agricultural and silvi-pastural systems, consistent with national definitions.

Wetlands

This category includes areas of peat extraction and land that is covered or saturated by water for all or part of the year (e.g., peatlands) and that does not fall into the Forest Land, Cropland, Grassland or Settlements categories. It includes reservoirs as a managed sub-division and natural rivers and lakes as unmanaged sub-divisions.

Area

The user must specify area of land in acres for specific final and initial land use types. These area changes include not only the area of land that will be converted to buildings, but also areas disrupted by the construction of utility corridors, water tank sites, and associated borrow and grading areas. Areas temporarily disturbed that will eventually recover to become vegetated will not be counted as vegetation removed as there is no net change in vegetation or land use.

This assumption facilitates the calculation as a yearly growth rate and CO2 removal rate does not have to be calculated. As long as the disturbed land will indeed return to its original state, this assumption is valid for time periods over 20 years.

Appendix C1

Plant and Wildlife Compendium

Plant Species

Eudicots – Vascular Species

ADOXACEAE—MUSKROOT FAMILY

Sambucus nigra ssp. *caerulea*—blue elderberry

AIZOACEAE—FIG-MARIGOLD FAMILY

* *Carpobrotus chilensis*—sea fig
* *Carpobrotus edulis*—hottentot fig
* *Mesembryanthemum crystallinum*—common iceplant
* *Tetragonia tetragonoides*—New Zealand spinach

AMARANTHACEAE—AMARANTH FAMILY

* *Amaranthus albus*—prostrate pigweed
Amaranthus blitoides—mat amaranth

ANACARDIACEAE—SUMAC OR CASHEW FAMILY

Rhus integrifolia—lemonade berry
* *Schinus terebinthifolius*—Brazilian peppertree

APIACEAE—CARROT FAMILY

Apiastrum angustifolium—mock parsley
* *Conium maculatum*—poison hemlock
* *Foeniculum vulgare*—fennel

ASTERACEAE—SUNFLOWER FAMILY

Ambrosia psilostachya—western ragweed
Artemisia californica—California sagebrush
Baccharis pilularis—coyote brush
Baccharis salicifolia—mulefat
Brickellia californica—California brickellbush
* *Carduus pycnocephalus*—Italian plumeless thistle
* *Centaurea melitensis*—Maltese star-thistle
Corethrogyne filaginifolia—sand-aster
* *Delairea odorata*—Cape-ivy
Encelia californica—California brittle bush
* *Erigeron bonariensis*—asthmaweed
Erigeron canadensis—Canadian horseweed
* *Erigeron sumatrensis*—asthmaweed
Eriophyllum confertiflorum—golden-yarrow
Hazardia squarrosa—sawtooth golden bush

* *Helminthotheca echioides*—bristly oxtongue
Heterotheca grandiflora—telegraphweed
Heterotheca sessiliflora—sessileflower false goldenaster
Isocoma menziesii—Menzies's golden bush
* *Lactuca serriola*—prickly lettuce
Malacothrix saxatilis var. *saxatilis*—cliff malacothrix
Pseudognaphalium beneolens—Wright's cudweed
Pseudognaphalium biolettii—two-color rabbit-tobacco
Pseudognaphalium californicum—ladies' tobacco
* *Pseudognaphalium luteoalbum*—Jersey cudweed
Pseudognaphalium ramosissimum—pink cudweed
* *Silybum marianum*—blessed milkthistle
* *Sonchus asper*—spiny sowthistle
* *Sonchus oleraceus*—common sowthistle
Venegasia carpesioides—canyon sunflower

BORAGINACEAE—BORAGE FAMILY

Amsinckia menziesii—Menzies' fiddleneck
Eriodictyon crassifolium—thick leaf yerba santa
Eucrypta chrysanthemifolia—spotted hideseed
Phacelia ramosissima var. *austrolitoralis*—south coast branching phacelia

BRASSICACEAE—MUSTARD FAMILY

* *Brassica nigra*—black mustard
* *Brassica rapa*—field mustard
* *Brassica tournefortii*—Tournefort's mustard
* *Cakile maritima*—European searocket
* *Capsella bursa-pastoris*—shepherd's purse
Descurainia pinnata—western tansymustard
* *Hirschfeldia incana*—shortpod mustard
Lepidium nitidum—shining pepperweed
* *Lobularia maritima*—sweet alyssum
* *Raphanus sativus*—cultivated radish
* *Sisymbrium irio*—London rocket
* *Sisymbrium orientale*—Indian hedgemustard

CACTACEAE—CACTUS FAMILY

Opuntia littoralis—coast prickly pear

CARYOPHYLLACEAE—PINK FAMILY

* *Spergularia bocconi*—Boccone's sandspurry

CHENOPODIACEAE—GOOSEFOOT FAMILY

Atriplex lentiformis—quailbush
* *Atriplex semibaccata*—Australian saltbush
* *Bassia hyssopifolia*—fivehorn smotherweed
* *Chenopodium album*—lambsquarters
* *Chenopodium murale*—nettleleaf goosefoot
* *Salsola tragus*—prickly Russian thistle
Suaeda taxifolia—woolly seablite

CONVOLVULACEAE—MORNING-GLORY FAMILY

Calystegia macrostegia ssp. *cyclostegia*—island false bindweed
* *Convolvulus arvensis*—field bindweed

EUPHORBIACEAE—SPURGE FAMILY

Croton californicus—California croton
Croton setiger—dove weed
* *Euphorbia peplus*—petty spurge
* *Ricinus communis*—castorbean

FABACEAE—LEGUME FAMILY

Acmispon americanus—Spanish clover
Acmispon glaber—deer weed
* *Medicago polymorpha*—burclover
* *Melilotus indicus*—annual yellow sweetclover
* *Melilotus officinalis*—sweetclover

FAGACEAE—OAK FAMILY

Quercus agrifolia—coast live oak

GERANIACEAE—GERANIUM FAMILY

* *Erodium botrys*—longbeak stork's bill
* *Erodium cicutarium*—redstem stork's bill
* *Erodium moschatum*—musky stork's bill

LAMIACEAE—MINT FAMILY

* *Marrubium vulgare*—horehound
Stachys bullata—California hedgenettle

MALVACEAE—MALLOW FAMILY

* *Malva nicaeensis*—bull mallow
* *Malva parviflora*—cheeseweed mallow

MYRSINACEAE—MYRSINE FAMILY

* *Lysimachia arvensis*—scarlet pimpernel

MYRTACEAE—MYRTLE FAMILY

* *Eucalyptus camaldulensis*—river redgum

NYCTAGINACEAE—FOUR O'CLOCK FAMILY

Mirabilis laevis var. *crassifolia*—California four o'clock

ONAGRACEAE—EVENING PRIMROSE FAMILY

Camissoniopsis bistorta—southern suncup

OXALIDACEAE—OXALIS FAMILY

* *Oxalis pes-caprae*—Bermuda buttercup

PHRYMACEAE—LOPSEED FAMILY

Diplacus aurantiacus—bush monkeyflower

PLANTAGINACEAE—PLANTAIN FAMILY

Plantago erecta—dwarf plantain

* *Plantago lanceolata*—narrowleaf plantain

PLATANACEAE—PLANE TREE, SYCAMORE FAMILY

Platanus racemosa—California sycamore

PLUMBAGINACEAE—LEADWORT FAMILY

* *Limonium perezii*—Perez's sea lavender

POLYGONACEAE—BUCKWHEAT FAMILY

Eriogonum parvifolium—seacliff buckwheat

* *Polygonum aviculare*—prostrate knotweed

RHAMNACEAE—BUCKTHORN FAMILY

Rhamnus crocea—redberry buckthorn

SALICACEAE—WILLOW FAMILY

Salix laevigata—red willow

Salix lasiolepis—arroyo willow

SCROPHULARIACEAE—FIGWORT FAMILY

* *Myoporum laetum*—myoporum

Scrophularia californica—California figwort

SOLANACEAE—NIGHTSHADE FAMILY

Datura wrightii—sacred thorn-apple
* *Nicotiana glauca*—tree tobacco
Solanum americanum—American black nightshade
Solanum douglasii—greenspot nightshade
Solanum xanti—chaparral nightshade

TROPAEOLACEAE—NASTURTIUM FAMILY

* *Tropaeolum majus*—nasturtium

URTICACEAE—NETTLE FAMILY

* *Urtica urens*—dwarf nettle

VERBENACEAE—VERVAIN FAMILY

Verbena lasiostachys—western vervain

Gymnosperms and Gnetophytes – Vascular Species

ARAUCARIACEAE— ARAUCARIANS FAMILY

Araucaria heterophylla—Norfolk Island pine

CUPRESSACEAE—CYPRESS FAMILY

Hesperocyparis macrocarpa—Monterey cypress

PINACEAE—PINE FAMILY

Pinus sp.—Pine tree

Monocots – Vascular Species

ASPHODELACEAE—ASPHODEL FAMILY

* *Asphodelus fistulosus*—onionweed

POACEAE—GRASS FAMILY

* *Avena barbata*—slender oat
* *Brachypodium distachyon*—purple false brome
* *Bromus diandrus*—ripgut brome
* *Bromus hordeaceus*—soft brome
* *Bromus madritensis*—compact brome
* *Cortaderia jubata*—purple pampas grass
* *Cynodon dactylon*—Bermudagrass
* *Ehrharta calycina*—perennial veldtgrass
Elymus condensatus—giant wild rye

* *Festuca myuros*—rat-tail fescue
* *Festuca perennis*—perennial rye grass
* *Hordeum murinum*—mouse barley
* *Lamarckia aurea*—goldentop grass
  Melica imperfecta—smallflower melicgrass
* *Pennisetum setaceum*—fountain grass
* *Pennisetum villosum*—feathertop
* *Poa annua*—annual bluegrass
* *Polypogon monspeliensis*—annual rabbitsfoot grass
* *Schismus arabicus*—Arabian schismus
* *Stipa miliacea*—no common name

* signifies introduced (non-native) species

Wildlife Species

Birds

AEGITHALIDAE—LONG-TAILED TITS AND BUSHTITS

Psaltriparus minimus—bushtit

CARDINALIDAE—CARDINALS AND ALLIES

Pheucticus melanocephalus—black-headed grosbeak

FALCONIDAE—CARACARAS AND FALCONS

Falco peregrinus anatum—American peregrine falcon

Falco sparverius—American kestrel

FRINGILLIDAE—FRINGILLINE AND CARDUELINE FINCHES AND ALLIES

Haemorhous mexicanus—house finch

Spinus psaltria—lesser goldfinch

TYRANNIDAE—TYRANT FLYCATCHERS

Sayornis nigricans—black phoebe

Sayornis saya—Say's phoebe

ACCIPITRIDAE—HAWKS, KITES, EAGLES AND ALLIES

Buteo jamaicensis—red-tailed hawk

TROCHILIDAE—HUMMINGBIRDS

Calypte anna—Anna's hummingbird

CORVIDAE—CROWS AND JAYS

Corvus brachyrhynchos—American crow

CATHARTIDAE—NEW WORLD VULTURES

Cathartes aura—turkey vulture

SYLVIIDAE—SYLVIID WARBLERS

Polioptila caerulea—blue-gray gnatcatcher

COLUMBIDAE—PIGEONS AND DOVES

Zenaida macroura—mourning dove

* *Streptopelia decaocto*—Eurasian collared-dove

CUCULIDAE—CUCKOOS, ROADRUNNERS AND ANIS

Geococcyx californianus—greater roadrunner

MIMIDAE—MOCKINGBIRDS AND THRASHERS

Toxostoma redivivum—California thrasher

PASSERIDAE—OLD WORLD SPARROWS

* *Passer domesticus*—house sparrow

POLIOPTILIDAE—GNATCATCHERS

Polioptila caerulea—blue-gray gnatcatcher

STURNIDAE—STARLINGS

* *Sturnus vulgaris*—European starling

HIRUNDINIDAE—SWALLOWS

Hirundo rustica—barn swallow

LARIDAE—GULLS, TERNS AND SKIMMERS

Larus occidentalis—western gull

TROGLODYTIDAE—WRENS

Thryomanes bewickii—Bewick's wren

TIMALIIDAE—BABBLERS

Chamaea fasciata—wrentit

PASSERELLIDAE—NEW WORLD SPARROWS

Melospiza melodia—song sparrow

Melozone crissalis—California towhee

Zonotrichia leucophrys—white-crowned sparrow

Invertebrates

LYCAENIDAE—BLUES, HAIRSTREAKS AND COPPERS

Brephidium exile—western pygmy-blue

PIERIDAE—WHITES AND SULFURS

Pieris rapae—cabbage white

Mammals

LEPORIDAE—HARES AND RABBITS

Sylvilagus bachmani—brush rabbit

SCIURIDAE—SQUIRRELS

Spermophilus (*Otospermophilus*) *beecheyi*—California ground squirrel

CRICETIDAE—RATS, MICE AND VOLES

Neotoma sp.—woodrat

Reptiles

PHRYNOSOMATIDAE—IGUANID LIZARDS

Sceloporus occidentalis—western fence lizard

Uta stansburiana—common side-blotched lizard

* signifies introduced (non-native) species

INTENTIONALLY LEFT BLANK

Appendix C2

Plant and Wildlife Species Not Expected to Occur within the Biological Study Area

Special-Status Plant Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
Arenaria paludicola	marsh sandwort	FE/SE/1B.1	Marshes and swamps (freshwater or brackish); sandy, openings/perennial stoloniferous herb/May–Aug/10–560	Not expected to occur. Suitable marsh or swamp habitat is not present.
Astragalus pycnostachyus var. *lanosissimus*	Ventura marsh milk-vetch	FE/SE/1B.1	Coastal dunes, Coastal scrub, Marshes and swamps (edges, coastal salt or brackish)/perennial herb/(June)Aug–Oct/3–115	Not expected to occur. While suitable coastal scrub habitat is present, this species rarely occurs on sandy bluffs as compared to within coastal salt marsh margins or coastal dunes (CDFW 2020). There is only one occurrence in the region[2] which is considered possibly extirpated (CDFW 2020).
Calochortus fimbriatus	late-flowered mariposa lily	None/None/1B.3	Chaparral, Cismontane woodland, Riparian woodland; often serpentinite/perennial bulbiferous herb/June–Aug/902–6,250	Not expected to occur. The site is outside of the species' known elevation range. Additionally, suitable habitat is not present.
Calochortus palmeri var. *palmeri*	Palmer's mariposa lily	None/None/1B.2	Chaparral, Lower montane coniferous forest, Meadows and seeps; mesic/perennial bulbiferous herb/Apr–July/2,325–7,840	Not expected to occur. The site is outside of the species' known elevation range. Additionally, suitable habitat is not present.
Chloropyron maritimum ssp. *maritimum*	salt marsh bird's-beak	FE/SE/1B.2	Coastal dunes, Marshes and swamps (coastal salt)/annual herb (hemiparasitic)/May–Oct(Nov)/0–100	Not expected to occur. Suitable dune, marsh, or swamp habitat is not present.
Delphinium umbraculorum	umbrella larkspur	None/None/1B.3	Chaparral, Cismontane woodland/perennial herb/Apr–June/1,310–5,245	Not expected to occur. The site is outside of the species' known elevation range. Additionally, suitable habitat is not present.

Special-Status Plant Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
Fritillaria ojaiensis	Ojai fritillary	None/None/1B.2	Broadleafed upland forest (mesic), Chaparral, Cismontane woodland, Lower montane coniferous forest; rocky/perennial bulbiferous herb/Feb–May/738–3,270	Not expected to occur. The site is outside of the species' known elevation range. Additionally, suitable habitat is not present.
Lasthenia glabrata ssp. *coulteri*	Coulter's goldfields	None/None/1B.1	Marshes and swamps (coastal salt), Playas, Vernal pools/annual herb/Feb–June/3–4,000	Not expected to occur. Suitable vernal pool, playa, marsh, or swamp habitat is not present.
Layia heterotricha	pale-yellow layia	None/None/1B.1	Cismontane woodland, Coastal scrub, Pinyon and juniper woodland, Valley and foothill grassland; alkaline or clay/annual herb/Mar–June/984–5,590	Not expected to occur. The site is outside of the species' known elevation range. Additionally, only marginally suitable habitat is present.
Monardella hypoleuca ssp. *hypoleuca*	white-veined monardella	None/None/1B.3	Chaparral, Cismontane woodland/perennial herb/(Apr)May–Aug(Sep–Dec)/164–5,000	Not expected to occur. No suitable chaparral or woodland habitat present. Although this species is mapped along Rincon Creek all the way to the ocean just behind the project site, it is associated with the riparian habitat of the creek which is not present on site (CDFW 2020).
Nasturtium gambelii	Gambel's water cress	FE/ST/1B.1	Marshes and swamps (freshwater or brackish)/perennial rhizomatous herb/Apr–Oct/16–1,080	Not expected to occur. Suitable marsh or swamp habitat is not present.
Navarretia fossalis	spreading navarretia	FT/None/1B.1	Chenopod scrub, Marshes and swamps (assorted shallow freshwater), Playas, Vernal pools/annual herb/Apr–June/98–2,145	Not expected to occur. Although chenopod scrub habitat is present, vernal pools are absent within the project site. This species is not known to occur within the region[2] (CDFW 2020).

Special-Status Plant Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
Navarretia ojaiensis	Ojai navarretia	None/None/1B.1	Chaparral (openings), Coastal scrub (openings), Valley and foothill grassland/annual herb/May–July/902–2,030	Not expected to occur. The site is outside of the species' known elevation range.
Navarretia peninsularis	Baja navarretia	None/None/1B.2	Chaparral (openings), Lower montane coniferous forest, Meadows and seeps, Pinyon and juniper woodland; mesic/annual herb/(May)June–Aug/4,920–7,545	Not expected to occur. The site is outside of the species' known elevation range. Additionally, suitable habitat is not present.
Nolina cismontana	chaparral nolina	None/None/1B.2	Chaparral, Coastal scrub; sandstone or gabbro/perennial evergreen shrub/(Mar)May–July/459–4,180	Not expected to occur. The site is outside of the species' known elevation range.
Orcuttia californica	California Orcutt grass	FE/SE/1B.1	Vernal pools/annual herb/Apr–Aug/49–2,165	Not expected to occur. Suitable vernal pool habitat is absent within the project site. Additionally, this species is not known to occur within the region[2] (CDFW 2020).
Sagittaria sanfordii	Sanford's arrowhead	None/None/1B.2	Marshes and swamps (assorted shallow freshwater)/perennial rhizomatous herb (emergent)/May–Oct(Nov)/0–2,130	Not expected to occur. Suitable marsh or swamp habitat is not present. Additionally, the only one occurrence in the region[2] is considered extirpated (CDFW 2020).

Special-Status Plant Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
Sidalcea neomexicana	salt spring checkerbloom	None/None/2B.2	Chaparral, Coastal scrub, Lower montane coniferous forest, Mojavean desert scrub, Playas; alkaline, mesic/perennial herb/Mar–June/49–5,015	Low potential to occur. Suitable coastal scrub habitat is present, however mesic habitats such as springs or marshes are absent. The only occurrence in the region[2] was last confirmed in 1962 and is located in Oak View (CDFW 2020). This species was not detected during 2018 or 2019 special-status plant species surveys.
Streptanthus campestris	southern jewelflower	None/None/1B.3	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland; rocky/perennial herb/(Apr)May–July/2,950–7,545	Not expected to occur. The site is outside of the species' known elevation range. Additionally, suitable habitat is not present.
Thelypteris puberula var. *sonorensis*	Sonoran maiden fern	None/None/2B.2	Meadows and seeps (seeps and streams)/perennial rhizomatous herb/Jan–Sep/164–2,000	Not expected to occur. Suitable meadow or seep habitat is not present.

1 **Status Legend:**
FE: Federally listed as endangered
SE: State listed as endangered
CRPR 1A: Plants presumed extinct in California
CRPR 1B: Plants rare, threatened, or endangered in California and elsewhere
CRPR 2A: Plants rare, threatened, or endangered in California but common elsewhere
CRPR 2B: Plants rare, threatened, or endangered in California but more common elsewhere
CRPR 3: Plants about which more information is needed – a review list
CRPR 4: Plants of limited distribution – a watch list
.1 Seriously endangered in California (over 80% of occurrences threatened/high degree and immediacy of threat)
.2 Fairly endangered in California (20% to 80% of occurrences threatened)
.3 Not very endangered in California (less than 20% of occurrences threatened or no current threats known).

2 **Region:** "Region" refers to species recorded in the USGS 7.5-minute White Ledge Peak quadrangle, as well as the surrounding coastal quadrangles including Carpinteria, Pitas Point, Ventura, and Matilija (CDFW 2020; CNPS 2020).

Special-Status Wildlife Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
Amphibians				
Anaxyrus californicus	arroyo toad	FE/SSC	Semi-arid areas near washes, sandy riverbanks, riparian areas, palm oasis, Joshua tree, mixed chaparral and sagebrush; stream channels for breeding (typically third order); adjacent stream terraces and uplands for foraging and wintering	Not expected to occur. No suitable wash, riparian, or chaparral habitat present.
Rana boylii	foothill yellow-legged frog	None/SSC, SE	Rocky streams and rivers with open banks in forest, chaparral, and woodland	Not expected to occur. No suitable stream, river, forest, or chaparral habitat present.
Rana draytonii	California red-legged frog	FT/SSC	Lowland streams, wetlands, riparian woodlands, livestock ponds; dense, shrubby or emergent vegetation associated with deep, still or slow-moving water; uses adjacent uplands	Not expected to occur. No suitable stream, wetland, woodland, or pond habitat present.
Taricha torosa (Monterey Co. south only)	California newt	None/SSC	Wet forests, oak forests, chaparral, and rolling grassland	Not expected to occur. No suitable forest, chaparral, or grassland habitat present.
Reptiles				
Actinemys marmorata	northwestern pond turtle	None/SSC	Slow-moving permanent or intermittent streams, ponds, small lakes, and reservoirs with emergent basking sites; adjacent uplands used for nesting and during winter	Not expected to occur. No suitable stream, pond, or lake habitat present.
Thamnophis hammondii	two-striped gartersnake	None/SSC	Streams, creeks, pools, streams with rocky beds, ponds, lakes, vernal pools	Not expected to occur. No suitable stream, creek, or pool habitat present.

Special-Status Wildlife Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
Birds				
Agelaius tricolor (nesting colony)	tricolored blackbird	BCC/SSC, ST	Nests near freshwater, emergent wetland with cattails or tules, but also in Himalayan blackberrry; forages in grasslands, woodland, and agriculture	Not expected to occur. No suitable freshwater wetland habitat present.
Athene cunicularia (burrow sites & some wintering sites)	burrowing owl	BCC/SSC	Nests and forages in grassland, open scrub, and agriculture, particularly with ground squirrel burrows	Not expected to occur. No suitable open scrub, grassland, or agricultural habitat present.
Brachyramphus marmoratus (nesting)	marbled murrelet	FT/SE	Nests in old-growth coastal forests, forages in subtidal and pelagic habitats	Not expected to occur. No suitable old-growth forest habitat present.
Charadrius alexandrinus nivosus (nesting)	western snowy plover	FT, BCC/SSC	On coasts nests on sandy marine and estuarine shores; in the interior nests on sandy, barren or sparsely vegetated flats near saline or alkaline lakes, reservoirs, and ponds	Not expected to occur. No suitable marine/estuarine sandy shore, flat, lake, pond, or reservoir habitat present.
Empidonax traillii extimus (nesting)	southwestern willow flycatcher	FE/SE	Nests in dense riparian habitats along streams, reservoirs, or wetlands; uses variety of riparian and shrubland habitats during migration	Not expected to occur. No suitable riparian or wetland habitat present.
Falco peregrinus anatum (nesting)	American peregrine falcon	FDL, BCC/FP, SDL	Nests on cliffs, buildings, and bridges; forages in wetlands, riparian, meadows, croplands, especially where waterfowl are present	Not expected to nest. Suitable cliff nesting habitat is present, however the slopes and cliffs within the project area are subject to a high amount of human disturbance with walking trails and popular paragliding sites. This species has been known to nest along the south coast, with former nest sites including Gaviota Pass; San Onofre Canyon near Gaviota; Las Flores

Special-Status Wildlife Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
				Canyon; upper Mission Canyon, Santa Barbara; and Santa Monica Canyon behind Carpinteria (Lehman 2020).
Gymnogyps californianus	California condor	FE/FP, SE	Nests in rock formations, deep caves, and occasionally in cavities in giant sequoia trees (Sequoiadendron giganteus); forages in relatively open habitats where large animal carcasses can be detected	Not expected to occur. This species is not known to occur in coastal Santa Barbara County in recent history, and since the last resident pair in the County in the early 1980s, this species is largely restricted to the rural interior of the County primarily within the San Rafael Wilderness and in Sierra Madre. (Lehman 2020).
Passerculus sandwichensis beldingi	Belding's savannah sparrow	None/SE	Nests and forages in coastal saltmarsh dominated by pickleweed (Salicornia spp.)	Not expected to occur. No suitable saltmarsh habitat present.
Polioptila californica californica	coastal California gnatcatcher	FT/SSC	Nests and forages in various sage scrub communities, often dominated by California sagebrush and buckwheat; generally avoids nesting in areas with a slope of greater than 40%; majority of nesting at less than 1,000 feet above mean sea level	Not expected to occur. While coastal scrub habitat is present, this species is only known from one occurrence in the region[2] which was last observed in 1906 near Ventura (CDFW 2020).
Rallus obsoletus levipes	Ridgway's rail	FE/SE, FP	Coastal wetlands, brackish areas, coastal saline emergent wetlands	Not expected to occur. No suitable wetland present.
Setophaga petechia (nesting)	yellow warbler	BCC/SSC	Nests and forages in riparian and oak woodlands, montane chaparral, open ponderosa pine, and mixed-conifer habitats	Not expected to occur. No suitable riparian, woodland, forest, or chaparral habitat present.

Special-Status Wildlife Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
Sternula antillarum browni (nesting colony)	California least tern	FE/FP, SE	Forages in shallow estuaries and lagoons; nests on sandy beaches or exposed tidal flats	Not expected to occur. No suitable estuary or lagoon foraging habitat, or suitable beach nesting habitat present.
Vireo bellii pusillus (nesting)	least Bell's vireo	FE/SE	Nests and forages in low, dense riparian thickets along water or along dry parts of intermittent streams; forages in riparian and adjacent shrubland late in nesting season	Not expected to occur. No suitable riparian habitat present.
Fishes				
Eucyclogobius newberryi	tidewater goby	FE/None	Brackish water habitats along the California coast from Agua Hedionda Lagoon, San Diego County, to the mouth of the Smith River	Not expected to occur. No suitable aquatic habitat present.
Oncorhynchus mykiss irideus pop. 10	southern steelhead - southern California DPS	FE/None	Clean, clear, cool, well-oxygenated streams; needs relatively deep pools in migration and gravelly substrate to spawn	Not expected to occur. No suitable aquatic habitat present.
Mammals				
Antrozous pallidus	pallid bat	None/SSC	Grasslands, shrublands, woodlands, forests; most common in open, dry habitats with rocky outcrops for roosting, but also roosts in man-made structures and trees	Not expected to occur. While marginally suitable habitat is present, this species is known from only one occurrence in the region[2] which was recorded in 1906 (CDFW 2020).
Chaetodipus californicus femoralis	Dulzura pocket mouse	None/SSC	Open habitat, coastal scrub, chaparral, oak woodland, chamise chaparral, mixed-conifer habitats; disturbance specialist; 0 to 3,000 feet above mean sea level	Not expected to occur. The site is outside this species known geographic range, and is only known to occur as west as Ojai and/or Weldon (CDFW 2020).
Choeronycteris mexicana	Mexican long-tongued bat	None/SSC	Desert and montane riparian, desert succulent scrub, desert scrub, and pinyon–juniper woodland; roosts in caves, mines, and buildings	Not expected to occur. No suitable desert habitat present.

Special-Status Wildlife Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
Lasiurus cinereus	hoary bat	None/None	Forest, woodland riparian, and wetland habitats; also juniper scrub, riparian forest, and desert scrub in arid areas; roosts in tree foliage and sometimes cavities, such as woodpecker holes	Not expected to occur. No suitable trees for roosting habitat or wetland, woodland, riparian, or desert habitat for foraging present.
Taxidea taxus	American badger	None/SSC	Dry, open, treeless areas; grasslands, coastal scrub, agriculture, and pastures, especially with friable soils	Not expected to occur. While marginally suitable coastal scrub is present, the species is known from only one occurrence in the region[2] which is located inland near Foster Park and not along the coast (CDFW 2020).
Invertebrates				
Branchinecta lynchi	vernal pool fairy shrimp	FT/None	Vernal pools, seasonally ponded areas within vernal swales, and ephemeral freshwater habitats	Not expected to occur. No suitable vernal pool, vernal swale, or ephemeral freshwater habitat present.
Cicindela hirticollis gravida	sandy beach tiger beetle	None/None	Inhabits areas adjacent to non-brackish water along the coast of California from San Francisco Bay to northern Mexico	Not expected to occur. No suitable non-brackish aquatic habitat present or nearby.
Coelus globosus	globose dune beetle	None/None	Inhabitant of coastal sand dune habitat; erratically distributed from Ten Mile Creek in Mendocino County south to Ensenada, Mexico	Not expected to occur. No suitable dune habitat present.
Panoquina errans	wandering skipper	None/None	Saltmarsh	Not expected to occur. No suitable saltmarsh habitat present.

Special-Status Wildlife Species Not Expected to Occur within the Biological Survey Area

Scientific Name	Common Name	Regulatory Status[1]	Habitat Requirements	Potential to Occur within the BSA
Streptocephalus woottoni	Riverside fairy shrimp	FE/None	Vernal pools, non-vegetated ephemeral pools	Not expected to occur. No suitable vernal or ephemeral pool habitat present.

1.0 EXECUTIVE SUMMARY

Located in southeastern Santa Barbara County at the Ventura County line, the proposed Rincon Multi-Use Trail project consists of the construction of a 10-foot wide (meaning the width of travelled-way, not including paved shoulders), 2,750-foot long multi-use trail connecting the eastern terminus of Carpinteria Avenue to Rincon Beach County Park. The majority of the proposed trail route is located along and above southbound Highway 101, within the railroad track corridor, and along an existing coastal bluff bench (abandoned railroad bed) that is used as an unofficial trail on County property. Bengal explored and evaluated the subsurface soil conditions along the project trail alignment to provide geotechnical design and construction recommendations for the proposed multi-use trail improvements.

Our study focused on the following elements: field investigation, laboratory testing of soil and rock samples, remote sensing analysis, review of data from previous soils investigations within and adjacent to the project limits, data reduction, slope stability analyses, preparing design recommendations for the proposed trail, and preparation of this study report.

Site exploration was conducted by Bengal Engineering, Inc. in April, 2013 and March & August, 2018. Our field investigation consisted of geologic mapping within the project limits and subsurface investigation. A total of nine (9) backhoe test trenches, twenty-four (24) hand-dug test pits, and eight (8) large-diameter borings were excavated within the proposed Rincon Multi-Use Trail corridor. Representative samples of the earth materials encountered were obtained for subsequent laboratory testing.

The majority of the proposed trail alignment will traverse the face of relatively steep slopes consisting of a range of earth-materials, ranging from relatively high strength, granular soil or soil-like marine terrace deposits and Santa Barbara Formation to relatively low strength and slope failure prone Monterey and Sisquoc Formation bedrock.

The proposed trail will cross the surface trace of the Carpinteria fault, a high-angle, south-dipping reverse fault which trends north of west through the northern portion of the project limits. Work by others on the adjacent parcel(s) to the west suggests that additional faults may be present, though no evidence has been found to suggest that these faults or suspected faults have been active in the Holocene. The City of Carpinteria (2003) and other sources suggest that the Carpinteria Fault be considered “potentially active” (faults which show evidence of Quaternary displacement) for planning purposes. It is our opinion that the potential for fault surface rupture during the lifetime of the project is considered low.

Due to its location within a highly active seismic region with several large active faults nearby, the trail alignment is susceptible to relatively high ground motions due to earthquakes. The design PGA is estimated to be about 0.8g with a causative earthquake of moment magnitude, M_w=7.4.

Based on our field exploration and geologic mapping, the coastal bluff portion of the slope to be traversed by the proposed trail, especially the slope areas existing below the unsanctioned County trail (approx. Sta. 30+00 to 45+00) are most problematic. Areas of landslide debris and questionable landslide debris have been mapped along this section of the proposed trail corridor.

Construction of the proposed trail alignment involve cut and fill of the existing slopes. Our subsurface investigation, geologic mapping, laboratory testing and results of slope stability analyses indicate that, following the implementation of the remedial/stabilization measures recommended herein, the as-built slopes and trail alignment will be adequately stable against overall and surficial slope failures under the static or normal service conditions, in both short- and long-term conditions.

The recommended remedial/stabilization measures include: (1) cutting to flatten the slopes above the trail alignment, (2) removal and replacement of unsuitable surficial soils prior to placing new fill, (3) keying and benching the new fills into competent slope materials, (4) enhancing the stability of new fills by means of buttress and geotextile reinforcement, and (5) reducing surficial erosion hazards by controlling the collection and disposal of surface run-off via non-erosive surface drainage facilities and hydro-seeding.

Due to the relatively low shear strength of the constituent earth materials, the overall slope height, gradients and slope orientation, and the high design ground motion, the ocean-facing slope within the proposed trail alignment limits is considered susceptible to limited downslope sliding movement, estimated to be on the order of about twelve (12) inches in the event shaken by the design earthquake ground motion event.

The lower portion of the slope below the existing unsanctioned dirt trail, located outside the proposed grading area for the trail construction, is considered susceptible to further local/surficial instability in the future. Continued monitoring and maintenance of this portion of the slope, which if left unattended may progress with time and affect the stability of the subject trail in the future, is recommended.

A minimum pavement section consisting of five inches (5”) of Portland Cement Concrete (PCC) over four inches (4”) Class II Aggregate Base is recommended for the subject trail. Cast-in-drilled hole (CIDH) foundations may be used to support the proposed single-span trail bridge abutments. Hard drilling conditions may be encountered during drilling of the CIDH pile holes.

In summary, it is our opinion that the proposed project is geotechnically feasible provided the findings and recommendations included in this report are considered in the design and construction of the proposed improvements.

2.0 INTRODUCTION

This geotechnical report is prepared by Bengal Engineering, Inc. in support of the design and construction of the proposed Rincon Multi-Use Trail, located in and immediately adjacent to the southeast corner of the City of Carpinteria. The location of the project site and the approximate project limits are shown on Figures 1 and 2, respectively.

The proposed project consists of the construction of a 10-foot wide, approximately 2,750-foot long multi-use trail connecting the east end of Carpinteria Avenue to Rincon Beach County Park, located in Santa Barbara County at the Ventura County Line. As envisioned, the trail will provide critical, non-motorized access for both pedestrians and bicyclists and help eliminate many of the existing safety concerns for travel either along the Highway 101 shoulder or within the railroad corridor.

Bengal explored and evaluated the subsurface soil and bedrock conditions along the proposed trail alignment to provide geotechnical design and construction recommendations. This report is prepared as part of the scope of work to present the results of our site exploration and geotechnical analysis, and recommendations for the design and construction of the proposed improvements.

This report is for use solely by the City of Carpinteria for the specific project site and the proposed project elements or the scope of work described herein. Site exploration conducted, analysis performed, and findings, recommendations and conclusions contained in this report may not be adequate or appropriate for use by others, different project elements, and for any other project or purpose.

3.0 SCOPE OF WORK

The scope of work completed for this geotechnical report includes:

- A review of available publications, maps and reports prepared by others (see reference list).
- Review of historical aerial photos for the area on file at the University of California, Santa Barbara – Davidson Library, Map and Imagery Laboratory.
- Historical document review of railroad construction details at the Santa Barbara Historical Museum.
- Several site visits, geologic reconnaissance and mapping within the project limits.
- Excavation, logging and sampling of eight (8) large-diameter borings, twenty-four (24) hand-excavated test pits, and nine (9) backhoe-excavated test trenches along the trail alignment.
- Preparation of geologic maps (Plates A & B, Appendix A) and representative cross-sections (Plates C & D, Appendix A).
- Preparation of the site exploration boring, test pit and test trench logs (Appendix B).
- Laboratory testing of representative samples of the subsurface geomaterials (Appendix C).
- Review of subsurface geologic conditions
- Field and laboratory data evaluation and interpretation to determine geomaterial types and their generalized geologic and geotechnical characteristics.
- Performing various geotechnical engineering analyses; including slope stability analyses (Appendix D), and the
- Preparation of this geotechnical study report.

In preparing this report, we also reviewed the proposed project details shown on the latest civil engineering plans attached in Appendix E.

4.0 PROPOSED PROJECT

The proposed project consists of the construction of a 2,750-foot long multi-use trail connecting the eastern terminus of Carpinteria Avenue to Rincon Beach County Park, located in Santa Barbara County at the Ventura County Line (see Figure 1). As envisioned, the trail is to consist of 10-foot wide paved travel-way with a 3-foot wide paved shoulder along each side. The proposed trail route is located along and above the Rincon Road onramp to southbound (SB) Highway 101, within the Union Pacific Railroad (UPRR) track corridor, and along an existing bench (abandoned railroad bed) that is used as an unofficial trail on County property. Most of the area within and along the project limits, including both the bluff top and adjacent slopes, has been graded over the years.

The proposed trail will provide a dedicated connection for pedestrians and bicyclists from Carpinteria Avenue to the Ventura County line through Rincon Beach County Park. The alignment would begin just south of the intersection of Rincon Road (Hwy 150) and the Highway 101 southbound on-ramp. The trail alignment continues east/southeast above and alongside SB Highway 101, descending on a northeast-facing cut slope above the southbound 101 on-ramp towards Rincon Point. As the trail approaches the highway shoulder and the southbound 101 overhead (OH) bridge the alignment turns slightly southward to span over the depressed UPRR railroad track corridor via a proposed 160-foot span, pre-fabricated trail bridge. After crossing the railroad tracks, the trail tums and, through a combination of cut and fill grading, descends across a southwest-facing cut slope above a relatively flat bench and beach below. Up until the early 1970's the bench was the previous railroad corridor / track alignment and is currently an unsanctioned, or unofficial, trail leading from the County Park parking lot to railroad tracks. The proposed trail will terminate at the western end of the Rincon Beach County Park parking lot.

Bengal is also providing civil trail and bridge structural engineering design for the Rincon Multi-Use Trail, including the preparation of plans/profiles, grading plans and cross sections. This geotechnical report addresses the proposed improvements shown on these plans. Station call-outs in this report are based on the most recent trail alignment shown on these plans

The current design concept emphasizes a grading approach, involving mostly cut and some fill, in the design and construction of the proposed trail. The proposed construction of fill slopes along the bluff portion of the trail will require the removal and re-compaction and keying/benching into competent materials prior to the placement of compacted fill.

5.0 PHYSICAL SETTING

The proposed Rincon Multi-Use Trail is located at the southeastern end of the Carpinteria Valley, in southeastern Santa Barbara County. The Carpinteria Valley is bounded to the east, north and northwest by the foothills of the Santa Ynez Mountains and to the south and west by the Pacific Ocean. The peaks and ridges of the adjacent foothills bounding the Carpinteria Valley range from approximately 600 to 2,000 feet above mean sea level (MSL).

The approximate limits of the study area are shown on Figure 1 of this report. The coordinates for the middle of the site are: Latitude = 34.381°, Longitude = -119.483°.

5.1 Climate

The City of Carpinteria is situated along the only south-facing stretch of coastline in Southern California. Like much of coastal California, the climate is considered Mediterranean and is characterized by mild, wet winters and dry and/or very warm summers. Average high temperatures range from 65° during December and January to 76° during August. Regions with a Mediterranean climate receive almost all of their precipitation during the winter season. The rainy season generally extends from November through March or April, with the bulk of the average rainfall occurring from December to February.

5.2 Existing Topography along Proposed Trail Alignment

The project alignment is located largely in an area of coastal bluff east of the City of Carpinteria near the Santa Barbara/Ventura county line. Below the Carpinteria terrace surface, which is at an elevation of approximately two hundred feet (200') above mean sea level, a series of lower terraces interspersed with relatively steep slopes along the proposed trail route are evidence of extensive past grading to construct both Highway 101 and the Union Pacific Railroad within the project limits. The Union Pacific Railroad right-of-way corridor passes through the proposed trail alignment near its mid-point.

At the eastern end of Carpinteria Avenue, and near the beginning of the proposed trail (~Sta 10+00 to 12+00), the trail alignment is situated atop the slightly modified, through relatively minor fill placement, Carpinteria terrace surface. From ~Sta 12+00 ahead on line to ~Sta 23+00, the proposed trail will traverse a northeast-facing related cut slope constructed when the existing coast highway was realigned, reprofiled (much lower), and widened during the late 1960's to grade the Highway 101 corridor. The 1968 record drawings for the freeway realignment (Contract 05-033024) indicate that this cut slope, above the mid-slope bench, was initially graded at 1:1 h:v (45°), while the lower portion was graded at 1.5:1 (34°). The freeway was later modified, mostly by widening toward the median, in the "Mussel Shoals HOV" Project (Contract No. 07-260704; drawings are dated 2011).

After traversing the above-referenced highway cut slope and reaching a relatively flat shoulder area adjacent to Highway 101, at approximately Sta 23+50, the trail alignment turns slightly southward to span over the UPRR railroad corridor cut via a one hundred and sixty foot (160') long, pre-fabricated pedestrian bridge. In the vicinity of the proposed pedestrian bridge, the railroad cut slope on the northeast side of the tracks has an average gradient of about 1:1 h:v (45°), while the cut slope on the opposite side of the railroad corridor has an average gradient of about 1.5:1 h:v (34°). Two relatively flat bench areas are present on the north side of the railroad cut, with the lower bench having been paved with concrete. These benches drain under the railroad via drainage systems built in the 1968 project.

On the southwest side of the proposed pedestrian bridge, the trail continues onto the ocean bluff or "bluff" portion of the trail alignment. At ~Sta 26+50 the trail alignment will curve to the southeast and head downhill along a the face of an existing, sixty to one hundred-foot (60'-100') high, 1:1 to 1:¾ h:v (45°-60°) southwest (or ocean) facing cut slope that was graded for the original railroad alignment. An existing mid-slope bench serves as an existing, "unmarked" trail, as it's referred to by the Santa Barbara County Parks Dept. The proposed trail will continue downslope until it merges with the existing mid-slope bench at or near Station 35+50. It then transverses along the existing bench and ends at or near the existing parking lot at ~Sta 37+50.

Slopes below the mid-slope bench along the "bluff" portion of the alignment descend to the beach below at average gradient of 1:1 to 1.5:1 h:v (34°-45°).

6.0 SITE INVESTIGATION

6.1 Air Photo Review

The following historical air photos were reviewed at the Map and Imagery Laboratory of Davidson Library, University of California at Santa Barbara.

Photo Series	Date Flown	Scale	Photograph Numbers
C-430	1929	1:24,000	A-21, 22
C-4950	1938	1:24,000	SF-145, 146
GS-EM	8-21-1947	1:24,000	6-150, 6-151
BTM-1954	6-1-1954	1:20,000	11K-90, 91
HA-AN	5-27-1956	1:9,600	6-21, 22
HA-GN	11-23-1959	1:15,600	101, 100
BTM-1961	7-5-1961	1:20,000	7BB-113, -112
HA-VX	2-10-1964	1:12,000	53, 54
HB-QD	10-30-1969	1:12,000	64, 63
HB-SY	12-27-1971	1:6,000	64-67
HB-WL	8-23-1973	1:12,000	3, 4
HB-XQ	2-23-1975	1:12,000	134, 135
USDA-24-615070	1978	1:24,000	678-175
PW-55010	1-17-1995	1:12,000	3, 2

The Carpinteria fault is readily apparent in the early photo series (C-430 and C-4950) where a north-facing scarp and related sag or depression are apparent, unaffected by later grading in the area.

The famous "Thunderbowl" racetrack is first visible in the GS-EM photo series. Per Campos et al (2007), the track operated from the mid-1940's into the 1960's. The track appears to have been constructed within the sag, or depression, at the base of a north-facing scarp, or slope, formed by movement along the Carpinteria fault. It appears that relatively limited grading was required to construct the track, and the fault trace and sag areas are still visible south and southeast of the racetrack. Highway 101 came to Carpinteria in the 1960's, and dirt from various highway excavations ultimately filled the depression and the racetrack. Terratech (1996) indicates that the track was filled between 1969 and 1970.

A complex of small buildings (origin unknown), near the southeast edge of the modern day bluff top and cul-de-sac terminus of Carpinteria Avenue, were apparent in the HA-AN photo series.

The 1971 photo series (HB-SY) reveals slope instability, erosion, etc. to the slope below the old railroad tracks/bench trail, in the vicinity of test trenches TT 07 to TT 09 (Geologic Map, Plate A). This is a drainage corridor with an existing box culvert at the bench, i.e. trail, grade.

Grading for the existing Highway 101 alignment and corridor, which includes the existing Caltrans cut and the railroad cut, was well underway in the HB-QD (1969) photo series. By this time the "Thunderbowl" racetrack and the sag area to the southeast had been filled in. This earth work was part of the eight-mile-long Rincon Freeway project. This project was dedicated on Dec. 21, 1972.

The HB-WL photo series show a number of relatively small, surficial slope failures in the slope below the old railroad tracks/bench trail, in the vicinity of test trench TT 07 and boring DH 07 (Geologic Map, Plate A). Also shown is the construction of the western parking lot at Rincon County Beach Park. The existing path, providing beach access from the western beach park parking lot, has been graded and constructed at this time.

6.2 Summary of Previous Studies (Others)

The City of Carpinteria provided Bengal with copies of two (2) geotechnical documents or reports that were located by City staff, at the request of Bengal. Both reports, TerraTech (1996) and Dudek (2012), reference several reports of previous studies conducted within or immediately adjacent to the project limits. Most, if not all, of these studies were performed to evaluate site geologic conditions as they pertain to proposed development of the site known as "Carpinteria Bluffs Area III". This site is believed to be the vacant, bluff-top parcel(s) located immediately west/northwest of the northern portion of the proposed trail.

The 1996 report by TerraTech contains information that is particularly useful. In addition to reviewing previous site reports, TerraTech reviewed aerial photographs, mapped exposures on slopes, and excavated a ~150' long and up to thirty foot (30') deep seismic trench. The report copy on file at the City lacks maps and other attachments. Of note to the current investigation are the following details:

- TerraTech concluded that three faults crossed the property and concluded that these faults are "potentially active", given the offset of the contact between the Monterey Formation and the overlying terrace deposits.

- TerraTech addressed the issue of landsliding by reviewing the work done by previous investigators. Evidence of large-scale, deep-seated landsliding was observed, though the size and limits of the landsliding was disputed. We have noted and mapped this landslide(s), and it is located northwest and beyond the limits of the proposed trail improvements.

6.3 Summary of Bengal's 2013 Geotechnical Investigation

Site exploration for the preliminary investigation was conducted from April 23-25, 2013. The field investigation consisted of geologic mapping within the project limits and subsurface investigation. Along the existing, unofficial County trail, nine (9) backhoe test trenches were excavated to depths ranging from six feet (6') to thirteen and a half feet (13.5') below grade. Additionally, fourteen (14) hand-dug test pits were excavated within the proposed trail alignment. For reference, the locations of the exploratory test trenches and test pits are shown on the Geologic Maps, Plates A and B (Appendix A).

Subsurface conditions encountered in these explorations were logged by an Engineering Geologist from this office. The subsurface conditions encountered in these test pits and trenches are described in the boring logs included in Appendix B. Representative samples of the earth materials encountered were obtained. Explorations were backfilled with the excavated materials. However, the backfill was not compacted to relative compactions necessary to characterize as engineered compacted fill and, thus, should be monitored for future settlement and/or, if necessary, removed/replaced as compacted engineered-fill.

Within the hand-dug test pits and test trenches, a hand-held sampler (with a sliding drop weight) was used to obtain relatively undisturbed ring samples for laboratory samples. The rings are of 2½" outside and 2.42” inside diameters, and 1" in height.

6.4 Field Investigation – Detailed Design Phase

Site exploration for the detailed design phase was conducted from March 12th-14th and August 16th and 17th, 2018. The detailed design phase field investigation consisted of additional geologic mapping and subsurface investigation. Nine (9) twenty-four inch (24”) diameter borings, ranging from sixteen feet (16’) to fifty-five feet (55’) below grade, and nine (9) hand-dug test pits were drilled/dug, sampled and downhole logged. For reference, the locations of the exploratory borings (designated as DH 01 to DH 08) and test pits (TP 15 to TP 24) are shown on the Geologic Maps, Plates A and B (Appendix A).

Subsurface conditions encountered in these explorations were logged by an Engineering Geologist from this office. The subsurface conditions encountered in these borings and test pits are described in the boring logs included in Appendix B. Representative samples of the earth materials encountered were obtained. With the exception of borings DH 07a and DH 07b, which were backfilled with 2-sack concrete slurry, the borings and test pits were backfilled with the excavated materials. However, the backfill was not compacted to relative compactions generally necessary to characterize as engineered compacted fill and, thus, should be monitored for future settlement and/or, if necessary, removed/replaced as compacted fill to sufficient depths.

Undisturbed samples were obtained within the large-diameter borings with a Modified California (M.C.) ring sampler (ASTM D 3550 with a shoe similar to ASTM D 1586). The M.C. sampler has a 3" outside diameter and a 2.5" inside diameter. Samples were obtained by driving the sampler with successive drops of the Kelly bar. The soil is retained in the brass rings of 2½" outside diameter, 2.42” inside diameter and 1" in height.

Within the hand-dug test pits, a hand ring sampler (with a sliding drop weight) was used to obtain relatively undisturbed ring samples (2½" outside and 2.42” inside diameter and 1" in height) for laboratory testing.

Bulk samples were also obtained for testing and analysis. All undisturbed and bulk samples were sent to the laboratory for examination, testing, and classification, using the Unified Classification system and group symbol.

6.5 Laboratory Testing

Several laboratory tests were assigned on representative samples of the subsurface materials obtained from the exploratory test pits, trenches, and borings. These tests included:

- Moisture-Density tests
- Sieve Analysis tests
- Atterberg Limits tests
- Direct Shear tests
- Unconfined Compression (UC) tests
- R-Value testing, and
- Soil Corrosion tests

SubSurface Designs, Inc., of Sylmar, California and AP Engineering and Testing, Inc., of Pomona, California, performed the laboratory testing on the selected samples assigned by Bengal Engineering. Test results are included in Appendix C.

These tests were conducted to aid in the classification of the subsurface materials and to determine their shear strength parameters for slope stability analysis. These tests were conducted in accordance with the general procedure included in the applicable ASTM standards.

7.0 GEOLOGIC CONDITIONS

7.1 Regional Geology

The project site is located within the Western Transverse Ranges physiographic province of Southern California. The Transverse Ranges are a complex series of east-west trending mountain ranges and valleys. Mountain ranges in the Transverse Ranges province are made up of rocks that are progressively older from the west to the east. The structural orientation of this province is transverse to the general north-northwest structural trend of the other geologic provinces in California. The Western Transverse Ranges extends from the Ventura County, west to Point Arguello, and is dominated by the east-west trending Santa Ynez Mountain Range. Cretaceous-Cenozoic sedimentary marine rocks and Miocene volcanic rocks dominate the Western Transverse Ranges region.

Structurally, the Carpinteria Valley and the project site are within an area termed the Santa Barbara Fold Belt (Gurrola. et al., 1998). The Santa Barbara Fold Belt is located along the coastal piedmont (the area between the mountains and the ocean) from east of Carpinteria to west of Goleta. It is a region of active folding that is generally comprised of west to northwest trending folds and blind reverse faults deforming late Pleistocene (11,000 to 1.6 million years before present) to Holocene (11,000 years to present) marine terraces, terrace deposits, and alluvial fans (Gurrola et al., 1998). This deformation is thought to have caused localized topographic highs within the Carpinteria Valley, such as the Shepard Mesa and Summerland Hills.

The project area is located at the western end of an area termed by Dibblee (1994) as the Rincon Uplift. A block of marine, Miocene shale formations has been uplifted between the Red Mountain Fault on the south and the Rincon Creek Fault on the north. This uplifted block, which is anywhere from one to two miles wide, becomes gradually and progressively higher to the east, from Carpinteria to its high point at Rincon Mountain.

7.2 Overview of Topography and Site Geology along Proposed Trail Alignment

At the eastern end of Carpinteria Avenue and near the beginning of the proposed trail (~Sta 10+00 to 12+00), the project is situated atop the slightly modified eastern end of the Carpinteria coastal bluffs. The bluffs are eroded from complexly folded Monterey Shale and overlain by a thin, relatively flat-lying deposit of sandy, older alluvium and, adjacent to the contact with the underlying bedrock, regressive marine sand deposits. Mapping by the CGS (2003) and others suggests these marine terrace sands may be correlative with the dated (40-60kya) Punta Gorda terrace, located between the project limits and Ventura to the east/southeast.

Relatively thin amounts of earth fill have been placed atop the terrace deposits atop the Carpinteria coastal bluff. Approximately six feet (6') of fill overlaying terrace deposits, was encountered in test pit TP 01, and two feet (2') of fill was identified in boring DH 08.

As previously mentioned, east of the Carpinteria Avenue cul-de-sac, a north-facing scarp and related sag (depressed area) are visible in early aerial photos and topographic maps. The scarp/sag appear to the features associated with the potentially active Carpinteria Fault. The filling and leveling of this area appears to have occurred during the 1960's, in conjunction with the construction of nearby Highway 101.

From ~Sta 12+00 ahead on line to ~Sta 23+00, the proposed trail traverses a northeast-facing cut slope constructed when the existing roadway was realigned and widened during the late 1960's and early 1970's to create the 6-lane Highway 101. The northern portion of this cut slope is underlain by both terrace deposits and Santa Barbara Formation, as shown on the Geologic Map (Plate A, Appendix A). Relatively shallow surficial failures were observed and mapped within the terrace deposits on this cut slope, exclusively within the portion of the cut slope graded at 1:1 h:v (45°).

Near Sta 18+00, a high angle, south-dipping fault (presumably the Carpinteria Fault) brings siliceous shale of the Monterey Formation (Tm) into contact with both the Santa Barbara Formation and marine terrace sands. The fault contact was observed within Test Pits TP 04 and TP 08 (Plate A, Appendix A). To the southeast of this fault contact, thinly-bedded Monterey shale is exposed along the proposed trail alignment and on the Highway 101 cut slope. Where observed, bedding within the Monterey dips steeply south and locally north, where it is overturned. While relatively hard, the shale is closely fractured, locally jointed and weathers to a slopewash which is soft and prone to erosion and creep on the relatively steep cut slope.

After traversing the Highway 101 cut slope, the proposed trail will curve southward before crossing the UPRR tracks on a 160-foot long pre-fabricated pedestrian bridge. Aerial photo research indicates that the UPRR cut was made at the same time the Highway 101 construction was occurring, i.e. the late 1960's and into the early 1970's. At the proposed location of the northern abutment of the proposed pedestrian bridge, an analysis of the record drawings for the referenced railroad project indicates that the existing grade is approximately one hundred feet (100') lower than the original, pre-Highway 101 grade. Near-vertical beds of moderately hard

to very hard bedrock (siliceous siltstone) were mapped within borings DH 07a and DH 07b, drilled adjacent to the northern abutment of the proposed pedestrian bridge. Steeply south-dipping to overturned, locally folded and contorted, Monterey Shale is well-exposed in the railroad cut. Overall, the railroad cut slopes near the proposed pedestrian bridge location have performed relatively well, though the moderately hard, but brittle and fractured siliceous shale is prone to sloughing, and talus mantles the lower portions of the cut slopes in several areas.

On the southwest side of the proposed pedestrian bridge, the proposed trail is in cut as it crosses over a relatively sharp, northwest-trending ridgeline. An overlook is proposed at this location, approximately Sta 26+50, where trail users can rest while enjoying a panoramic and sweeping view of the Pacific Ocean. Here also the trail alignment veers southeast and descends the relatively steep (45°-±60°) southwest-facing cut slope constructed along the original railroad alignment through this area. From ~ Sta 26+50 to ~Sta 33+00 the cut slope is composed of steeply north-dipping and fractured shales of the Monterey Formation. The existing cut slope is in overall fair condition, with an area of exception being the previous slope failures and current failure scar from ~ Sta 27+50 to ~ Sta 28+75. A wedge of mixed slopewash and shallow rock fall debris was observed and encountered in test trenches TT 04 to TT 06.

Cut and fill grading is proposed as the trail will traverse and descend the cut slope at ~5% profile grade. Cut slopes are proposed at a 1:1 (45°) gradient, along with drainage measures along the top of the cut and mid-slope bench, while a 1.25:1 (h:v) geotextile-reinforced fill slope will daylight along the existing mid-slope bench or the “unmarked” trail as its referred to by the Santa Barbara County Parks Dept. Test pits and borings indicate that much of the slope below the mid-slope bench was constructed as a sliver fill embankment during grading for the original railroad alignment.

The trail alignment will cross the conformable contact between the Monterey and younger Sisquoc Formations (Tsq) at ~ Sta 33+00. Compared to the Monterey, the Sisquoc is not as well-bedded and is composed primarily of mudstone and/or siltstone that lacks the hard, siliceous intervals. Where observed in site explorations and at outcrop, bedding within the Sisquoc strikes generally east-west and dips steeply to the north. Near its contact with the Monterey Formation, slope failures have been investigated and mapped in the Sisquoc portion of the cut slope between ~Sta 33+40 and ~Sta 35+00.

After traversing the existing bluff cut slope face, the proposed trail will intersect the existing mid-slope bench at approximately Sta 36+00. From this point ahead to the end of the trail alignment and intersection with the Rincon Beach parking lot, the trail will be in a slight cut. From ~Sta 36+50 ahead, the existing cut slope above the bench/trail is comprised of terrace deposits (Qt), unconsolidated sands with occasional cobbles and small boulders which are locally weakly cemented and mantled by a relatively thick soil profile. Given their lower elevation, these terrace deposits appear to be younger than those along the top of the Carpinteria bluffs.

7.3 Faulting and Seismicity

The site is located in an active seismic region where large numbers of earthquakes occur each year. Moderate to large earthquakes, capable of generating significant ground motions at the subject site, have occurred in the region and are likely to occur again during the design life of the subject facility.

The Rincon Creek and Carpinteria faults, and the "central fault" discussed by Putnam (1942), are three south-dipping reverse faults, within and adjacent to the project limits, which bound the north side of the Rincon Mountain horst structure.

Carpinteria Fault

The Carpinteria fault, a high-angle, south-dipping reverse fault, has been mapped as trending north of west through the project limits. Dibblee (1994) mentions that the fault once formed a “low, vague, north-facing scarp in older alluvium just south of Highway 101” and immediately east of the project limits. The north-facing scarp was seen on early aerial photos and early USGS topographic maps, prior to development of the aforementioned “Thunderbowl” racetrack and subsequent placement of fill generated by the nearby grading of Highway 101. The fault is thought to possibly merge with the Rincon Creek Fault further to the west.

Bengal believes it exposed the Carpinteria Fault in test pits TP 04 and TP 08, and mapped the approximate surface trace of the fault on the Geologic Map (Plate A). The fault has displaced the 40k to 60k Punta Gorda marine terrace deposits (Qtm). Test Pit TP 04 showed clear evidence of the Monterey Formation bedrock in fault contact with sandy, unconsolidated Qtm deposits along a near-vertical fault plane parallel to bedding within the Monterey. Guptill (1981) mentioned that the total vertical separation of the bedrock wave abrasion platform measures thirty feet (30') at this location.

Guptill (1981) also described work to confirm the location of the Carpinteria fault west of the Highway 101 road cut. Bucket auger holes demonstrated about eighteen feet (18') of vertical separation of the terrace bench, and an antithetic fault south of the main trace offset the terrace contact and near-surface soils in a backhoe trench, which would appear to indicate quite youthful activity.

Rincon Creek Fault

The potentially active Rincon Creek fault (aka Rincon Creek / Mesa fault) and associated Rincon Creek Anticline are located approximately 3,500 feet and 1,800 feet north, respectively, of the northern limits of the study area. The fault is thought to be capable of a moment magnitude 6.4 to 6.6 earthquake. The fault is a reverse, south-side up that is thought to join the Mesa Fault west of Carpinteria. The Mesa fault is considered “active” by Santa Barbara County (1979), and it may be responsible for any of several notable earthquakes in the Santa Barbara area since records have been kept.

Red Mountain Fault

The steeply dipping / overturned block of Monterey and Sisquoc Formations is elevated on the Red Mountain fault, located just offshore, against the Pliocene Pico Formation to the south (Dibblee, 1994). The Red Mountain fault, a thrust fault capable of earthquakes between M_w 6.0-6.8 (SCEC) to 7.2 (Caltrans), is thought to dip steeply north in the project vicinity and strike south of east under Rincon Point and onshore about one mile east of Rincon Point. The fault splays into two main branches near the Carpinteria coast. The State of California considers the Red Mountain fault to be “active”, as evidence has been found at location(s) along the surface fault trace for ground rupture during the Holocene (i.e. the last 11,000 years).

The location of the Red Mountain fault varies depending on the source of the geologic mapping. Some workers show the queried or approximate location of the fault trending through Rincon Point (Dibblee, 1994), where an exposure of Pico Formation bedrock has been mapped, or offshore of Rincon Point (California Geological Survey, 2003).

7.4 Earth Materials

Areas of earth fill (ef) are found throughout the project limits. The areas of earth fill shown on the attached Geologic Maps (Plates A and B) are what are considered to be significant in the sense that they are large and/or relatively thick, or the fill has been placed to help minimize erosion of other slope stability issues, or that the fill is located in areas that will be subject to bluff-retreat processes. Notable areas of fill include:

- The fill placed on the bluff top, at and near the start of the proposed trail. Approximately two to six feet (2'-6') was encountered in subsurface explorations in this area.
- Fill encountered in numerous test pits excavated at the base of the bluff, above the aerial extent of the beach sands and encountered in several borings excavated along the outside edge of the mid-slope bench. It appears this fill was placed or cast in order to widen the mid-slope bench (on which the railroad ran along for several decades) and to slow the natural bluff retreat process. Along the base of the coastal bluff, the fill was placed directly atop beach sands.

With the exception of the soil profile observed near the County Park parking lot, natural soil deposits (Qns) were not encountered within the explorations, as much of the trail corridor has been extensively graded. Slopewash (Qsw) was noted in several test trenches excavated just above the existing unsanctioned County trail, at the base of this over-steepened slope, and mantling the Highway 101 cut slope. Landslide debris (Qls), both definitive and questionable, is shown on the Geologic Maps and was observed in many explorations along the ocean portion of the proposed trail alignment. Colluvium (Qc), a term for a heterogeneous mix of materials present on a slope, was mapped in several areas and observed in a few explorations. Though not mapped as a separate unit, shale rock fragments (i.e. talus) have accumulated near the base of slopes within the railroad cut. A relatively thin and transient deposit of beach sand (Qbs) mantles the modern bedrock abrasion platform along the beach.

Terrace deposits (Qt) have been mapped in the existing cut slope near the end of the proposed trail alignment. Older marine terrace deposits (Qtm), which have been mapped and correlated by others with the 40-60 kya Punta Gorda terrace, cover or veneer much of the relatively flat Carpinteria bluff area and were observed and sampled in several test pits.

From north to south across the project limits, sedimentary bedrock of the Santa Barbara Formation (Qsb), the Monterey Formation (Tm), and the Sisqouc Formation (Tsq) underlie the unconsolidated deposits.

The earth materials encountered within the explorations and exposed at the surface within the project limits are briefly described below. For approximate depths and more detailed descriptions, refer to the enclosed Logs of Subsurface Explorations (see Appendix B). The surficial distribution of geologic materials is shown on the Geologic Maps (Appendix A).

Earth Fill (ef)

In TP 01 and boring DH 08, near the northwest end of the project limits, the fill varied from yellowish brown, very dense silty gravel (GM) to dark brown silty sand (SM) to light brown fine-grained silty sand / sandy silt (ML) with scattered rock fragments. At the southeast end of the project limits, the earth fill encountered within explorations along the former railroad alignment consists of silt with some sand (ML) to fine-grained silty sand / sandy silt (SM/ML) with scattered to abundant shale fragments which is light brown to brown to light yellowish brown to light brownish gray, soft/loose to compact, and slightly moist with scattered roots and an occasional piece of construction debris.

Beach Sand (Qbs)

The beach area is mantled by a relatively thin layer of fine- to medium-grained sand (SP) with scattered cobbles which is light brown to tan, loose to medium dense, and dry to moist.

The thickness of the beach sand deposits varies considerably during the course of the year, with winter storm and wave conditions creating a thin profile of sand, as compared to the summer months.

Slopewash (Qsw)

Slopewash was observed in several test pits excavated along the base of the Highway 101 cut slope, above the southbound 101 on-ramp. The slopewash mantles the cut slope where the bedrock isn't exposed, is material derived from the bedrock, and is subject to slope processes such as creep and erosion. Where observed in the test pits in this area, the slopewash consists of light brown sandy silt (ML) with scattered rock fragments which is soft/loose to slightly dense, slightly moist and contains scattered to abundant roots.

Slopewash was also noted in several test trenches excavated along the base of the over-steepened slope above the existing, "unsanctioned" Santa Barbara County trail, i.e. the old railroad bed. These deposits accumulated at the base of the slope over time and vary from being clast- to matrix-supported and are noted for being quite loose and prone to caving/collapse.

Landslide Debris (Qls)

Landslide debris and questionable landslide debris / landslide-affected rock has been mapped in several areas within and adjacent to the proposed trail alignment. Where observed, the landslide debris consists of a heterogeneous, massive, clast- to matrix-supported mix of mudstone fragments in a matrix of light brown elastic silt to sandy silt to silt with clay (ML).

Questionable landslide-affected bedrock was encountered in boring DH 04, to a depth of seventeen feet (17') below grade, and consists of a highly fractured, dry, slightly hard mudstone and siltstone with local open fractures and discontinuous structure.

Terrace Deposits (Qt)

Where observed, these deposits consist mainly of medium- to thick-bedded, fine- to medium-grained sand (SP), occasionally laminated, with occasional gravel to gravelly sand (GP) with occasional layers with cobbles to small boulders which is brown grading light yellow to light reddish brown (with depth), slightly moist, and dense to very dense with localized areas of cementation.

Marine Terrace Deposits (Qtm)

Where observed, these deposits consist mainly of light reddish brown / light orange brown, brown to reddish tan clean, fine- to medium-grained sand (SP) with some silt, with occasional gravel. Near the Qtm/bedrock contact in boring DH 08 the generally thick-bedded to massive sands became coarser-grained with abundant cobbles.

These deposits unconformably overlie eroded bedrock on an elevated marine wave-cut platform. In some locations the basal layer consists of cobble to pebble gravel or conglomerate grading upward into laminated, massive beach sand. The upper two-thirds or more of terrace sequences typically includes non-marine, stratified fluvial and alluvial pebble-cobble gravel with fines and minor colluvial deposits.

The earth fill, beach sand, slopewash, colluvium, landslide debris, terrace and marine terrace deposits were classified visually and, where available, using results of the laboratory tests in accordance with the Unified Soils Classification System.

Bedrock (Qsb) – Santa Barbara Formation (lower Pleistocene)

The Santa Barbara Formation, consisting of fossiliferous fine-grained sandstone and siltstone, crops out along the base of the southbound Highway 101 cut slope and was observed/sampled in test pits TP 07 and TP 08. Where observed in the test pits and on the cut slope, the bedrock is typically buff to pale-yellow (where weathered), soft to moderately hard, friable, moist, consolidated and weakly to locally well-indurated (i.e. cemented). Abundant fossils, most of which are broken into a “hash”, include pectin and turritella.

Bedrock (Tsq) – Sisquoc Formation (Pliocene-Miocene)

The Sisquoc Formation generally consists of occasionally bedded to massive mudstone, siltstone and diatomaceous mudstone. The bedrock is typically light brown to light yellowish brown to olive/brownish gray grading to gray/blue-gray (unoxidized), moderately hard to hard, moist, moderately to slightly weathered, highly to slightly fractured, and occasionally jointed. The Sisquoc is generally considered a “landslide prone” formation.

Bedrock (Tm) – Monterey Formation (Miocene)

Thinly-bedded, soft to moderately hard shale, laminated siltstone, diatomaceous shale and very hard siliceous shale, with minor beds of chert, of the Miocene Monterey Formation underlies most of the project area and is exposed along the sea cliffs, within the railroad cut, and along the highway cut above the southbound Highway 101 on-ramp. The bedrock is typically gray to grayish brown to light brown to dark gray/black, slightly hard to very hard, slightly weathered, and highly to slightly fractured.

Earth material profiles can only be obtained from individual explorations placed on the subject property. Care should be exercised when using these profiles to determine changes in depth or thickness of the earth materials between explorations.

7.5 Geologic Structure

Geologic structure refers to the presence and preferred orientation of geologic features or discontinuities within the bedrock materials; such as bedding, shearing, jointing, flow banding, fracturing, etc.

Within the study limits, the Tertiary bedrock formations (Sisquoc and Monterey) have been thrust up and brought into contact with the Santa Barbara formation along the Carpinteria Fault. South of the fault, the Monterey and Sisquoc shales are together upended and partly overturned southward. In other words, north-dipping bedding is overturned. Along the beach, the Monterey is complexly folded, is generally upended or overturned, and contains numerous tar seeps.

Site sedimentary bedrock exhibits continuous and planar bedding (planar or nearly planar surfaces that visibly separate each successive layer of stratified rock). Bedding mapped in the explorations, and where bedrock is exposed at the surface, exhibits a consistent east-west strike with primarily steep dips both north and south.

7.6 Landslides

Areas of landslide debris and questionable landslide debris have been mapped (Geologic Maps, Appendix A) along the proposed trail corridor, primarily along the existing unsanctioned County trail along the present sea cliff.

Along the Caltrans cut slope, in the vicinity of Sta 16+00 to 17+00, surficial failures have occurred within the marine terrace deposits (Qtm) located above the mid-slope bench. Of note is that these failures occurred in the highest and steepest, 1:1 (h:v) portions of the cut slope where the terrace sands are exposed.

Between approximately Sta 33+40 and Sta 35+00, coalescing landslides have been mapped along the proposed trail alignment. Further evidence of slope instability includes segments of a top-of-slope retaining wall, originally constructed to support a portion of the original coast highway prior to realignment, which are now lying on the slope below. Test trenches TT 02 and TT 03 were excavated in these landslide deposits, near the base of the ascending slope. Eight feet (8') of landslide debris was encountered in TT 02, and eleven feet (11') in TT 03. These slides developed in weathered and over-steepened cut slopes of Sisquoc Formation mud/siltstone.

During the detailed design exploration phase this area was further investigated. Boring DH 04 was drilled, sampled and downhole logged to thirty-five feet (35') below grade. Questionable landslide-affected bedrock and/or poor-quality rock, characterized by open fractures, discontinuous structure and local "powdery" zones, was encountered to a depth of seventeen feet (17') below grade. A distinct shear or shear zone was not observed at 17', but rather a steeply northwest- to west-dipping fracture zone with open voids and roots below which the rock quality immediately improved.

The area between approximately Sta 33+40 to Sta 35+00, including the existing cut slope areas and the existing bench on which compacted fill will be placed, will require mitigation as part of the construction of the proposed trail. The existing, ascending slopes in this area are not stable and, unless mitigated, this is a likely area for future movement and/or distress. We recommend remedial grading of this area by way of construction of a buttress fill.

Additional areas of landslide-affected or potential landslide-affected materials have been mapped along the ocean bluff and have the potential to impact construction and long-term performance of the proposed trail (Geologic Maps, Appendix A).

1) Southwest of Sta 27+00, approximately twelve feet (12') of colluvium or landslide debris was encountered in boring DH 01, and similar colluvium and/or mudflow deposits were encountered in test pit TP 24, excavated near the toe of slope and above the beach sands. A massive and heterogeneous mix of shale fragments and light brown to light orange brown silt/clayey silt are exposed in a near-vertical slope face along the base of the bluff. In test pit TP 24, beach deposits were found at a depth of nine feet (9').

   The colluvium/mud flow deposits observed on the slope and in test pit TP 24 appear to thicken toward the northwest, where they are well-exposed in the steep slope just behind a low-height concrete sea wall.

2) Highly fractured and locally contorted and thermally altered shale is exposed in the scar of coalescing, relatively shallow landslides on the existing cut slope between ~ Sta 27+50 to ~ Sta 28+75. The proposed 1:1 (h:v) cut slope should help mitigate the potential for future shallow sliding/rock fall events. Trail construction below the trail surface and the descending fill slope will require close construction monitoring to ensure that all loose debris had been removed prior to the placement of compacted fill in keyway(s) and atop cut benches.

3) Underlying fill along the beach and at the toe of the sliver fill slope, three feet (3') of landslide debris overlying beach sand was encountered in test pit TP 21. Given the location, this failure is analogous to the common type of slope failure seen as a result of wave-attack at the base of the sea cliff. It is likely that additional areas of landslide debris are found along the base of the sea cliff within the project limits.

   Relatively recent tension cracks, indicative of an incipient shallow (?) failure developed in colluvium and/or landslide debris, have developed near the top of the descending slope in the vicinity of Sta 35+50 (Geologic Map, Plate B).

4) The fill materials comprising the afore-mentioned sliver fill slope below the County trail and mid-slope bench are, in general, prone to surficial erosion and occasional shallow slope failures.

Air photo analysis and field mapping indicate the presence of a relatively large and deep-seated landslide present within the coastal bluff slope, west of the project limits. Guptill (1981) mentioned that this landslide moved slightly during the 1978-79 winter rains, with open fissures, offset culverts and a pronounced sag along a portion of the railroad tracks observed. Subsurface exploration at a point just north of the railroad tracks indicated a suspected slide zone located approximately forty to fifty feet (40'-50') below grade (Guptill, 1981).

7.7 Sea-Cliff or Bluff Retreat Rates

Long term rates of cliff or bluff erosion along the "South Coast" region, which includes the Carpinteria area, have been calculated by many and this remains an area of active research. This includes site-specific, and regional, studies, including a 2007 study by the United States Geological Survey (USGS), which quantitatively assessed bluff retreat rates along the entire California coastline.

The coastal portion of the proposed trail will be affected by the various processes of sea-cliff retreat. Evidence for this can clearly be seen in the landslide and/or debris/mud flow deposits mapped along the sea-cliff (Geologic Maps, Appendix A) and areas of surficial erosion that have required remedial measures in an attempt to stop or slow down the bluff retreat process. These measures include the past construction of two seawall segments at the base of the bluff, and the placement of concrete rubble fill. The seawall protection is for the bluffs located northwest and outside the project limits.

The City of Carpinteria's General Plan (2003) suggests for planning purposes the use of a "conservative" rate of an average long-term, bluff retreat of 6.0 inches/year.

8.0 GEOTECHNICAL CONDITIONS AND RECOMMENDATIONS

This section presents our review of the pertinent geotechnical conditions along the proposed trail alignment. The existing surface grade and the proposed finish grade elevations along the centerline of the proposed trail alignment, the proposed cut/fill details and recommended remedial/stabilization excavation/backfill limits are shown on Plates A through D (Appendix A) and the Typical Cross Section and Layout Plans (Appendix E).

8.1 Subsurface Soil/Bedrock Conditions

Based on the review of existing relevant information and the results of field exploration and laboratory testing conducted as part of this study, subsurface materials underlying the project site can be divided into seven (7) broad units for the purpose of geotechnical analysis and design. These units include:

1. Artificial fill consisting of mainly dry to moist, loose to medium dense silty sand (SM) and elastic silt/sandy silt (MH).
2. Marine Terrace Deposits (Qtm) consisting mainly of fine- to medium-grained sand (SP) and silt (ML) layers with interbedded layers of silty/clayey sand (SM/SC) and gravelly sand (GP).
3. Santa Barbara Formation (Qsb) consisting of locally well-cemented dense to very dense sand and silty sand soil-like bedrock materials.
4. Monterey Formation (Tm) – slightly to moderately hard, well-bedded, moderately weathered sandy silt/silt-like (MH) siliceous shale and shale bedrock.

5. Sisquoc Formation (Tsq) consisting of mainly slightly to moderately hard, highly fractured and moderately weathered elastic silt-like (MH) siltstone/mudstone bedrock.
6. Slopewash/colluvium/landslide debris (Qsw/Qc/Qls) consisting of mainly loose, sandy silt with little or no clay (MH) and rock fragments, and silty sand (SM), and
7. Beach Deposit (Qbs) consisting of loose to medium dense sand (SP) with cobbles.

For more detailed description of the subsurface materials, including their area exposure and spatial distributions along the alignment and the bedrock bedding orientations, where present, please refer to the Plates A through D in Appendix A and the exploration logs in Appendix B.

Based on the subsurface materials encountered at the locations of the field explorations, the proposed trail alignment can be broadly divided into five (5) geotechnical segments:

Segment 1: Station 10+00 to Approx. Station 17+70

This segment is located north of the Carpinteria Fault, which intersects the proposed trail alignment at approximately Station 17+70. This segment of the alignment is underlain, at the locations of the field exploration, by about two (2) to six (6) feet of fill soils (ef) consisting of mainly silty sand (SM) to silty gravel (GM). About two (2) feet of slopewash (Qsw) soil was encountered on the north-east (or freeway) side of the trail alignment. Fill or slopewash soils are underlain by up to about thirty (30) feet of Marine Terrance Deposit (Qtm), which consist of dense to very dense sand (SP), which in turn is underlain by moderately hard to hard, cemented, sand (SP) to silty sand (SM) bedrock of the Santa Barbara Formation (Qsb).

Segment 2: Approx. Station 17+70 to Approx. Station 24+00

This segment of the trail alignment is underlain by about one (1) to two (2) feet of fill soils (ef) or slopewash (Qsw) over Monterey Formation (Tm) bedrock consisting of moist to slightly moist, slightly weathered, tightly fractured, well-bedded, and very stiff to moderately hard siliceous shale and shale.

Segment 3: Approx. Station 24+00 to Approx. Station 26+50

This segment of the trail alignment is within the UPRR railroad corridor cut and underlain by moist to slightly moist, moderately to slightly weathered, laminated and well-bedded, stiff to moderately hard to hard Monterey Formation (Tm) bedrock consisting of siliceous shale and shale with little or no overlying overburden soils. This segment of the trail alignment will be carried over the railroad cut by a proposed single-span trail bridge. The proposed pile-supported bridge abutments are located at Stations 24+50 (Abutment 1) and Station 26+10 (Abutment 2). The southern part of this trail segment, past Abutment 2, traverses along the bottom of a proposed cut through the middle of a steeply rising ridge before daylighting on the face of the ocean-facing steep slope or coastal bluff.

Segment 4: Approx. Station 26+50 to Approx. Station 33+00

This portion of the trail alignment traverses across and down the modified, relatively steep cut face of the bluff from its top to an existing, unsanctioned dirt trail located at mid-height of the overall slope. The slope materials beneath the trail consists of mainly moist, stiff to moderately hard, thinly bedded, highly to moderately weathered siliceous siltstone and shale of the Monterey Formation (Tm). The bedrock material (Tm) within the lower part of the slope, below the existing dirt trail, is overlain by up to ten (10) to fifteen (15) feet of mixed earth fill/slopewash/colluvium (ef/Qsw/Qc) materials. A number of localized surficial landslides (Qls) were also mapped on this area of the slope. These surficial materials are considered potentially unstable, compressible under static loads (i.e. new fill), and susceptible to new or reactivated landsliding.

Segment 5: Approx. Station 33+00 to Station 37+50

This segment of the trail alignment is underlain by mainly moist to slightly moist, weathered to slightly weathered, locally jointed, massive to locally bedded, and slightly to moderately hard mudstone/siltstone bedrock of the Sisqouc Formation (Tsq). The lower part of the slope, below the merged segment of the existing dirt trail and the proposed trail alignment, is overlain by about four (4) to seven (7) feet of fill (ef) over two (2) to five (5) feet of colluvium/landslide debris, which in turn is underlain by beach sand near the toe of slope. An approximately one hundred fifty (150) foot wide, minimum ten (10) to twelve (12) foot deep landslide is mapped along this trail segment between approximately Stations 33+20 and 34+70.

8.2 Groundwater Conditions

Groundwater and/or seepage were not encountered within the subsurface explorations. Evidence of surface seeps, i.e. springs, within or adjacent to the project limits was not observed. Additionally we have seen no mention of historical springs within the reviewed documents.

Though groundwater was not encountered, there are two settings where transient groundwater or seepage may occur at various times (dependent mostly on seasonal rainfall): (1) at the interface between the unconsolidated marine terrace deposits and the shale bedrock and (2) at or near the base of the coastal bluff, i.e. behind the beach. These groundwater regimes are noted along many other stretches of coastline along southern Santa Barbara County.

It must be noted that fluctuations in groundwater conditions or levels will occur. The depth to groundwater, if encountered in the explorations, is only valid for the date of exploration. Changes may occur in this groundwater level due to climatic conditions and/or alterations in the existing groundwater recharge area (i.e. surface drainage and surface water infiltration conditions).

8.3 Engineering Parameters for Soil/Bedrock Materials

Laboratory tests were performed to evaluate soil/bedrock parameters necessary for the geotechnical engineering evaluation of the existing and proposed site conditions, and evaluation, design and construction of the proposed improvements. Results of the laboratory testing are included in Appendix C, and results of the direct shear tests are also plotted on Figures 4-1 through 4-22 attached in Appendix A. Design soil parameters, developed based on the interpretation/evaluation of the laboratory test results, are summarized in Table 1 below.

Table 1. Summary of Selected Design Soil/Bedrock Parameters

Soil/Bedrock	In-situ		Atterberg Limits		Peak Shear Strength Parameters	
	Moisture Content (%)	Dry Density (pcf)	Liquid Limit (LL)	Plasticity Index (PI)	Cohesion, c (psf)	Effective Friction Angle, ϕ (degrees)
Earth Fill (ef)	14.0-19.0	74-103	0-37	0-22	300-450	27-28
Terrace Deposit (Qtm)	2.5 - 5.0	102-110	-	-	100-180	28-44
Monterey Formation (Tm)	13.0-38.0	67-107	45-67	5-26	300-1650	26-54
Santa Barbara Formation (Qsb)	11.0-13.0	98-112	NP	NP	300	38
Sisquoc Formation (Tsq)	9.0-18.0	103-108	46-50	1-15	340-800	22-32
Slopewash / Colluvium / Landslide Debris (Qsw/Qc/Qls)	10.0-1.07	92-108	44-56	2-28	0-300(1)	27-38(1)
Beach Deposit (Qbs)	-	106	-	-	0	28

8.4 Seismic Hazards

8.4.1 Primary Seismic Hazards

The project site is located within a seismically active region of Southern California. The general area has experienced moderate to strong ground motions due to earthquakes in the past and is likely to experience similar earthquake-induced ground motions during the design life of the of the proposed improvements.

8.4.1.1 Fault Rupture Hazards

The proposed trail alignment is not located within any currently identified Alquist-Priolo Earthquake Fault Zone (EFZ), as defined by the California Geological Survey (CGS, 2011b).

The Carpinteria fault crosses the alignment at or near Station 17+70, as shown on Plate A (Appendix A). However at this time, neither the California Geological Survey (CGS, 2008) nor the California Department of Transportation (Caltrans, 2012) considers this fault as a source for seismic hazards. Therefore, the potential for fault surface rupture due to movement of the Carpinteria Fault at the site is considered low.

8.4.1.2 Ground Motion Hazards

The general area around the site is underlain by numerous active and potentially active faults, including the Mesa-Rincon Creek fault and the Red Mountain fault. Based on the Caltrans' 2012 fault database (Caltrans, 2012), the Mesa-Rincon Fault is the nearest active fault from the alignment. This reverse fault, located about 0.5 km northeast from the proposed trail bridge location, as shown on Figure 5, is capable of generating a maximum earthquake of moment magnitude, M_{max}= 6.6 . The Red Mountain fault is located about 2.2 km south of the proposed trail bridge. This reverse fault is capable of generating a maximum earthquake of moment magnitude, M_{max}=7.4.

A seismic ground motion hazard analysis was performed using the Caltrans ARS Online (Caltrans, 2018) tool to evaluate design ground motion for the subject trail bridge. The design ground motion, as per Caltrans SDC (Caltrans, 2013), is defined as the envelope of the deterministic ARS and probabilistic ARS based on a return period of 975 years. For ground motion analysis, the soil profile at the site can be categorized as Type C. Therefore, this ground motion hazard analysis was performed based on an average, $(V_s)_{30}$ = 560 m/sec.

The recommended ARS curve and the corresponding data points developed based on the above analysis are presented in Figure 6 (Appendix A). The design ARS from period T=0.05 to 0.40 sec is controlled by the probabilistic hazard. The design PGA≈0.8g and the ARS curve for T>0.40 sec is controlled by the deterministic hazard. The moment magnitude of the design earthquake (M) associated with the design PGA=0.8g is 7.4 (i.e., M=7.4).

8.4.2 Secondary Seismic Hazards

8.4.2.1 Liquefaction

Formation materials present along the trail alignment are not of the type that are susceptible to liquefaction. In the absence of groundwater, soils present along the alignment are not considered liquefiable during earthquakes.

8.4.2.2 Seismic Slope Failure/Lateral Spreading

The design peak ground acceleration, PGA=0.80g, at the site is relatively high. Results of our seismic slope stability analyses are presented in Appendix D and discussed later in this report.

It should be noted that much of the artificial fill, especially fills associated with early 20th century road and railroad construction, may not be properly engineered. Non-engineered surficial existing fills, slopewash, colluvium and landslide debris, particularly those below the existing dirt trail on the ocean-facing bluff slope, are considered prone to lateral/downslope movements during strong seismic events. All new fills proposed as part of the trail construction along this segment of the trail are recommended to be: (1) keyed into competent slope material by removing surficially unsuitable soils, and (b) placed as geotextile-reinforced engineered fill to prevent surficial instability during future earthquakes.

8.4.2.3 Rockfall Potential

Steeper slopes, particularly those on the ocean side, are composed of shales of the Monterey and Sisquoc Formations. These materials are slightly to moderately hard, well-bedded (Monterey) and locally highly fractured. Some rock falls are to be anticipated during seismic events. The potential for this will be of a limited nature and size.

8.4.2.4 Ground Settlement

Ground settlement along the subject trail, if any, during seismic events should be small and of no consequence to the proposed improvements.

8.4.2.5 Tsunami

Hazards due to tsunami-generated flooding exist along the California coastline. Distant and local offshore earthquake faults, and aseismic as well as co-seismic submarine landslides within the Santa Barbara Channel are potential sources of tsunami waves that can reach the Carpinteria coastline.

The California Emergency Management Agency (CalEMA, 2009) has published a map designed as the “Tsunami Inundation Map” that shows the location and limits of the areas along the California coast that are subject to inundation during the worst-case scenario tsunami associated with realistic as well as hypothetical tsunami sources. It should, however, be emphasized that the referenced tsunami hazard map is to be used only for local agency emergency planning and evacuation. This tsunami hazard depicted in this map is very conservative and not suitable for development planning. Tsunamis are rare events. Tsunamis that can generate waves in height that can significantly impact the subject trail alignment should be extremely rare.

8.5 Cut/Fill Recommendations

The proposed trail construction will involve mostly cut into and along the existing slopes for the majority of the alignment in order to achieve a mildly sloped trail, both transversely and longitudinally. As shown on the attached Typical Cross Sections included in Appendix E, the subject trail will be about 16 feet wide, with a 5 feet wide travel way and a 3 foot shoulder in each direction. In the longitudinal direction, the proposed trail will be constructed at a profile gradient ranging from about 2% to 5%. The trail will also have a cross-slope of 1% to 2%.

Construction of the trail segment from Station 10+00 to 23+00 will include cut to flatten the portion of the existing cut slope above the trail alignment to a 1.4:1 (h:v) gradient. The maximum depth of cut along the centerline of this segment of the trail is about twelve and a half (12.5) feet. Immediately south of the proposed bridge site, portions of the trail will traverse a small steeply rising ridge where the maximum depth of cut along the trail centerline will be about thirty (30) feet. For the next segment of the trail, to about Station 33+30, the maximum depth of cut along the trail centerline is about fifteen (15) feet. Along this segment of trail the existing slope above the trail alignment is proposed to be cut back to a gradient of 1:1 (h:v) with one or more benches. Construction of this segment of the trail alignment will also involve fill placement on the existing slope directly below the trail alignment, but above the existing dirt trail.

The segment of the trail from approximate Station 33+30 to about Station 36+00 will be constructed on fills placed on the existing slope. The maximum depth of fill, excluding any remedial over-excavation and backfilling, along this trail alignment will be on the order of about six (6) to seven (7) feet. Being located on fill sections, construction of this segment of the trail will also include new fill placement on the existing slope both above and below the trail alignment.

The proposed new fills will be placed at a gradient of 1:1(h:v) or less. We recommend that these fills be placed as compacted, geotextile-reinforced fill to prevent erosion and local/surficial slope instability.

The reminder of the proposed trail south of approximate Station 36+00 will involve cut of up to about two (2) feet along the trail centerline

As shown on the Plates C and D included in Appendix A, new fill placed along the ocean-facing slope shall be buttressed at the bottom and keyed/benched into competent slope materials by removing and re-compacting unsuitable surficial soils, including existing landslide debris, where present.

On-site cut soils consisting of cohesionless or low plasticity soils (PI<4) may be used as new fill material. Cut material from the highway-facing segment of the trail slope (north of the bridge site) consisting of Terrace Deposits (Qtm) and Santa Barbara Formation (Qsb) should be suitable for placement as compacted/reinforced fills.

All fill material should be provided with adequate back/subsurface drainage systems consisting of geo-composite or geotextile wrapped burrito-type sand drains placed against the excavated/remedial removal surfaces and prior to placing any fills.

8.6 Slope Stability Analyses

This section presents the results of our analyses performed to evaluate the stability of the slopes that may affect the service and stability conditions of the as-built trail. The topographic and geologic information shown on the Plates A through D in Appendix A, the soil/rock parameters in Table 1 and the design ground motion parameters presented above (Section 8.4.1.2) were used as the basis for these analyses.

The appropriate soil parameter types and their values, in particular those for shear strengths, depend on many factors including soil/bedrock characteristics such as constituent mineral types, particle sizes/characteristics, past deposition and stress history; moisture content or degree of saturation, permeability and the rate of loading, as well as the slope failure mechanisms being investigated.

Four (4) cross sections considered representative of the conditions along the proposed trail alignment were selected for the slope stability analysis. These cross sections are located at trail centerline Stations 16+10, 18+00, 28+56 and 33+90. Representative subsurface profiles with recommended soil/bedrock parameters were developed for each cross section based on the results of subsurface exploration. For slope stability analyses, the required soil/rock parameters included soil density and shear strength parameters, which were developed based on the results of the laboratory density and direct shear tests.

Slope stability analyses include limit equilibrium based soil slope stability analyses for all slopes and, a kinematic rock slope stability analysis for the highway-facing slope.

8.6.1 Limit Equilibrium Based Slope Stability Analyses

All limit equilibrium based slope stability analyses were performed using the software SLIDE, Version 6.0 (Rocscience, 2016). These slope stability analyses were performed considering circular types of rotational failures.

8.6.1.1 Static Slope Stability Analyses

The slope cross section models with geologic profile and geotechnical soil parameters, and the results of the static slope stability analyses are presented in Appendix D. In addition to the four (4) representative cross sections for the proposed grading conditions, a back analysis was performed for the mapped local landslide between approximate Sta 33+30 to Sta 35+00. Results of these analyses which indicated a factor of safety (FS) of about 1.0 for the mapped landslide mass, verified the accuracy of selected design soil density and shear strength parameters used in our slope stability analyses for the two sections located within the ocean-facing slope which are characterized by similar geologic conditions.

In general, a minimum static factor of safety of 1.3 is considered adequate (Caltrans 2014) for roadside slopes. The minimum static factors of safeties against slope failures obtained from our analysis for the four (4) representative locations along the trail alignment are summarized in Table 2 below:

Table 2. Results of Static Slope Stability Analyses

Location	Approximate Minimum Factor of Safety (FS)
Station 16+10	1.7
Station 18+00	1.9
Station 28+56	1.8
Station 33+90	1.4

Based on the above results, the subject slopes supporting the proposed trail alignment are considered to have adequate static slope stability conditions against overall or global failures.

8.6.1.2 Seismic Slope Stability

Based on Caltrans (2014), seismic stability of roadway slopes requires a minimum factor of safety of 1.1, using an equivalent coefficient of horizontal peak ground acceleration, k_h =1/3(PGA/g) or 0.2, whichever is greater. Thus, for the design peak ground acceleration, PGA=0.8g at the site, the design k_h is taken as equal to 0.2. Results of our seismic overall slope stability analyses are presented in Appendix D following the results of the static stability for each of the four (4) sections analyzed. These results are summarized in Table 3 below:

Table 3. Results of Seismic Slope Stability Analyses

Location	Approximate Minimum Factor of Safety (FS)
Station 16+10	1.2
Station 18+00	1.3
Station 28+56	1.3
Station 33+90	0.97

Based on the above results, the subject slopes, except the segment of the ocean-facing slope at or adjacent to the Station 33+90, for the as-built conditions of the proposed trail can be considered as adequately stable during the design seismic ground motion event.

For the cross section at Station 33+90, results of our seismic slope stability analysis indicated a FS=0.97, as compared with the required minimum FS=1.1. Based on these results, the portion of the ocean-facing slope from approximate Station 33+00 to the south end of the proposed trail is considered susceptible to lateral/downslope sliding when subjected to the design ground motion. Additional seismic slope stability and Newmark's rigid-body type deformation analyses (Newmark, 1965) was thus performed to evaluate the likely lateral displacements that this section of the slope may experience in the event shaken by a design ground motion generating earthquake event.

These analyses consisted of additional seismic slope stability analyses to evaluate the coefficient of yield acceleration (k_y) of the subject as-built slope. Results of these analyses are presented in Figure 7 (Appendix A), which shows k_y =0.175 for the subject slope. The yield acceleration is the seismic capacity of the slope in that the slope is stable (FS>1.0) for $k_h < k_y$. The slope is likely to experience incremental lateral displacement during ground shaking every time ground motion represented by k_h exceeds that represented by k_y.

Once the coefficient of yield acceleration (k_y) is known a slope, the seismic displacement due to the design ground motion, expressed in terms of the design PGA and the causative earthquake moment magnitude Mw, can be estimated based on published empirical corrections. Results of such an analyses performed based on the empirical correlation presented by Bray and Travasarou (2007) are presented in Figure 8. Based on this figure and a k_y =0.175, the estimated median seismic settlement is about 12.0 inches for the ocean-facing slope.

8.6.2 Kinematic Slope Stability Analysis

A kinematic slope stability analysis was also performed for the proposed cut slope adjacent to Highway 101, particularly from Station 18+00 to Station 24+00. Results of this analysis were presented in the referenced Technical Memorandum, dated October 16, 2018.

8.6.3 Surficial Slope Stability/Slope Erosion

Signs of localized soil erosion and surficial slope failures have be observed along portions of the existing slopes along the proposed trail alignment. Based on these field observations, the existing relatively steep slope areas containing highly weathered, near-surface formation materials or mantled by earth fill, slopewash, colluvium, landslide debris, and relatively cohesionless terrace and marine terrace deposits are prone to the effects of erosion and surficial instability.

8.6.3.1 Station 10+00 to Approx. Station 26+50 (Segments 1-3)

Along the trail alignment, from Station 10+00 to approximately Station 26+50, soil erosion and relatively shallow surficial failures were observed only on the upper part of the existing slope that was cut in the past to a 1:1 (h:v) gradient. No distress was observed on lower part of the existing slopes that were cut to a 1.5:1 (h:v) gradient. The proposed trail construction along this segment will involve cutting the upper portion of the slope to a flatter 1.4:1 (h:v) gradient.

Additionally, the following measures included in the current design of the cut slope should provide additional protection of the proposed multi-use trail and the existing highway facilities below.

- Alongside the trail alignment and at the base of the proposed 1.4:1 (h:v) cut slope, a six-foot (6') wide drainage swale is to be constructed. The drainage swale is to be lined with concrete for erosion/scour protection and to provide rock fall protection to both the trail and the existing highway facilities below.

- The proposed sixteen (16) foot wide trail with 5% cross slope will act as a bench on the slope providing both erosion and rock fall protection to existing highway facilities below, and aid maintenance crews in the removal of accumulated sediment and debris, if any, from the concrete-lined drainage swale, and long-term maintenance.

- Landscaping along the trail alignment are proposed at or near the end of the construction phase. Landscaping is expected to consist primarily of hydro-seeding using a native seed mix, and should provide additional erosion protection measures.

- The proposed cut will remove near surface weaker material exposing harder materials to the surface, and flatten the existing 1:1(h:v) upper part of the existing cut slope. This will result in an improvement to the existing stability conditions of the subject slope.

Based on the above, it is our opinion the proposed project will result in an improvement to conditions of the existing slope, and reduced potential hazard to the trail and the existing highway facilities below due to slope erosion, rock-fall and/or surficial failures.

8.6.3.2 Station 26+50 to Station 37+50 (Segments 4 and 5)

This segment of the trail begins near the top of the ocean-facing slope and traverses down and across the slope face. The southern portion this trail segment merges with an existing dirt trail located at about the mid-height of the overall slope.

Localized areas of shallow landslide debris, questionable landslide-affected materials, loose earth fill, slopewash and colluvial soil are present on the portion of the existing ocean facing slope located below the existing dirt trail. The conditions of these potentially unstable localized existing slope soils should be periodically observed during the service life of the proposed trail, and if necessary maintained/stabilized, to prevent significant deterioration which can affect the stability of the overall slope, including the subject multi-use trail located above.

The mapped landslides area between approximate Station 33+40 and Station 35+00 extend from below the existing dirt trail to above the proposed new trail alignment. It is affecting the stability of the existing dirt trail/bench and the ascending part of the slope at this location which will contain/support the proposed new trail and the associated proposed new fill to be placed above the existing bench. Therefore, this landslide area will require mitigation as part of the construction of the proposed trail. We recommend remedial grading of this area by way of construction of a buttress fill and keying into existing slope surface as shown on the Section at Station 33+90, Plate D, included in Appendix A.

Additionally, to prevent soil erosion and surficial slope instabilities, we recommend that all new fills, including the landslide remedial fills between Station 33+40 and Station 35+00, be placed as geotextile-reinforced engineered fill.

Based on the above discussion, it is our opinion that the potential hazards associated with erosion and localized/surficial instability of the areas of the slope containing and above the trail alignment should be low provided the grading recommendations are incorporated in design and construction of the project.

8.7 Bridge Foundation Design Recommendations

The proposed trail project includes a new bridge over the depressed UPRR rail corridor. For convenience, a copy of the proposed plan view and cross section profile along the bridge centerline are reproduced in Figure 9, as attached in Appendix A.

Based on the exploration borings DH 07a and DH 07b, drilled near the proposed bridge Abutment 1, and our observation of the surface conditions, the proposed bridge site, as shown on Figure 8, is underlain by moist to slightly moist, well-bedded, slightly to moderately hard diatomaceous shale/siltstone and hard siliceous shale of the Monterey Formation (Tm).

Based on the relatively hard subsurface conditions and high design ground motion (PGA=0.8g), we recommend using drilled shafts as the bridge foundation. Based on the relative short bridge length and anticipated low support loads, we recommend using Caltrans Standard Plan 24" Cast-in-Drilled-Hole (CIDH) Concrete Pile with a 200-kip design capacity.

Based on Caltrans current practice the bridge abutment foundations need to be designed for the Service and Strength Limit States in accordance AASHTO LRFD BDS (2012), 6th Edition with California Amendments (Caltrans, 2014).

8.7.1 Axially Loaded Pile Design Parameters

Based on Caltrans current practice abutment piles need to be designed to support axial load based on the LRFD Service Limit State 1 Load Combination without exceeding 2.0 inches of settlement.

For LRFD Strength Limit State, piles in axial compression are required to be designed with a side (or skin) resistance factor of 0.7 or less and a tip resistance factor of 0.5 or less. The nominal structure resistance of the Standard Plan 24" CIDH piles is 400 kips. It is assumed that the factored load per pile from the Strength Limit State load combination will not exceed 280 kips.

Based on the results of an axially loaded pile analysis, presented as Figure 10 included in Appendix A, the recommended design pile length is forty-three (43) feet to support a factored load of 280 kips per pile.

8.7.2 Lateral Loaded Pile Design

Recommended soil parameters for laterally loaded pile analysis using the p-y method are presented in Table 4 below:

Table 4. Recommend Design Soil Parameters for p-y Type Laterally Loaded Pile Analysis

Depth below Cut-off Elevation (ft)	Soil Type	Total Unit Weight (pcf)	Shear Strength Parameters		k_s/k_c (pci)	ε_{50}
			Cohesion, c (psf)	Friction Angle, ϕ(degrees)		
0-20	Silt (ML/MH)	95.0	850	43	150/280	0.009
20-60	Silt (ML/MH)	100.0	1500	43	500/280	0.007

8.7.3 Foundation Settlement

Based on the subsurface conditions, the pile diameter (24") and the anticipated service load per pile (e.g., 200 kips or less), abutment support settlement should be less than the permissible support settlement of two (2) inches for single span bridges.

8.8 Retaining Walls

The proposed project includes construction of an approximately seven (7) to eight (8) foot high, seventy-five (75) to eighty (80) foot long retaining wall along the existing mid-slope bench, from ~Sta 30+71 to ~ Sta 31+46, as shown on Plate D in Appendix A. Based on the location and relatively small height, we recommend construction of a geo-synthetic reinforced, mechanically stabilized wall at this location. Such a wall can be designed based on the following foundation soil parameters:

- Total Unit Weigh = 100 pcf
- Cohesion = 300 psf
- Friction Angle = 27 degrees
- Coefficient of Active Earth Pressure = 0.38
- Coefficient of Passive Earth Pressure = 2.7

For a minimum wall width of five (5) feet and two (2) feet of soil embedment, the allowable bearing capacity of the in-situ soils may be taken as 1,500 psf. The wall should be founded on firm, undisturbed native earth materials, or engineered fill placed on firm native earth materials. Existing unstable subgrade (i.e. soft/weak, disturbed soil or undocumented fill soils), if any, should be removed and re-compacted prior to wall construction.

8.9 Pavement Design Recommendations

Results of R-value tests performed on two soil samples retrieved from the ocean-facing slope (Boring DH-01 and DH-02) are included in Appendix C. The two samples tested consisted of sandy clay with gravel. Based on these results, the R-value of the soils tested may be taken as equal to 45. This R-value may be also for the anticipated subgrade soils along the highway-facing slope.

The trail structural section is designed assuming occasional access need for maintenance and emergency vehicles. For the purpose of Portland Cement Concrete (PCC) pavement design, the subgrade soils along the trail alignment can be classified as Type II, as defined in Table 623.1A of the Caltrans Highway Design Manual (Caltrans, 2017). The PCC pavement design and construction need to consider the corrosive nature of the subgrade soils and the close proximately of the subject trail to salt water

A minimum structural section consisting of 5.0 inches Jointed Plain Concrete Pavement (JPCP) over 4.0 inches of Class II aggregate base is recommended for the subject trail. Portland Cement Type IV should be used. Plate dowels, ¼- to ½-inch in thickness, should be considered, instead of bars, for load transfer across the joints.

We recommend that, prior to the placement of the AB layer, at least the upper eight (8) inches of exposed subgrade soils should be scarified, moisture conditioned to within ±2.5 percent of the optimum and compacted to relative compaction of at least 90% maximum dry density determined as per ASTM Standard D1557.

Unless specified otherwise herein, pavement section detailing, material selection and construction should meet the requirements for JPCP specified in the Caltrans Highway Design Manual (Caltrans, 2017) and Standard Specifications (Caltrans, 2015a).

8.10 Drainage Recommendations

All surfaces should be graded to direct runoff to non-erosive collection, distribution and discharge drainage devices. Run-off should not be permitted to flow uncontrolled on-site or off-site.

All new fills placed against existing slope surfaces should be provided with adequate subsurface drainages consisting of geo-composite or geotextile wrapped burrito-type drainages placed on the final slope surfaces prior to the placement of any fill. Sub drains should be installed where necessary to facilitate drainage or percolation of water from the trail pavement base and subgrade materials.

8.11 Corrosion

Results of a number of chemical test performed on samples retrieved from ocean-facing slope are included in Appendix C. Based on these results, the sulfate and chloride content of the soils tested ranged from 462 to 3042 ppm and 280 to 2900 ppm, respectively.

Based on the Caltrans' current corrosion guidelines (Caltrans, 2015b), a site is considered corrosive to structure elements if one or more of the following exists for the representative site soil and/or water.

Chloride concentration is 500 ppm or greater, sulfate concentration is 2000 ppm or greater, or the pH is 5.5 or less.

Therefore, based on the results of the chemical tests soils along the subject trail alignment should be considered corrosive to common construction materials, including both steel and concrete.

9.0 HAZARDOUS WASTE POTENTIAL

It is our understanding that there are no known hazardous wastes along the proposed trail alignment. We also know of no existing hazardous waste studies or reports within and adjacent to the trail alignment.

10.0 CONSTRUCTION RECOMMENDATIONS

This section presents construction recommendations for the proposed improvements.

- All construction activities should be performed in conformance with the applicable requirements of the US Federal and California Occupational Safety and Health Administration (OSHA/Cal-OSHA).

- All construction shall conform to the requirements of the Caltrans Standard Specifications (Caltrans, 2015), except as specified otherwise herein.

- All earthwork and foundation construction activities, including but not limited to clearing and grubbing, removal/replacement of unsuitable/landslide debris, slope cut, fill placement/compaction, backfilling, drainage installation, subgrade preparation, placement and compaction of pavement materials, and bridge foundation installation, should be performed under the observation of the owner's geotechnical representative.

- All surfaces to receive fills, pavement or foundations should be scarified to a depth of at least eight (8) inches, moisture conditioned, if necessary, and re-compacted to at least 90% of the maximum density determined as per ASTM Test Method D1557.

- If subgrade or subsurface conditions different that those encountered during the field exploration, as documented in this report, are encountered during construction, this office should be contacted immediately so that actual ground conditions can be evaluated and, if necessary, revised or modified recommendations can be provided.

- Select excavated site soils consisting of silts (ML) with PI<4, silty sand (SM) and sand (SM/SP) may be used compacted fill.

- Wet, soft/weak, pumping or yielding subgrade soils, if any, should be stabilized prior to additional construction activities. Stabilization may include removal and replacement of wet or soft materials to depths determined based on field conditions.

- When new fills are to be placed on natural or existing ground steeper than 5:1(h:v), compacted fill should be keyed and benched into firm materials. Back drains should be installed, where necessary, to intercept water entering into new fills.

- Oversize materials such as rock greater than eight (8”) inches in largest dimension should not be buried or placed in fills. Rocks larger than three (3”) inches should not be placed within the upper five (5) feet of fills placed directly beneath the trail pavement section.

- Fill and cut slopes should be graded and hydro-seeded to reduce water-induced surficial erosion and sloughing. Permanent erosion control measures should be implemented immediately after the completion of slope construction.

- All surfaces should be graded to direct runoff to non-erosive drainage devices and should not flow uncontrolled off-site.

- Sub drains should be installed where necessary to facilitate drainage or percolation of water from trail base materials.

- All compacted fill should be placed in horizontal lifts 8 inches or less in un-compacted thickness and compacted to at least 90% of the maximum dry density and at moisture contents within ±2.5% percent of the optimum as per ASTM D1557 method.

- All pavement materials should be selected, and construction works should be performed, in accordance with Caltrans Standard Specifications (2015a) and/or the Green Book- Standard Specifications for Public Works Construction (BNI, 2018).

- Cast-in-drilled-hole (CIDH) piles for the proposed trail bridge should be constructed in dry conditions.

- Hard excavation/drilling conditions should be anticipated during the CIDH pile installation.

- Groundwater seepage may be encountered in the CIDH pile holes. If encountered, seepage water shall be pumped out of the hole to maintain dry conditions until the placement of reinforcement and concrete.

- The bottom of the CIDH holes must be clean and free of any loose//soft soil or other debris prior to placing reinforcement and concrete.

- The embedded CIDH pile length recommended herein should not be shortened during construction.

- Unless specified otherwise here, CIDH pile materials and construction shall meet the requirements specified in the Caltrans Standard Specifications (2015).

11.0 CONCLUSIONS AND RECOMMENDATIONS

The following conclusions and recommendations are based on the results of our current geotechnical exploration as discussed above and presented in the various attached appendices:

- The proposed trail alignment traverses through and located on the face of relatively steep hill sides with variable subsurface conditions.

- The portion of the trail alignment located on the hill slope facing the Rincon Road on-ramp to Southbound Highway 101, directly underlain by marine terrace formation (Qtm) consisting of sand, and bedrock of the Santa Barbara Formation (Qsb) consisting of silty sand and sand-like material, and bedrock of the Monterey Formation(Tm) consisting mainly sandy silt/silt (MH/ML) like siltstone/shale.

- The reminder of the trail alignment, including the proposed bridge and the trail alignment traversing through and located on the face of the ocean facing hill side is underlain directly by bedrock of the Monterey Formation (Tm) siltstone/shale and Sisquoc Formation (Tsq) siltstone/mudstone both consisting mainly sandy silt/silt-like (MH/ML) materials.

- To construction the trail on the slope faces with mild cross slope (2 to 5%) and maintain mild longitudinal gradient (≤5%), cut both along the trail centerline alignment and the slope portion above the trail alignment are necessary for the majority of the alignment.

- The proposed trail will cross the surface trace of the Carpinteria fault, a high-angle, south-dipping reverse fault which trends north of west through the project limits. Work by others on the adjacent parcel(s) to the west suggests that additional faults may be present, though no evidence has been found to suggest that these faults or suspected faults have been active in the Holocene. The City of Carpinteria (2003) and other sources suggest that the Carpinteria Fault be considered “potentially active” (faults which show evidence of Quaternary displacement) for planning purposes. Neither USGS nor CGS considers the Carpinteria Fault to be “potentially active”. Caltrans (2012) does not include this fault in its fault database for consideration in the design of highway facilities. Therefore, the potential for fault surface rupture within the project limits is considered low.

- However, due to its location in a highly active seismic regions with numerous nearby active and potentially active large faults, e.g., Mesa-Rincon and Red Mountain faults, , the trail alignment is susceptible to relatively high design ground motion as defined by Caltrans (2013). Based on our analysis, he design PGA at the site is about 0.8g generated by an earthquake of moment magnitude M_w=7.4.

- Our subsurface investigation and geologic mapping indicates that, from a slope stability perspective, the slopes along the coastal bluff, both above and below the existing unsanctioned County trail (approx. Sta. 27+00 to 37+50) are most problematic, mainly with respect to local/surficial slope instability. Areas of landslide debris, colluvium and questionable landslide debris have been mapped along this section of the proposed trail corridor.

- The proposed grading plans was reviewed and existing slopes and proposed cut slopes were analyzed for gross stability. Shear strength test results were obtained and both limit equilibrium and kinematic based slope stability analyses were performed to evaluate the global or overall static as well as seismic loading conditions.

- Based on our slope stability analysis, the subject slopes containing the proposed trail alignment are considered to have adequate stability against static loading or under normal, short and long term service conditions.

- Due to the relatively low shear strength of the Monterey and Sisquoc Formation (Tm and Tsq) and the slope face orientation, the existing ocean-facing slope south of the proposed trail bridge is considered to be susceptible to surficial/local instability under static conditions. This portion of the slope is also considered susceptible to both surficial and overall slope movements during the design seismic ground motion event.

- We recommend that all new fills placed along the trail alignment be placed as engineered geotextile-reinforced soils with subsurface/back drains. Additional recommendations include constructing adequate surface drainage facilities to collect and disposing of surface-run off properly and hydro-seeding the exposed newly cut and fill surfaces. These measures, in conjunction of the slope flattening and load reduction resulting from the proposed slope cut backs, should significantly reduce the hazards associated with both slope erosion and local/surficial slope instability under both static and seismic loading conditions.

- Due to the relatively low shear strength and steep gradient, the portion of the ocean facing slope between Station 33+90 and the south end of the proposed trail is considered susceptible to seismically induced limited lateral deformation, estimated to be on the order of about 12 inches, in the event shaken by the design seismic ground motion event.

- In addition, the portion of the existing slope located below the existing dirt trail and beyond the limit of the proposed trail construction is considered susceptible to local/surficial slope instability. This portion of the slope should be monitored and, if necessary, stabilized periodically to prevent affecting the stability of the trail and the overall slope.

- Due to relatively low strength of the underlying Monterey Formation (Tm) siltstone/shale bedrock, deep foundation is recommended for supporting the proposed single-span trail bridge abutments. Due to relatively hard excavation conditions, cast-in-drilled holes (CIDH) pile type is recommended. Based on the anticipated loadings, Caltrans Standard Plan 24" Cast-in-Drilled-Hole (CIDH) Concrete Pile with 200 kips design capacity is recommended.

- Subsurface exploration was performed utilizing hand labor, backhoe and drill rig. Extremely hard layers of bedrock were locally encountered. Thus, excavating into the bedrock during construction may be difficult. Should hard cemented bedrock be encountered during the installation of the CIDH piles, coring may be necessary.

- A qualified professional from Bengal Engineering should be present at all times during construction to observe and document actual field conditions and construction of the recommended improvements and, if necessary, provide updated recommendations.

- Finally, it is our opinion the proposed project is feasible, from the geotechnical point of view, provided findings and recommendations included in this report are considered in both the design and construction of the proposed improvements.

12.0 LIMITATIONS

Subsurface conditions at the site were determined on the basis of our field explorations at limited locations and review of the available and pertinent existing information. Our scope of work was limited to the study area along and adjacent to the proposed trail alignment. It does not extend beyond the proposed graded slope areas shown on the attached civil layout plans.

Due to the location of the trail alignment, slope areas located outside the grading plan may influence the stability of the as-built trail in the future. Evaluation of the current or future conditions of and/or design for the stability of these slope areas outside the proposed grading limits and their future impacts on the stability of the as-built trail, if any, is outside our scope of work for the subject project.

Many recommendations presented herein are for the specific soil/bedrock conditions encountered at specific locations. They may not have any applicability to other situations or conditions, or construction types. Bengal Engineering, Inc. accepts no liability for use or reuse of the content of this report for other purposes or by others.

Conclusions and recommendations presented herein are based on our experience and professional judgment. Therefore, the conclusions and recommendations are professional opinions and are not meant to indicate a control of nature.

Services provided by Bengal Engineering, Inc., have been conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession currently practicing in the area under similar conditions. Bengal Engineering makes no other warranty or guarantee, either expressed or implied, concerning the content of this report.

This report has been prepared by the registered professionals whose seals and signatures appear hereon.

X. GENERAL COMMENTS

Discharge of TCE to soil and groundwater from USTs. This case was also worked on my Santa Barbara County and was formerly in GeoTracker as Infrared Industries UST case (T0608300037) SB case #50288. This was not a typical UST case because the USTs contained solvents and was therefore not part of the Tank Fund. To avoid confusion, all of the files from the UST case were merged into this Infrared Cleanup Case and the former UST case was deleted.

08-08-2017: ALL HARD COPY FILES FROM REGION 3 RECORD STORAGE HAVE BEEN UPLOADED TO GEOTRACKER FOR THIS SITE.

X. GENERAL COMMENTS

Site was originally opened in 2012 following identification that the plugged and abandoned oil well, Kittie Bailard #1, located on the Carpinteria Bluffs preserve, appeared to be seeping oil. The well was originally plugged and abandoned under DOGGR oversight

in 1929. Also of note is that there are a number of natural oil seeps in the immediate vicinity including oil that seeps out of the sea bluff immediately to the south of the well. Following environmental review by the City of Carpinteria, ConocoPhillips excavated the well head and confirmed that oil was seeping up around the inner well casing. The work was performed with oversight by DOGGR, the City of Carpinteria and Santa Barbara County Environmental Health Services, Site Mitigation Unit (EHS-SMU). C/P proceeded to replug and abandon the well to current standards under DOGGR oversight. C/P performed a remedial excavation of nearly 74 tons of oil contaminated soil in 2013 and submitted the remedial action completion report and request for closure on May 20, 2013. EHS-SMU issued a closure letter to ConocoPhillips on August 26, 2013.

In January 2017, ConocoPhillips was notified that an oil seep had again been observed near the Kittie Bailard oil well and returned to the site to contain the seep and investigate. C/P contractor, ATC, installed straw wattles, high visibility fencing, signs, and protective bird block fabric mesh around the oil seep. C/P subsequently excavated the wellhead for inspection by various stakeholders and regulatory agencies including the City of Carpinteria, DOGGR and EHS-SMU. No oil was observed seeping around the wellhead and the existing seep was noted to be east of the wellhead with surface dimensions of 6-feet long by 3/8 inches wide and oriented east to west. Additionally, ATC performed leak-check investigation for volatile organic hydrocarbons, hydrogen sulfide and carbon dioxide. The field monitors did not detect any gases leaking from the well. All stakeholders concurred the current seep did not originate from the well but appeared to be a natural seep. While the surface seep was not C/P's responsibility, they proceeded to remove, transport and properly dispose of the oil-impacted soil. Cleanup of visually impacted soil was completed but no verification sampling was required and the case closed on November 15, 2018.

SOIL

Site History

This site has been historically used for agricultural purposes from 1928 to 1989, the property was used for citrus orchards. The property was cleared and used for the cultivation of flowe the time of the site assessment in 1996, the site was still planted in flower.

Appendix G

Drainage System Feaibility Discsusion

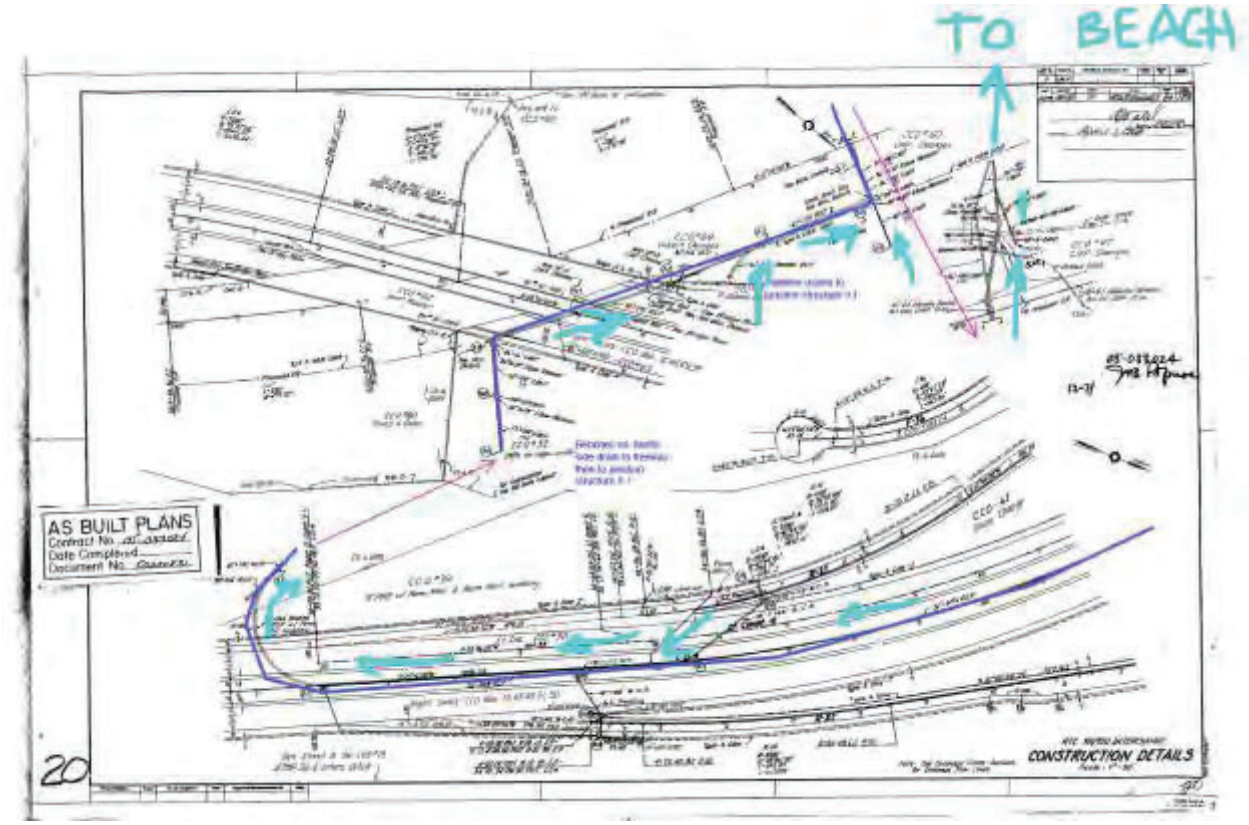
Drainage Overview

This project is located in a coastal setting where heavy rains are likely to occur regularly. These rains will bring some sediment and perhaps rockfalls, which will likely be heavier in the earlier years, diminishing as vegetation becomes established.

In order to minimize maintenance and to protect the substantial investment in the project, along with concern for the safety of the users, designers feel it is important to provide adequate drainage systems including graded drainage benches where feasible. Such was the concept used during the original construction of the railroad and Hwy 101.

Aerial view looking south: Bengal photo

Note the benches built to control drainage on the cut slopes above the US 101 Highway to protect these facilities.

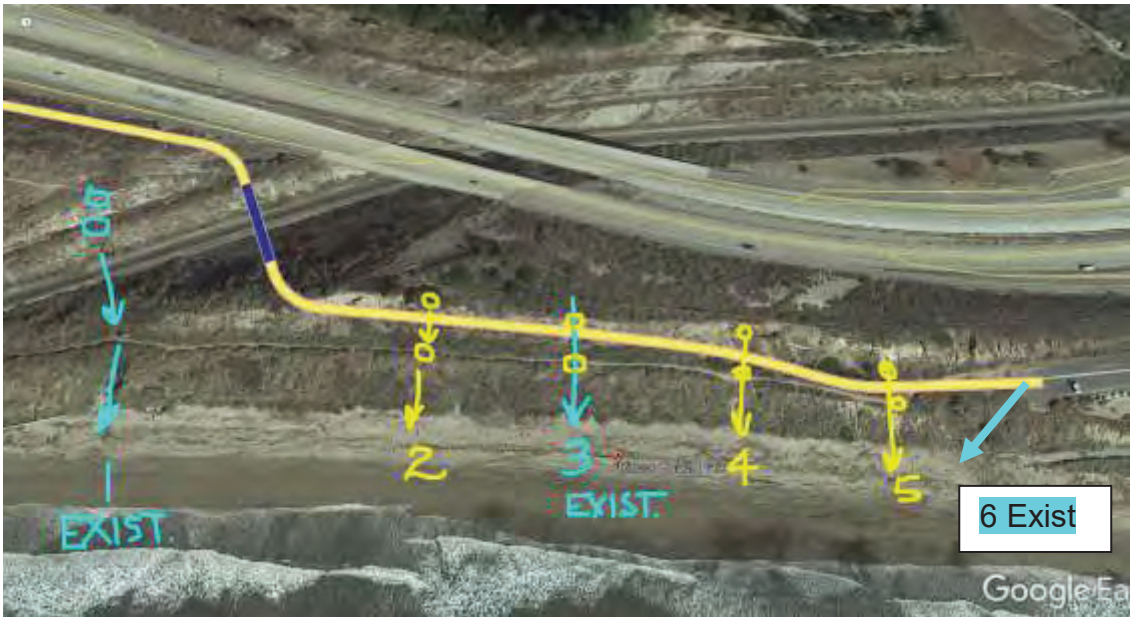


Drainage on Freeway Side of the Project

Designers of Hwy 101 routed all the drainage west of the “wave overhead” (the freeway bridge crossing the UPRR) down the median of the freeway then sweeping along the lower bench above the railroad, then descending to the beach (light blue arrows below). Note this existing system passes under the Union Pacific railroad tracks before it descends to the beach.

Above: Existing Drainage Paths (light blue); Proposed Drainage Path (yellow) . Note that on the freeway side of the UPRR, because the new trail will intercept the water which currently drains either to the existing mid-slope bench or to the southbound ramp below, engineers will include a drainage v-ditch along the trail. This v-ditch will convey water to the existing drainage system, as shown in the yellow arrows above.

As-Built Drawings of Hwy 101 Drainage



As-built construction plan showing drainage system. Note the freeway drains to the beach.

It is important to understand that as part of the construction of the Rincon Trail, neither the volume of water entering the system, nor the point of discharge on the beach would be changed.

Description of Proposed Drainage on Ocean-side of Project

South of the railroad, Bengal anticipates the need for at least 6 drains to the beach.

[existing drain 6 shown below was discovered in 2019]

View of the Ocean-side of the project: The first drain at the left (west) is the existing system from the freeway, mentioned previously, and shown in the as-built drawings.

View of Drainage Stystem #1 from ocean side of UPRR. Note this drain accepts all the drainage from both sides of the freeway, including the down-drains far in the distance (photo, top right).

View of the outfall of drainage system Number 1 as seen from the beach. Note old concrete sea wall and broken concrete “rip rap” along with remains of the corrugated metal pipe down-drain. The proposed project would not affect this existing facility.

Drainage systems 2, 4 and 5 are proposed as part of the project. These are important design features because they will capture water before it becomes concentrated and flows into the parking lot. Note that if this water is unchecked, it could flow through the Rincon Beach parking lot, and all the way to Bates Road. Designers believe that these vertical drains are imperative for the success of the project and underscore the need to obtain the permits to build them.

Drainage system #3 will replace an existing drainage system which has rusted out.

A view of drainage system #3 as seen from beach. Note that it drains not only the old rail bed, but it originally drained the old state highway. It has since rusted away due to lack of maintenance.

View of the existing drainage system #3, looking westerly along the old Southern Pacific Railroad rail bed. Note the rusty pipe visible at the left, oriented parallel with the old rail bed, is an old communications line, now abandoned. Drainage system #3 passes under it, in-line with the yellow tape measure shown in the photo.

Space Limitations for "Infiltration" Systems

Current engineering practices are evolving to include the use of infiltration measures to limit both the volume of run-off and the amount of sediment.

This project faces the same narrow footprint available for grading which faced the engineers who built both the railroad and the freeway in the past. Because of these space limitations, and because implementation of an infiltration system will add water to the soils, likely reducing their stability, such methods do not appear to be a practical fit for the project as it is currently proposed.

Factors Guiding the Suggested Approach for Drainage Design

The proposed drainage design includes multiple down drains leading to the beach. This approach has been selected based on careful consideration, described next.

Performance of Past Projects

If one visits the site, one can see past projects including both the new and old railroad alignments, the old State Highway 2 (which existed on the ridgeline before Hwy 101 was constructed), the County Park, and Hwy 101, all included drainage systems to protect their investments. Some still function—some are rusty metal skeletons and crumbling concrete relics. These systems have had varying degrees of success. Most were built as “downdrains”, as we suggest in the proposed project.

But one these systems is a complicated trunk line storm drain: the Caltrans-constructed “Drainage System Number 3” (mentioned in the record drawings above). Today, the difficulties facing Caltrans maintenance crews for such a complicated trunk line are evident to the designers of the Rincon Trail. This system has no maintenance openings for hundreds of feet—including the railroad crossing. This system cannot easily reached from the old railroad bench or from the beach. And this system also provides no redundancy—no ancillary inlets to accommodate blockage. So should any part of it become blocked, we can expect damage which will be difficult to repair.

Rainfall Intensity: the Future May be Harsher than the Past

Today, engineers expect rain, including heavy rain, at this location. Growing concerns regarding changing climate may prove that heavier rains will be a “new normal”. For example, the nearby 2018 flooding in Montecito, was caused not only because of the Thomas fire, but also because of freakishly high rainfall intensity. The results from the plugged drainage systems near Olive Mill Road, which closed the freeway for weeks, are still fresh in our minds.

As it turned out, the existing storm drains which functioned OK for years, failed during the time of greatest need. Rob Lewin, OEM Director, said, “The storm we got was not the storm we prepared for.”

Rockfalls could plug an individual downdrain

Because of the nature of the soil in the area, engineers expect that historic rock falls, which are partially-driven by rain, will continue to occur in spite of the proposed cut slopes which are less-steep than those which exist. Such rock falls could plug any drainage system. Therefore engineers have provided redundancy to avoid “having all our eggs in one basket”.

Access to remove rockfall.

Designers believe that the project should provide access to remove rockfall debris especially the upper slopes during in the early years of service. Designers envision that rockfall will decrease with time as slopes mature and perhaps some vegetation takes purchase. But given the low organic content in the soils, along with the southern exposure to the sun, designers do not expect to see well-vegetated slopes, based on what we see in the old cuts made by Southern Pacific Railroad.

However new "fills" which will be made below the path will be reinforced with geosynthetic materials, and we envision using a mantle of topsoil on the daylight face of the fill slope to provide better soil vegetation in the zone below the bike path and above the old railroad bench.

Project Engineers Strive to Simplify Maintenance

The designers (engineers) anticipate that agencies like the City of Carpinteria and Santa Barbara County will have shrinking resources: less staff and budget: available to maintain any infrastructure. Therefore the designers prefer designs which avoid the need for specialized equipment or staff; "simpler is better". Even if staff and budget are generous, experience has shown that complicated designs generate complicated maintenance scenarios, and are difficult to understand by emergency crews who will likely be responding in bad weather often at night (like the 2018 Montecito Flood).

Other Drainage Design Concepts Which Were Considered

Facing the challenges mentioned, engineers implemented a design with multiple down drains. However engineers also considered several other ideas, described next:

A) **A trunk line storm drain following the old railroad bench**
We considered a trunk line like the Caltrans "Drainage System 3". This trunk line could descend to the beach near the west end of the County park in a single down drain. The driving force for this concept was considered to minimize the number of drains to the beach.

This concept was disregarded because:

- Likely this trunk line would conflict with a Frontier Fiber Opitic line which already occupies this area in a dedicated easement; this fiber optic line runs the full length of the bench and then into the parking lot.
- Such a storm drain will be much more difficult to maintain. Access below the paved trail would be particularly limited, unless the trail alignment is shifted toward the freeway, generating more cut in the process.

- The existing bench is narrow in places. There is not much room for such a storm drain.
- This bench has areas which will be stabilized by engineering (reinforced fills). Construction will be difficult as the storm drain will conflict with the reinforced fills, a situation we seek to avoid.
- The system has no redundancy—which leads to the next point.
- Should any part of this drain fail, greater damage is expected as "all our eggs will be in one basket".

View of the proposed west end of the trail, near Rincon Park, March 2018.
Note gate, demarking the end of the paved parking lot.
Note muddy conditions which develop due to lack of drainage systems.

B) A trunk line storm drain following the proposed "trail" bench, buried below proposed trail

This concept was disregarded because:

- As mentioned, Rain and rockfalls seem to be certainty, therefore a design which allows for them seems best.
- We envision the upper trunk line B will be plugged at some point. In worse case it could flow off the paved path, uncontrolled.
- Because the slopes *below* the paved trail will not be protected by a drainage system, therefore we'd still need trunk line A, and likely face most of the detriments already mentioned.

C) A combination of 2 trunk lines—A+B, combined.

We considered 2 smaller trunk lines, combining the ideas of A) and B). This idea was disregarded because:

- The detriments of each trunk line: still remain, likely in spite of much higher cost.

View of old retaining walls which remain from State Hwy 2, near Rincon Park, March 2018.

Note that these old walls will be removed as part of the project to make room for the trail and drainage improvements. Drainage at this location appears to have been a problem since construction in 1929.

NOTES

1. FOR COMPLETE RIGHT OF WAY INFORMATION, SEE MAPS IN THE CITY OFFICES.
2. THESE PLANS ARE FOR THE LAYOUT AND CONSTRUCTION OF THE DRAINAGE FACILITIES.
3. EXISTING DRAINAGE SYSTEMS ARE GIVEN IDENTIFICATION FROM CAL TRANS 1968 DRAINAGE PLANS
4. APPROX 10-FOOT X 10-FOOT PAD OF 2 TON RIP RAP AT OUTFALL OF DRAINAGE SYSTEMS 3,5,6,7&8

Airflow Analysis

Airflow analysis for the proposed regrading of the Rincon bluffs

Paolo Luzzatto-Fegiz, PhD

January 22, 2021

Summary

This report provides an estimate of the change in vertical air velocity over the Rincon bluffs, as a consequence of the regrading associated with the proposed Rincon trail project. The analysis uses methodologies informed by a review of published scientific studies, civil engineering codes, as well well as practices from the paragliding and soaring communities. The analysis focuses on the specific case where wind is approaching perpendicular to the bluff, which is the case of greatest practical relevance.

As a consequence of the proposed regrading, the vertical wind velocity above the front of the bluff is expected to decrease by an amount between 10% and 30%. The addition of horizontal sections (that is, benches) in the bluff profile is likely to introduce some additional turbulence, which however is expected to remain close to the surface of the bluff, without significantly affecting altitudes greater than approximately 75ft above the bluff. A regrading involving one fewer bench near the bluff top is estimated to provide a reduction in vertical wind velocity between 10% and 20%.

1 Relevant prior work on topographic amplification and ridge lift

Although numerous studies have examined the effect of topography on local wind velocity, the focus in the literature has been predominantly on developing predictions for wind loads on buildings. Studies have therefore typically focused on horizontal wind speeds and on gust velocities near the surface. By contrast, the vertical wind velocities induced by topography have received little attention. A review of relevant studies follows below.

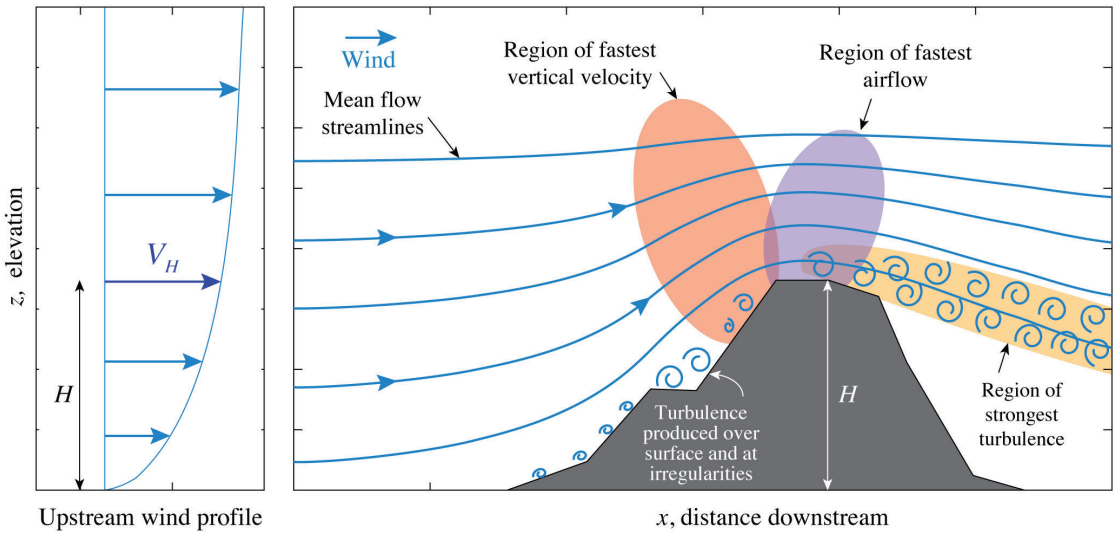

Figure 1: Sketch of the key aerodynamic features of flow over topography, based on academic literature (e.g. Jackson and Hunt, 1975), engineering codes (e.g. American Society of Civil Engineers, 2017) as well as soaring literature (e.g. Crawley and Schmanske, 1994; Pagen, 1992, 2001). The left-hand panel shows the definition of the reference velocity V_H, which is the velocity of the undisturbed flow at the elevation of the top of the topography.

1.1 Wind amplification over topography

The study of wind acceleration over topography received its formal foundation in the theoretical modeling work of Jackson and Hunt (1975); this and subsequent efforts are summarized in the review of Belcher and Hunt (1998). Although their quantitative predictions are limited to gentle hills (and are therefore inapplicable here), their qualitative analysis of the aerodynamics of complex terrain remains relevant even for steep topography, and is illustrated in figure 1. The airflow accelerates over the terrain, as the flow is essentially forced to move through a smaller area; this is associated with a contraction of the streamlines in figure 1 (here, streamlines are used to illustrate the time-averaged path of the airflow). The region of fastest airflow occurs at the top of the topography, where the distance between the streamlines is smallest; this region is shown by the purple shaded region in the figure. The region of fastest vertical velocity (which is of relevance to soaring activities) occurs at the front of the topography, and is highlighted by the orange region in the figure.

Over the front of the topography, the interaction between airflow and surface roughness (such as vegetation, structures, or uneven terrain) and with more significant irregularities (such as benches) produces turbulence. This turbulence is transported by the mean airflow, and therefore moves essentially along the streamlines. As a result, at the front of the topography, the turbulence remains confined to a relatively thin layer near the surface. At the top of the topography, this layer grows in thickness, forming a region of stronger turbulence that can separate from the topography and is transported downstream; this is represented by the yellow region in figure 1. This qualitative overview of the flow is consistent with experiments, field measurements, recent engineering standards, as well as with the literature on soaring, as described below.

Bowen and Lindley (1977) performed wind tunnel experiments that systematically investigated the effect of steep topography on airflow. They measured horizontal velocities around topographies with front slopes varying from 4:1 to a vertical cliff; some of their results are shown later in figure 3. Bowen and Lindley (1977) found that, for small slope angles, an increase in slope yields a

corresponding increase in the maximum velocity above the topography. However, once the slope angle is increased past approximately 2:1, the maximum flow velocity no longer increases significantly, and instead remains around 1.8 times the wind velocity upstream of the topography. Bowen (1980) later showed that, for the front and top regions of the topography, field measurements at full scale agreed closely with the wind tunnel experiments of Bowen and Lindley (1977). For the region behind the topography, differences between wind tunnel and field measurements were found for front slopes steeper than 1:1. Bowen and Lindley (1977) and Bowen (1980) found that surface-generated turbulence remained confined to the near-surface region over the front of the topography, as it was essentially transported by the mean flow. Several other laboratory and field measurements have also supported these findings (including Hauf and Neumann-Hauf, 1982; Lange et al., 2016; Liu et al., 2016).

Theoretical predictions of the airflow over steep topography are challenging. Bowen (1983) summarized available theories for the "outer" flow (which is unaffected by the turbulence), noting that theories perform poorly once the slope exceeds 2:1. This was also confirmed by Jensen (1983) and Glanville and Kwok (1997), who compared theory to field data and reduced-scale experiments. In addition, Bowen (1983) and Jensen (1983) discussed the difficult question of choosing approximate representations for complex topographies; these works inform our choices of approximate bluff profiles later in section 2. Overall, this review of past efforts suggests that, for topographies steeper than 2:1, it is best to rely on empirical or semi-empirical modeling approaches, rather than on theoretical analyses attempting to model the overall flow.

The results from wind tunnel experiments and field measurements reviewed above have been effectively implemented in engineering codes, such as ASCE 7-16, which provides semi-empirical relations for the maximum horizontal wind and gust velocities (American Society of Civil Engineers, 2017, p. 266; other engineering codes for flow over steep topography have been reviewed by Safaei Pirooz and Flay, 2018).

1.2 Vertical wind velocity over topography

To the best of our knowledge, current engineering codes do not provide relations for predicting vertical wind velocity at the front of steep topography; vertical wind velocities are rarely reported in experiments or field measurements.

In the soaring literature, a common approach for estimating vertical velocity over topography is to assume that the airflow is locally parallel to the surface (Crawley and Schmanske, 1994; Pagen, 1992). The vertical wind velocity is therefore obtained by multiplying a reference wind velocity V_{wind} by the sine of the slope angle α,

$$V_z = V_{\text{wind}} \sin \alpha. \tag{1}$$

This approach, involving equation 1, is used for example in the book by Pagen (1992) to prepare their figure 139 on p. 158, although this does not appear to be made explicit in their presentation.

If the reference wind velocity V_{wind} is based on the flow upstream of the topography, equation 1 underestimates the actual vertical velocity V_z, as it neglects flow amplification, which is significant near the top of the topography. To address this issue, Crawley and Schmanske (1994) proposed a semi-empirical expression accounting for amplification, based on wind tunnel experiments. They tuned their expression to estimate vertical velocity at an altitude $H/8$ above the topography (which has maximum elevation H; in their specific experiments, this corresponded to a soaring altitude of 150 ft above the surface). Their expression is

$$V_z = V_{\text{wind}} \frac{cH}{cH - z_{\text{topo}}(x)} \sin \alpha(x), \tag{2}$$

where H is the maximum elevation of the topography (see figure 1), $z_{\text{topo}}(x)$ is the local elevation of the topography at a horizontal coordinate x, $\alpha(x)$ is the local slope angle, and c is an empirical constant, which they estimate between 3.5 and 4.0. The predictions of equation 2 are compared to our analysis in section 2 below. A significant limitation of equation 2 is that it is intended to only provide predictions at a fixed altitude of $H/8$ above the slope, and cannot be used at other altitudes.

1.3 Effect of introducing horizontal sections (benches) in the topographic profile

Introducing a horizontal segment (a "bench") on the topography has two main effects. First, if the highest elevation of the topography is shifted downstream, the average slope angle will be effectively reduced. This will reduce the vertical velocity. Second, the bench may introduce turbulence, which is associated with flow separation and unsteadiness that occurs at the front of the bench, where the topography rapidly curves away from the incoming flow (figure 1). For small benches, a local region of recirculating flow may form, with the outer airflow effectively 'skipping' over the bench, and continuing to follow the topography at a higher elevation.

The only formal study of the effect of a significant bench appears to be the wind tunnel experiment of Zheng et al. (2018), who examined the effect of a large bench (of horizontal extent H/2) on a 1:1 slope. They measured flow velocities and turbulence at an altitude of $0.2H$ from the surface and above. Zheng et al. (2018) found that the bench had a negligible effect on flow amplification near the top of the topography. The turbulence generated over the bench followed the surface of the topography; for an altitude of more than $0.5H$ above the surface, there was no measurable increase in turbulence intensity. At $0.2H$ above the surface, a small increase in turbulence intensity was found, corresponding to an increase of approximately 4% in gust velocity. An increase in turbulence intensity was found close to the top surface of the topography (consistently with the sketch shown earlier in figure 1).

Although Zheng et al. (2018) appear to provide the only targeted investigation of the effect of benches, several studies have examined complex, realistic topographies featuring irregularities (e.g. Cuerva-Tejero et al., 2018; Glanville and Kwok, 1997); a common finding is that the turbulence generated over the surface does not significantly affect the outer flow on the front of the topography.

1.4 Connection to literature on soaring

As already noted above, the findings from the scientific and engineering literature are consistent with the qualitative discussions found in the soaring literature. Two key references are Pagen's books "The Art of Paragliding" and "Understanding the Sky" (Pagen, 1992, 2001). The regions highlighted in figure 1 match those discussed for example in figures 13-3, 13-6, 13-11, 13-12 and 13-13 of Pagen (2001). The region of strongest vertical velocity in figure 1 corresponds to the "soarable envelope", whereas the region of maximum velocity corresponds to Pagen's "Venturi area". In addition, figures 105, 106 and 115 of Pagen (1992) indicate that airflow above the slope can be largely unaffected by turbulence produced on the slope surface, consistently with the measurements summarized in the previous section.

2 Analysis

As noted earlier, theoretical models that attempt to describe the complete flow can be inaccurate for steep topographies. Civil engineering codes provide semi-empirical formulas for horizontal wind velocity, but do not appear to consider vertical wind velocities. For this reason, the analysis

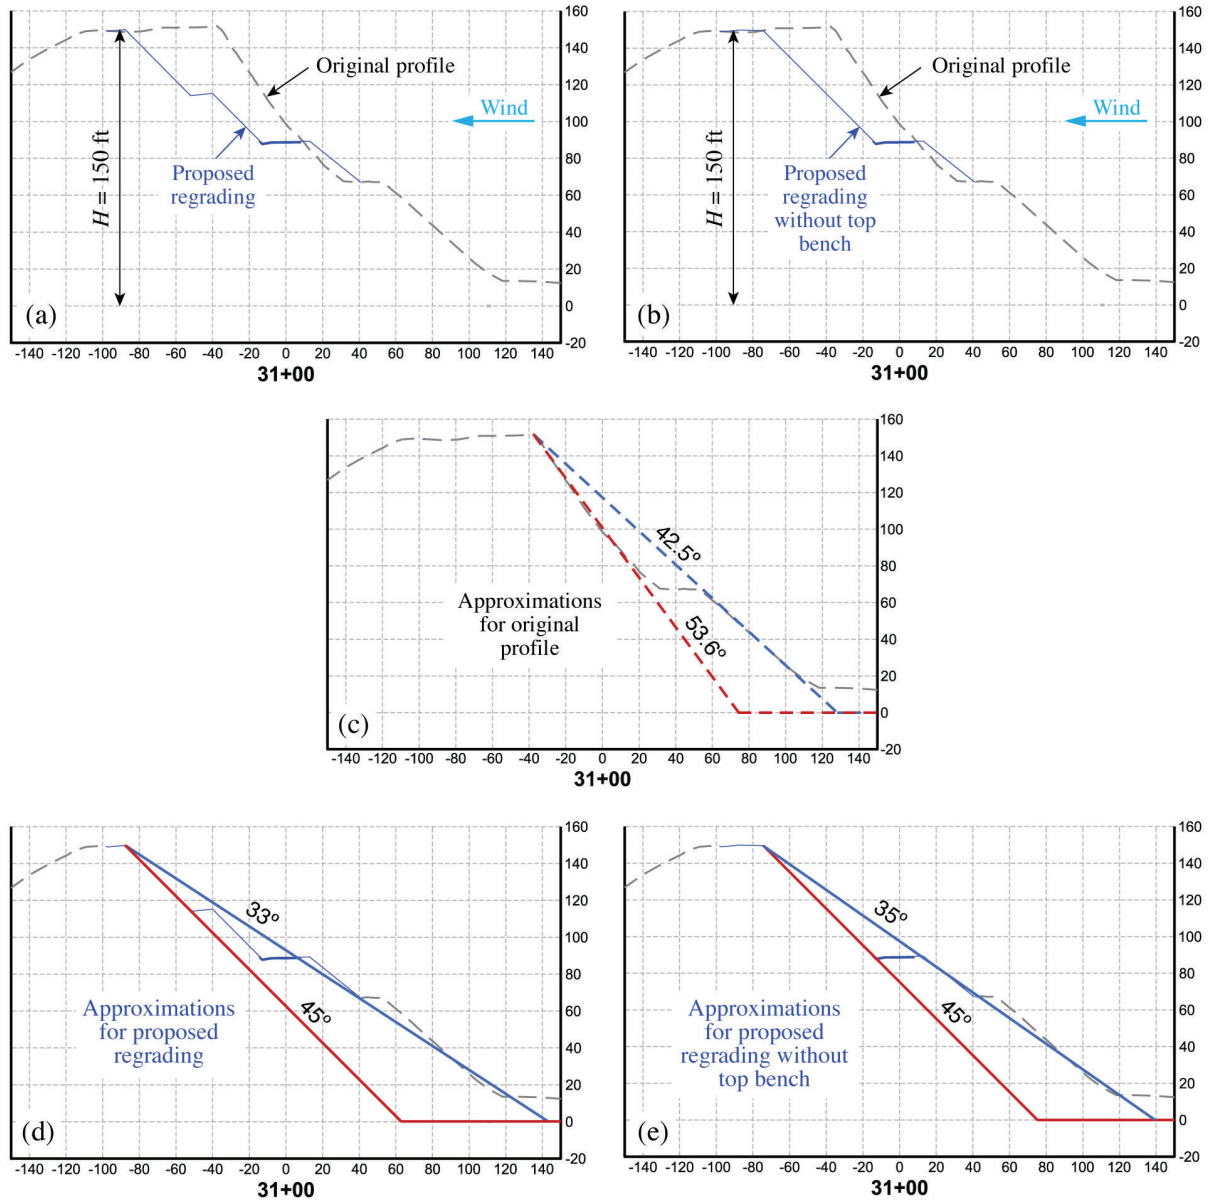

Figure 2: (a): comparison of original bluff profile and proposed regrading. (b): proposed regrading without top bench. (c) Approximations to the original profile, based on mean slope (blue) and near-top slope (red). (d): approximations for proposed regrading, and (e) approximations for proposed regrading without top bench.

presented here employs several semi-empirical approaches, relying also on the well-established data set of Bowen and Lindley (1977), who measured flow over topographies with different slope angles.

2.1 Approximate representations of the topography

The analysis is based on a representative two-dimensional section of the Rincon bluffs, shown in figure 2(a). To approximate the topography, two approaches are used and compared. The first approximation defines a mean slope, which joins the foot of the bluffs (where the topography rapidly departs from horizontal) to the top of the topography; this approach is consistent with

approximations used in the academic literature (e.g. Jensen, 1983), and is expected to approximate the airflow at an altitude larger than the lengthscale of the benches. This mean slope is shown by the blue lines in figure 2(c,d). The second approximation uses a slope based on the bluff shape near the top, where the maximum air velocity is expected. This approximation may be more representative of local flow conditions experienced very close to the ridge, and is shown by the red lines in figure 2(c,d). Quantities referring to the original bluffs and to the proposed regrading are represented using dashed and continuous lines, respectively. The slope angles associated with each approximation are shown in the figure.

An alternative proposed regrading was also considered, which essentially removed the bench closest to the top of the topography. This is sketched in figure 2(b,e), and only implies a change in the mean slope.

The analysis does not consider other effects, such as changes in vegetation patterns, and addition or removal of other structures. As noted earlier, the incoming wind direction is assumed perpendicular to the bluffs. A neutrally stratified atmosphere is assumed.

2.2 Wind amplification

To estimate wind amplification, the data of Bowen and Lindley (1977) for the wind amplification factor A_z are digitized. The quantity A_z is defined as the ratio between the wind speed measured at a point over the topography and the wind speed found upstream of the topography, at the same altitude (for example, a point 30 ft above the bluff is compared to an upstream point that is 30 ft above the ocean surface). Figure 3 shows maps of A_z for topographies ranging from a 2:1 slope to a vertical cliff. Lengths are normalized by the maximum elevation H of the topography. These maps of wind amplification are used to calculate vertical wind velocity in the next section.

2.3 Vertical wind velocity

To obtain a first estimate of the change in vertical velocity due to the regrading, we note that the wind amplification at a given elevation is not expected to change significantly after the regrading, since the mean slope remains significantly steeper than 2:1. Noting that the vertical velocity near the surface will be equal to the wind magnitude times $\sin(\alpha)$, the ratio of the vertical velocities before and after the regrading may be approximated as

$$\frac{V_w|_{\text{regrading}}}{V_w|_{\text{original}}} = \frac{\sin(\alpha_{\text{regrading}})}{\sin(\alpha_{\text{original}})}. \tag{3}$$

This expression can also be obtained from equation 2 (due to Crawley and Schmanske, 1994), as long as one compares slope locations with the same elevation. Using the slopes in figure 2, equation 3 implies a reduction in V_z between 12% and 20% for the proposed regrading, and a reduction between 12% and 15% for the regrading without the top bench. This simple prediction is expected to be reasonable at an altitude that is small compared to H (say, around $0.1\,H$, corresponding to approximately 15 ft).

To obtain an estimate of the change in V_z at greater altitudes, we return to the data set of Bowen and Lindley (1977). As noted in section 1, Bowen and Lindley (1977) did not measure vertical velocities; for this reason, we deduce the vertical velocity V_z from the horizontal velocity V_x over the topography, which is calculated from A_z. Since the time-averaged flow is exclusively in the $x-z$ plane, mass conservation implies $\frac{\partial V_x}{\partial x} + \frac{\partial V_z}{\partial z} = 0$ (e.g. Batchelor, 2000). We calculate $\frac{\partial V_x}{\partial x}$ and integrate the equation for mass conservation to find $V_z(z) = V_z(z_1) - \int_{z_1}^{z} \frac{\partial V_x}{\partial x}\, dz$, where z_1 is an

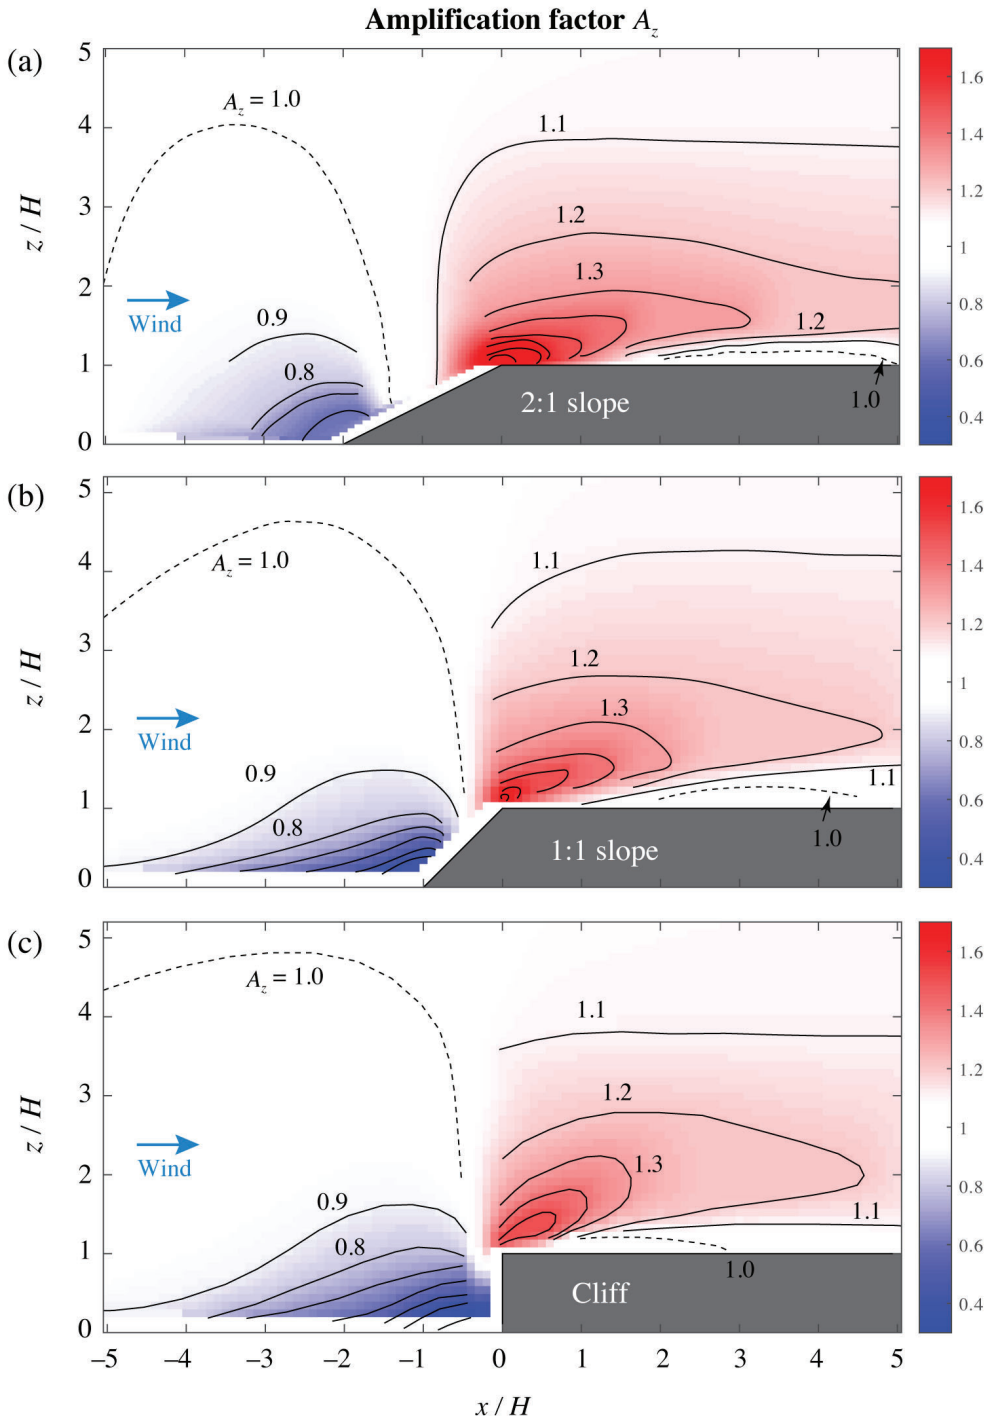

Figure 3: Acceleration of flow over slopes of varying steepness, for a given altitude, expressed by the amplification factor A_z, such that $A_z > 1$ represents accelerated flow relative to the undisturbed conditions upstream. Contours are shown at intervals of 0.1. The $A_z = 1.0$ contours are shown by dotted lines. Each panel shows: (a) 2:1 slope, (b) 1:1 slope, and (c) a vertical bluff. Data adapted from the wind tunnel experiments of Bowen and Lindley (1977).

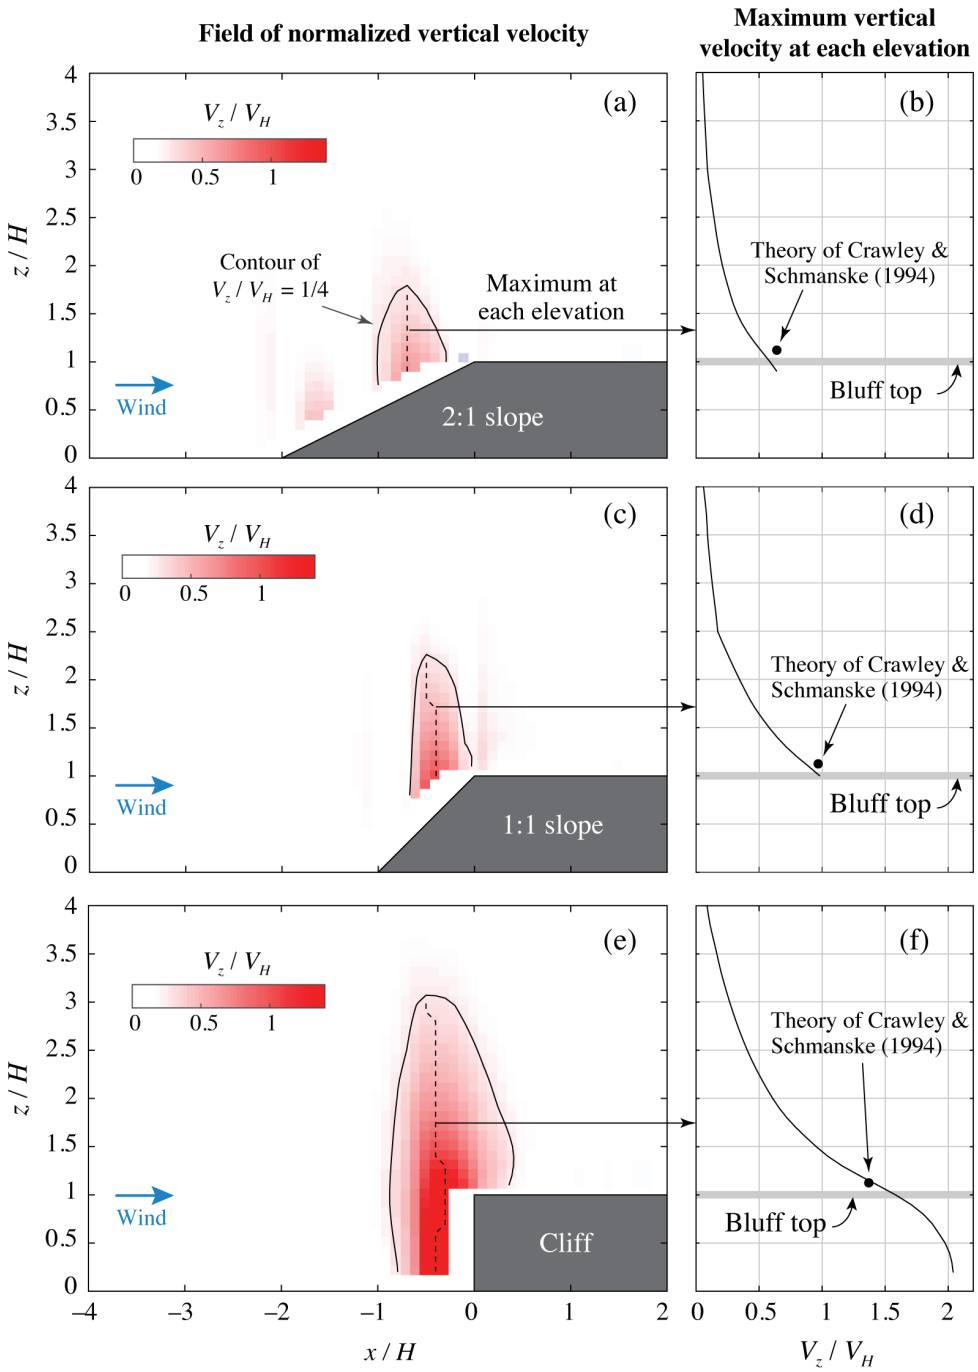

Figure 4: Vertical wind velocities over slopes of varying steepness, deduced from the wind tunnel experiments of Bowen and Lindley (1977). The theory of Crawley and Schmanske (1994) (corresponding to equation 2, valid only for $z/H = 1.125$) is shown for comparison.

elevation at which $V_z(z_1)$ is known; we take $z_1 = 5.5H$, where the vertical flow is small compared to the vertical velocities induced near the topography, such that $V_z(z_1) \simeq 0$.

The calculated vertical velocities V_z for each of the experiments of Bowen and Lindley (1977) are shown in figure 4. The left-hand panels show fields of vertical velocity over each topography, normalized by V_H, which is the wind velocity of the upstream flow at an elevation $z = H$ (se

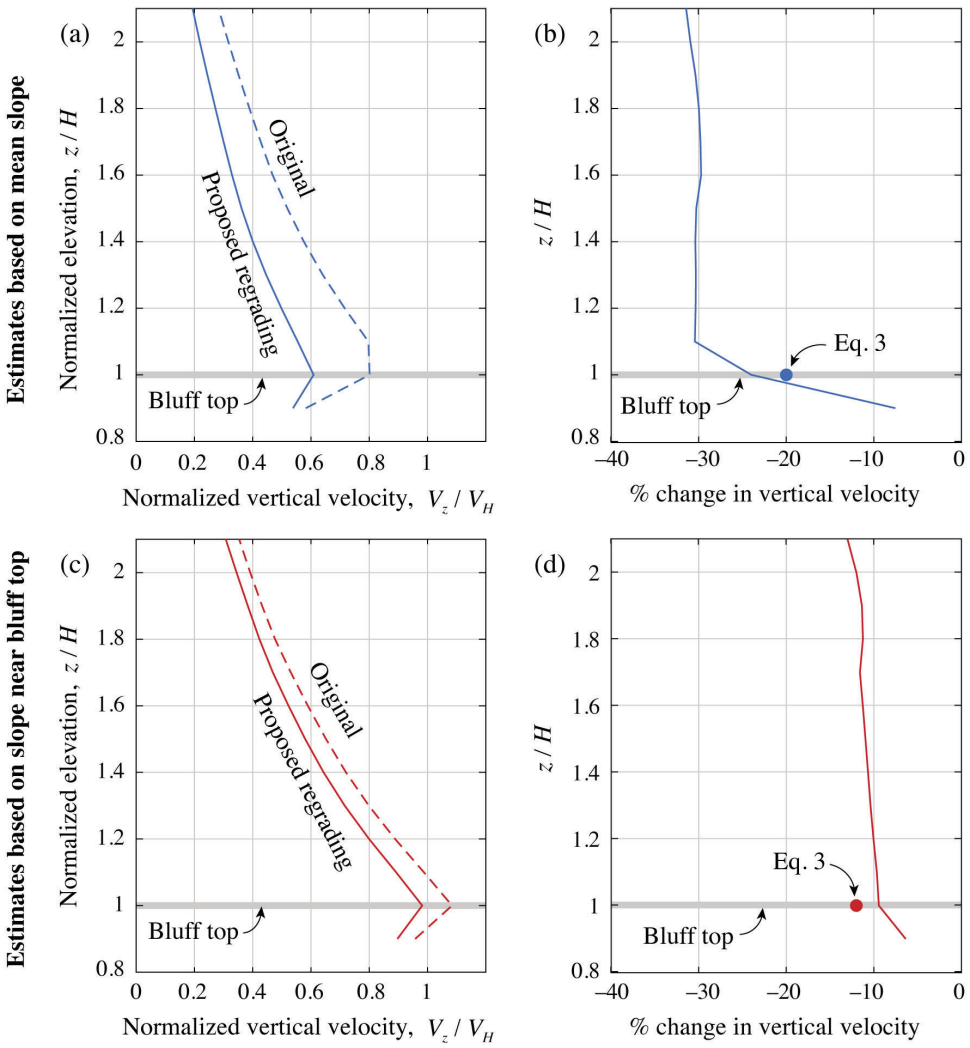

Figure 5: Change in vertical velocity associated with the proposed regrading. (a) and (c) show estimated vertical velocities, whereas (b) and (d) show percentage changes. The top two panels (a) and (b) use the mean slope, whereas the bottom two panels (c) and (d) use the maximum slope near the bluff top. The circles in (b) and (d) show the prediction of the simple approximation in equation 3, which is valid close to the slope surface.

figure 1). The contour corresponding to the arbitrary value $V_z = V_H/4$ is drawn to convey the extent of the region where uplift is experienced (uplift is experienced also outside of this region, although with lower intensity). Within this contour, the line showing the x-location of highest vertical velocity at each z is shown by by a dashed line. The vertical velocity along this line is plotted in the right-hand panels. As a check on our calculation, we compared our calculated V_z for the 2:1 slope with the wind tunnel data of Liu et al. (2016), who measured V_z at selected locations over a similar topography, finding consistent predictions. We also compare our results with the theory of Crawley and Schmanske (1994), which predicts V_z only at an altitude of $H/8$ above the slope, finding good agreement for this altitude, as shown in the right-hand panels of figure 4.

To predict V_z for the slopes relevant to the Rincon bluffs, we interpolate the horizontal velocities of Bowen and Lindley (1977) with respect to slope angle, thereby obtaining approximate horizontal velocities for the slopes shown earlier in figure 2. We then use the same approach described above to

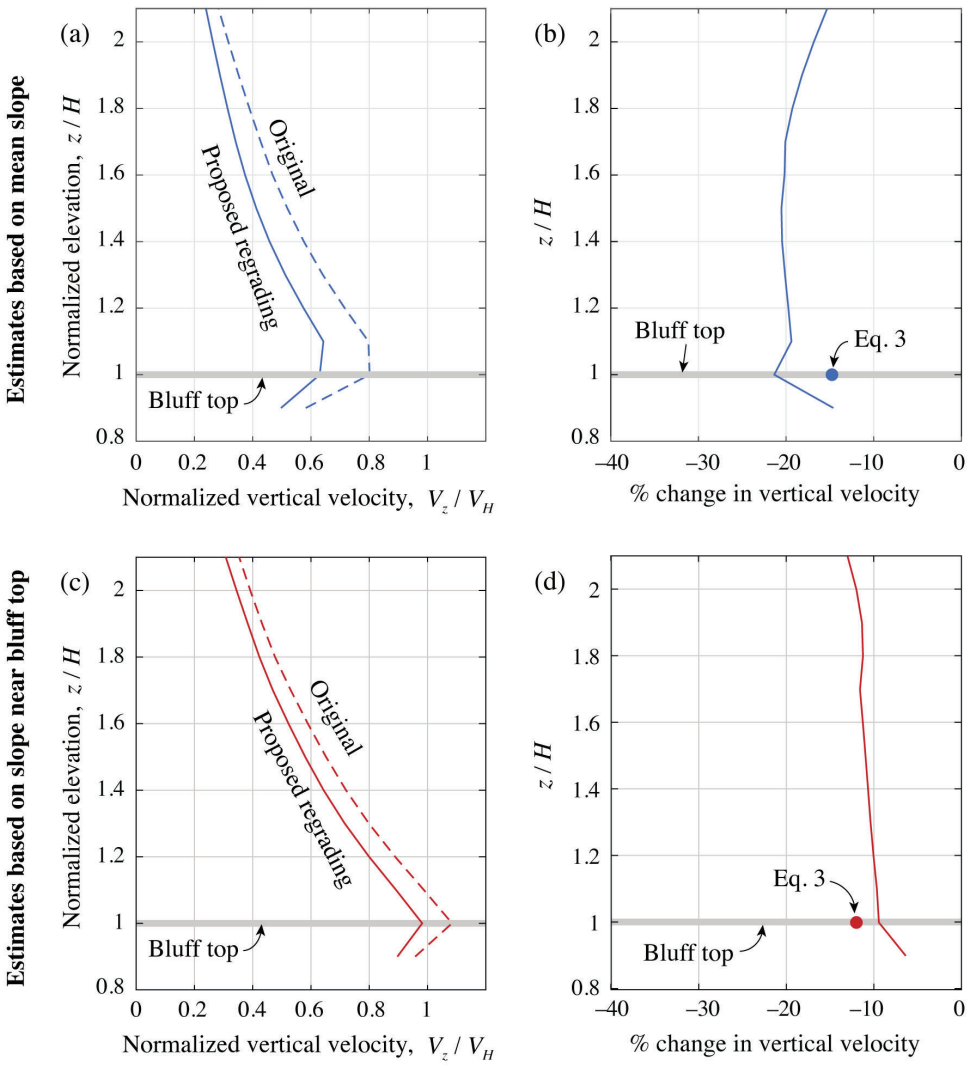

Figure 6: Change in vertical velocity associated with the proposed regrading, for the case involving one fewer bench near the bluff top. (a) and (c) show estimated vertical velocities, whereas (b) and (d) show percentage changes. The top two panels (a) and (b) use the mean slope, whereas the bottom two panels (c) and (d) use the maximum slope near the bluff top. The circles in (b) and (d) show the prediction of the simple approximation in equation 3, which is valid close to the slope surface.

deduce vertical velocities V_z. The maximum vertical velocities at each z are shown in the left-hand panels of figure 5, for both the original bluff and the proposed regrading. The right-hand panels show the percentage change at each z. The analysis based on the mean slope predicts that the vertical velocity will be reduced by approximately 30%, whereas the analysis based on the near-top slope predicts a reduction of around 10%. Panels (b) and (d) also show the simple prediction from equation 3; since this result is valid only close to the slope surface, we display it using circles placed at the bluff top.

For the regrading that involves one fewer bench, the mean slope increases relative to the initially proposed regrading, which brings the predicted reduction in V_z to around 20%, as shown in panel (d) of figure 6. For completeness, predictions for the near-top slope analysis are also reported, although they are the same as in figure 5.

2.4 Effect of introducing horizontal sections (benches) in the topographic profile

As discussed earlier in section 1.3, the introduction of a bench through regrading implies a reduction in the mean slope, and therefore a reduction in vertical velocity; this effect is already accounted for in the mean-slope analysis in section 2.3. To estimate the additional turbulence introduced by the bench, we refer to the wind-tunnel study of Zheng et al. (2018); accoordingly, one may expect that introducing a bench would result in increase in turbulence of the order of 5% at an altitude of around $0.2\,H$ above the topography, corresponding to an altitude of approximately 30 ft above the Rincon bluffs. Based on the data of Zheng et al. (2018), this additional turbulence is expected to become negligible by an altitude of $0.5\,H$ above the topography, corresponding to approximately 75 ft above the Rincon bluffs. Turbulence on the top surface of the bluffs (in the high-turbulence region highlighted in figure 1) is likely to be increased more significantly.

3 Conclusions

Based on a review of the scientific, engineering and soaring literature, the change in vertical airflow associated with a proposed regrading of the Rincon bluffs has been estimated. The approach used simplified slope profiles, together with a re-analysis of published experimental data for slopes of various angles. It is estimated that the proposed regrading would reduce the vertical airflow velocity by 10% to 30% relative to current conditions; for altitudes relevant to soaring activities, the reduction is expected to be closer to 30%. An alternative proposed regrading, involving one fewer bench near the bluff top, would reduce the airflow velocity by 10% to 20%. Based on available experimental results, the introduction of a bench is expected to provide a small increase in turbulence (of the order of 5%) at an altitude of 30 ft above the front of the bluffs, becoming negligible by an altitude of approximately 75 ft.

Disclaimer

The aerodynamics of wind over complex topography are the subject of ongoing research, and no standard engineering approach exists for the calculations reported here. While every effort has been made to ensure accuracy of the predictions, within the constraints associated with the assumptions and methodologies used, no warranties are made or implied with regards to the predictions obtained from this study.

Transportation Memorandum

February 18, 2021

John Ilasin, Public Works Director/City Engineer
City of Carpinteria
Public Works Department
5775 Carpinteria Avenue
Carpinteria, CA 93013

Re: Evaluation of Rincon Multi-Use Trail Preliminary Design

Dear Mr. Ilasin,

I have completed my review of the Rincon Multi-Use Trail Project plans. The City asked that I review the preliminary plans with regards to potential conflicts between the trail termini and adjacent roadway or parking areas. I reviewed sheets 10, 21, and 37-39 that show layout, signage, and delineation. My comments are as follows:

1. The termination of the trailhead at the Rincon Park parking area cul-de-sac does not appear to be a conflict between bicyclists and motorists. This is a slow speed and mixed vehicle environment, and the vehicle types should mix safely. Many State and County parks along the coast have this type of interaction (i.e. Refugio State Beach).

2. I have a concern about a driver of a motor vehicle believing they can drive on the trail from the parking lot since the entrance to the trail is fairly wide. Although there is going to be a “No Motor Vehicles” sign I would recommend adding a 4’ edgeline around the cul-de-sac to help deter movement onto the trail.

3. The project should consider installing guide signs that indicates where the trail goes or what the name of the trail is for improved user experience. This is extremely helpful for out-of-town tourists.

4. There are more striping details on the detail sheet than the delineation plan such as the hatching, stop legend, and stop bar. These should be added to the delineation plans so the contractor has installation notes and it is clear what they are bidding on and installing.

5. There may end up being a parking issue with the other end of the trail at Carpinteria Ave. Because the trail comes out near the intersection with Hwy 150, there is no place for trail users to park and get directly to the trail. Consider moving the terminus of the trail so that it connects at the cul-de-sac. This would provide more parking for trail users.

Let me know if you have any questions.

Sincerely,

Thomas Mericle, PE, TE

County Connector Trail Proposal – Rincon Park Project Components Study

November 19, 2020

County Connector Trail Proposal – Rincon Park Project Components Study:

County of Santa Barbara, California

To Whom It May Concern,

Bengal Engineering is pleased to present this proposal to provide component feasibility associated with the County Connector Trail – Rincon Park Project.

The trail is proposed to run through/near Rincon Park, to the existing Bike Path at Bates Road and Highway 101. We understand a safe route through the County's Rincon Park is of importance. We also understand the engineering challenges involved in investigating the design.

The attached project scope was developed based on discussions during meetings held on 29 September, 1 October, and 5 November with County and SBCAG officials.

Regards,

Scott Onishuk, P.E.

Bengal Engineering

Scope of Work:

Project Administration

This item provides budget for Bengal's internal project administration along with some effort to coordinate with others.

Project Components:

Bengal will investigate project components and determine their feasibility – Components are broken up into West-End and East-End components.

Exhibit 1: various alignments to be studied

West-End Components

This is a new option, based on November 5 meeting:

Project will investigate using 2 trail connections simultaneously—for two different types of users:

1. "Yellow line" trail on ocean side of parking lot for recreational users stopping at park
2. "Orange line" trail on freeway side of parking lot: for "pass though" users

Components of Ocean Side Recreational User Segment

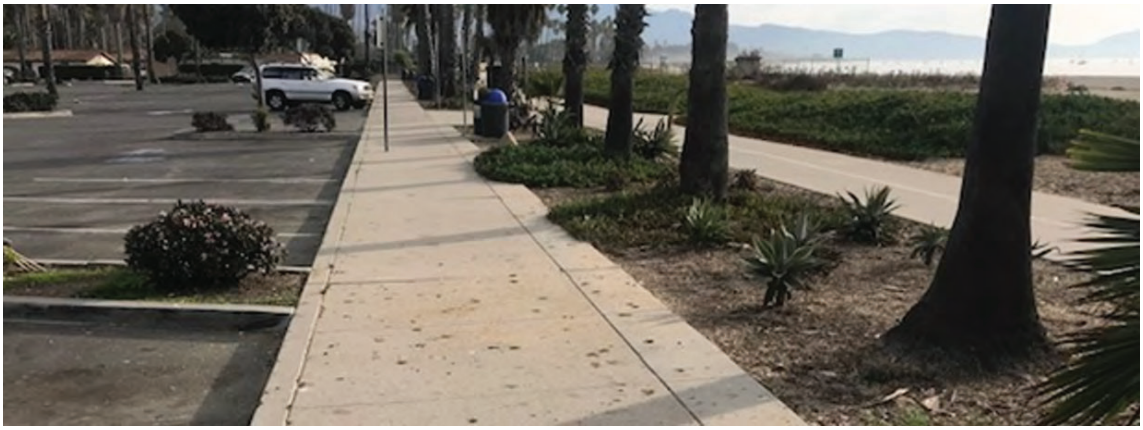

Photo 1: Example provided by Jeff Lindgren: Cabrillo Blvd. Application at Rincon Park would allow recreational users to stop in the park:
Note: sidewalk adjacent to parking lot and separate beach way trail on ocean side of planter

The trail will be 8-feet wide with two 2-foot wide shoulders for a total paved width of 12-feet; this compares to the 16-foot paved width for the rest of the trail to the west. This is a "mixed use path" not a dedicated Class 1 bike path.

On the ocean side of the parked cars, a 5-foot wide sidewalk and a planter strip will separate the mixed-use trail. Because the park is small, the planter strip will likely be narrow: 6 to 8-feet wide is envisioned.

Photo 2: Rincon County Park, looking east from west end of parking lot

Note:

- "yellow line" multi-user path, on a new alignment will replace winding sidewalk in park
- A new raised sidewalk will replace bioswale

Photo 3: Rincon County Park, looking near restroom; note sewer lift station. This area will likely be a "pinch point". Current restroom appears be a potential conflict. Parking may be affected here too.

Photo 4: looking West from Rest Room

Parking Lot Configuration

The project design will preserve parking to the extent possible.

- Preserve head-in parking stall geometry (90-degree stalls): Parking lot will remain generally unchanged to preserve parking spaces and minimize loss of Park space.

- As previously mentioned, behind the cars (on freeway side) separate vehicle drive aisle, between parking lot and trail, using S.B. harbor chain fencing concept.

- Provide new sidewalk adjacent to parking stalls.
- Provide concept to replace the open bioswale and gravel-filled pavers that exist west of the restrooms with current generation permeable pavers or permeable pavement.

Photo 5: "orange line" on freeway side of parking lot: looking east; location of possible "pass-through alignment".

On Freeway side of parking lot, a "pass through" alignment could be provided for users who will not likely stop in the park. Room for this trail will be created by regrading the cut-slope, shifting the toe-of-slope back toward the freeway. Use of a retaining wall to support the cut slope was discussed, but considering 1) the amount of grading which is already required for the project, 2) the opportunity to remove more of the old bridge piers which are buried inside the slope, and 3) the chance to provide a vegetated slope to reduce erosion, the regrading option seems a cheaper and better solution.

This trail will include two 4-foot wide travel lanes, a 2-foot wide paved shoulder on the freeway side and a 3-foot wide paved shoulder on the ocean side (adjacent to the chain-and-post) barrier) for a total paved width of 13-feet.

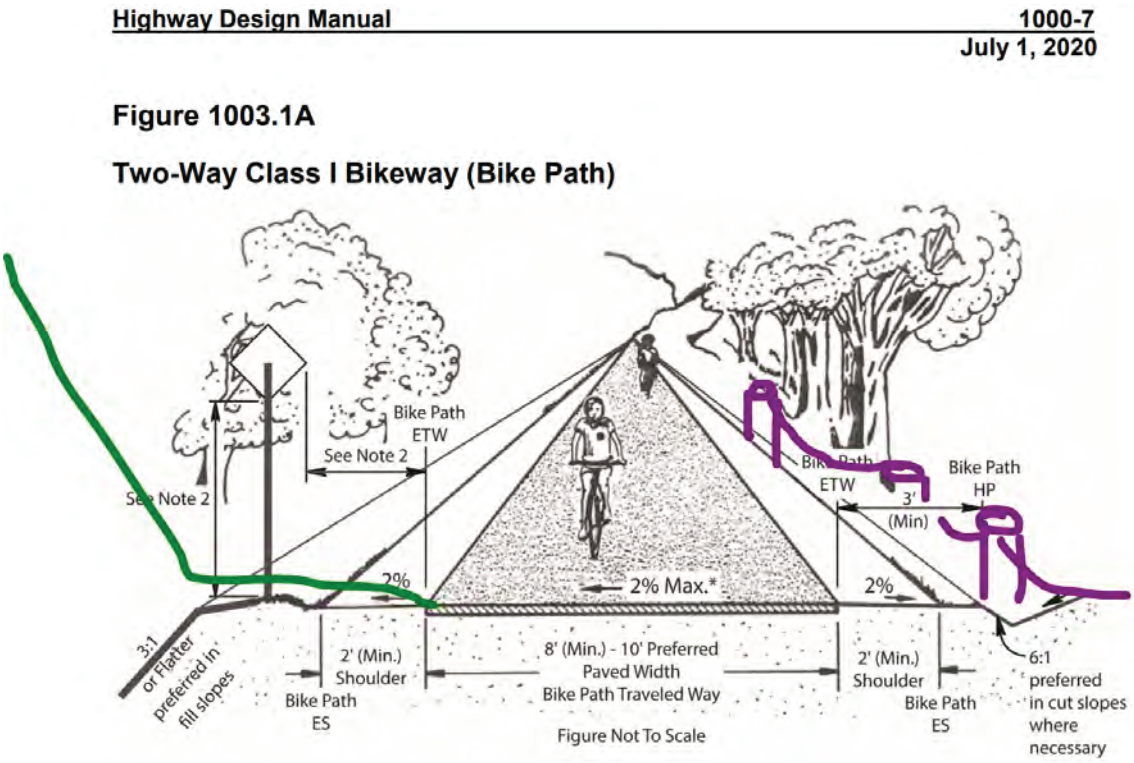

Exhibit 2: Typical Cross section from Caltrans Highway Design Manual with some items of interest for 'Orange Line' alignment.

Photo 6: Santa Barbara Harbor: Chain-and-post barrier concept for use at Rincon County Park

The chain-and-post barrier will require a width on the ocean side of 5-feet (2-feet for the barrier and 3-foot buffer on ocean / traffic side).

Exhibit 1: various alignments to be studied

East-End Components

1. “Pink line” trail, beginning east of sewer lift station, running along southbound off-ramp terminating at Bates Road.

2. “Green line” trail, beginning east of sewer lift station, running outside of the existing parking lot. Trail to terminate at Bates Road.

3. New component, based on 5 November meeting: provide a crossing across the parking lot to the ocean side “yellow line” east of the sewer lift station.

Photo 7: "Green line" alignment will pass along the mountain side of the parking lot

This view is looking easterly

Photo 8: "Green line" alignment looking westerly. Note utility pole and guy wires will be impacted. Sewer lift station is highlighted by yellow circle.

Photo 9: "Pink Line" alignment looking westerly.

Photo 10: Looking easterly from proposed end of "Pink Line" alignment

Deliverable:

1. Draft Project Component Memo - Bengal will provide a summation of the components as noted above. Memo will highlight “pros-and-cons”.
2. Draft Cost Estimates for each alignment
3. Support for a Project Study Workshop – Bengal will create exhibits necessary to present the components for discussion by the project team: Bengal will document the decisions made in the workshop for use in the next item.
4. Using the Project Component Memo and the comments from the workshop, we will create a Preferred Project Component Memo to document the team’s decisions for future use.
5. Updated Cost Estimates: The draft cost estimates provided at the project study workshop will be updated to accommodate the components included in the Preferred Project Component Memo.

Fee:

Bengal Engineering has provided a not-to-exceed budget shown on the attached spreadsheet.

Assumptions/Exclusions:

1. This project will develop planning-level concept plans for future design and consideration provided by the limited budget shown in the Fee Estimate.
2. Because of budget restrictions, we will not be able to include much detail of the areas which will require more engineering effort; specifically the termini of the alignments and the intersection of Bates Road.
3. The concept designs for the alignments will focus on grading, rather than using retaining walls. No walls will be investigated.
4. No subsurface exploration or laboratory testing will be performed.
5. Budget for survey is rough, fill-in topo for planning purposes. This does not include details such as the trees.
6. We assume stakeholders will participate proactively in the project.
7. We assume that the project will proceed uninterrupted.

Planning Commission Action Letter and Adopted Resolution No. PC-22-001

Rincon Trail Project Appeal
19-2015-CUP/CDP
City Council Hearing, March 28, 2022

CITY of CARPINTERIA, CALIFORNIA

January 20, 2022

Matt Roberts, Director
Parks & Recreation Department
City of Carpinteria
5775 Carpinteria Avenue
Carpinteria, CA 93013

Re: Notification of Planning Commission Action
Rincon Trail, 19-2015-CUP/CDP
Eastern Terminus of Carpinteria Ave (APNs 001-220-032, -092, -100, -101)

Dear Mr. Roberts:

On Tuesday, January 18, 2022, the Planning Commission took action on the following item:

> *Request to accept and certify the Environmental Impact Report (EIR) for the Rincon Trail project; select Alternative 3, Steeper Slopes/Reduced Earthwork Alternative, as the preferred project; and grant a Conditional Use Permit and Coastal Development Permit for the 850-foot length segment of the Rincon Trail located in the jurisdiction of the City of Carpinteria.*

The Planning Commission approved the project subject to the Findings and Conditions of Approval as recommended.

This decision to approve the project is appealable to the City Council. The appeal period is ten days commencing on Wednesday, January 19, 2022 and ending on Friday, January 28, 2022 at 5:00 p.m. An appeal must be filed in writing with the City Clerk, and must state specifically in the appeal wherein the decision of the Planning Commission was not in accord with the purposes of Title 14, Zoning, of the Carpinteria Municipal Code, or wherein it is claimed there was an error of discretion by the Planning Commission. No appeal fee is required for projects located within the Coastal Appeals (CA) Overlay.

The project is not subject to the payment of the City's Development Impact Fees as the project does not involve the addition of any new commercial or industrial square footage, or residential units.

A copy of the adopted Resolution, Findings for Approval, and Conditions of Approval for the project are attached to this letter for your records. A separate copy of the last page of the Conditions of Approval is also attached. Please sign and return this page to the Community

Development Department. Should you have any questions or need further information regarding this action letter or the project, please contact Nick Bobroff at (805) 755-4407 or by email at: nickb@ci.carpinteria.ca.us

Sincerely,

Steve Goggia, Director
Community Development Department

Attachment: Planning Commission Resolution with Attachments

cc: John Ilasin, Public Works Director
Fred Luna, SBCAG
City Council
Project file, 19-2015-CUP/CDP

RESOLUTION NO. PC-22-001

A RESOLUTION OF THE CITY OF CARPINTERIA PLANNING COMMISSION TO ADOPT AND CERTIFY THE ENVIRONMENTAL IMPACT REPORT PREPARED FOR THE RINCON TRAIL PROJECT; AND TO APPROVE THE CONDITIONAL USE PERMIT AND COASTAL DEVELOPMENT PERMIT 19-2015-CUP/CDP TO ALLOW THE CONSTRUCTION OF THE 850-FOOT SEGMENT OF THE CLASS I MULTI-USE PATH LOCATED IN THE CITY OF CARPINTERIA. THE ENTIRETY OF THE PROPOSED 2,800-FOOT TRAIL WOULD CONNECT THE EAST END OF CARPINTERIA AVENUE TO RINCON BEACH COUNTY PARK IN UNINCORPORATED SANTA BARBARA COUNTY. THE PROJECT IS LOCATED IN CITY AND CALTRANS RIGHT-OF-WAY AT THE EASTERN END OF THE CITY OF CARPINTERIA.

REQUESTED BY MATT ROBERTS, DIRECTOR, CITY OF CARPINTERIA PARKS & RECREATION DEPARTMENT

WHEREAS, in October 2015, the California Coastal Commission certified City of Carpinteria Local Coastal Plan Amendment (LCPA) LCP-4-CPN-15-0018-1 / City Project 09-1522-LCPA/ORD to establish the Transportation Corridor Wetland Overlay (TCWO) District, which required completion of the Rincon Trail Project as a condition of approval for the Linden Casitas Interchanges and Via Real Extension Project, as a balancing provision to offset unavoidable wetland impacts through completion of one of two regionally important improvements to alternative transportation modes for the purpose of increasing access to coastal resources for all members of the public; and

WHEREAS, the City of Carpinteria Planning Commission previously certified a Mitigated Negative Declaration (MND), and considered and approved a Conditional Use Permit and Coastal Development Permit for an earlier iteration of the Rincon Trail Project in May 2015; and

WHEREAS, in May 2017, the previously granted entitlements for the Rincon Trail project expired due to failure to initiate construction within the allotted two-year timeframe from project approval while construction drawings and specifications were still in development; and

WHEREAS, the City of Carpinteria Planning Commission considered a new application for a Conditional Use Permit and Coastal Development Permit filed by Matt Roberts, City of Carpinteria Parks and Recreation Department, on October 17, 2019 to allow for the construction of a 850-foot segment of the larger 2,800-foot class I multi-use path between the east end of the City of Carpinteria and Rincon Beach County Park in unincorporated Santa Barbara County; and

WHEREAS, the current application was subsequently deemed complete and accepted by the City as being consistent with the applicable submittal requirements on November 15, 2019; and

WHEREAS, the Planning Commission previously accepted and certified a Subsequent Mitigated Negative Declaration (SMND) for the project in January 2020; and

WHEREAS, the acceptance and certification of the SMND by the Planning Commission was appealed to the City Council, and while the appeal was never taken up by the City Council, the Council directed staff in September 2020 to proceed with the preparation of an Environmental Impact Report in order to allow for a more in-depth analysis of key issue areas identified during consideration of the SMND; and

WHEREAS, in response to direction received from the City Council, and in accordance with the California Environmental Quality Act (CEQA), an Environmental Impact Report (EIR) dated December 2021 was prepared for the project and has been noticed and subject to public review as required under CEQA; and

WHEREAS, the Community Development Director has provided public notice of the intent of the Planning Commission, acting on behalf of the City of Carpinteria as Lead Agency, to accept and certify the EIR prepared for the project as having fulfilled all procedural and statutory requirements of CEQA; and

WHEREAS, the Planning Commission has reviewed and considered the EIR, together with any comments received during the public review process; and

WHEREAS, the City of Carpinteria Architectural Review Board considered the proposed project at their October 28, 2021 meeting wherein the project was recommended for preliminary approval; and

WHEREAS, the Planning Commission has conducted a hearing and received evidence regarding the application for the Conditional Use Permit and Coastal Development Permit; and

WHEREAS, the Planning Commission has reviewed the policies of the General Plan/Coastal Land Use Plan and the Zoning Code standards that are relevant to the project.

NOW THEREFORE, THE PLANNING COMMISSION HEREBY RESOLVES AS FOLLOWS:

1. The foregoing recitals are true and correct and are incorporated herein by reference.

2. The EIR prepared for the project is accepted and certified as having satisfied the requirements of CEQA;

3. The Planning Commission has reviewed and considered the EIR, together with any comments received during the public review process;

4. The Planning Commission finds that the EIR reflects the City of Carpinteria's independent judgment and analysis;

5. The Alternative 3, Steeper Slopes/Reduced Earthwork Alternative, has been selected as the preferred project in the EIR;

6. The Conditional Use Permit and Coastal Development Permit are approved, making the Findings for approval outlined in Attachment A; and

7. The Conditional Use Permit and Coastal Development Permit for the project shown in Attachment B are approved subject to the conditions of approval set forth in Attachment C.

PASSED, APPROVED AND ADOPTED this 18th day of January 2022, by the following called vote:

AYES: **COMMISSIONERS:** Allen, Benefield, Moyer

NOES: **COMMISSIONER(S):** Callender

ABSENT: **COMMISSIONER:** La Fevers

Jane Benefield, Chair

ATTEST:

Steve Goggia, Secretary

I hereby certify that the foregoing Resolution was duly and regularly introduced and adopted at a regular meeting of the Planning Commission of the City of Carpinteria held the 18th day of January, 2022

ATTACHMENT A: FINDINGS FOR APPROVAL

PLANNING COMMISSION HEARING
RINCON TRAIL PROJECT
PROJECT 19-2015-CUP/CDP
JANUARY 18, 2022

FINDINGS PURSUANT TO GOVERNMENT CODE, LOCAL COASTAL PLAN, GENERAL PLAN, AND TITLE 14 OF THE CARPINTERIA MUNICIPAL CODE

1.0 Administrative Findings

The Planning Commission hereby incorporates by reference as though set forth in full all Community Development Department staff reports and attachments thereto presented to the Planning Commission and all comments made or received either orally or in writing at the public hearings on this project and the associated Environmental Impact Report.

1.1 Procedures

Pursuant to the California Coastal Act, the Administrative Regulations of the California Coastal Commission and the City of Carpinteria's ("City") Local Coastal Program, it has been found that the process for public review of the subject Local Coastal Development Permit has been properly conducted as follows:

a. An application for a Conditional Use Permit and Coastal Development Permit was submitted on October 17, 2019, and deemed complete and accepted by the City as being consistent with the applicable submittal requirements on November 15, 2019. Said application and all related material have been available for public review at City offices since the date of submittal.

b. The application has been evaluated and found to conform to the applicable zone districts and to be consistent with the City's Coastal Land Use Plan, the Interpretive Guidelines of the California Coastal Commission and the California Coastal Act.

c. The project has been reviewed by the City's Architectural Review Board at a duly noticed public hearing which included, but is not limited to, mailed notice to all property owners within 300 feet of the subject property and residents within 100 feet of the property.

d. The project has been reviewed by the City's Planning Commission at a duly noticed public hearing which included, but is not limited to, mailed notice to all property owners within

300 feet of the subject property, residents within 100 feet of the property and publication in the local newspaper, the Coastal View News.

1.2 California Environmental Quality Act

California Environmental Quality Act ("CEQA") findings pursuant to CEQA (California Public Resources Code Sections 21081, 21081.6) and State CEQA Guidelines (California Code of Regulations Sections 15090, 15091, 15092, 15097):

a. The Environmental Impact Report ("EIR") dated December 2021 was presented to the Planning Commission and all voting members of the Planning Commission have reviewed and considered the EIR prior to approving this project. The EIR reflects the independent judgment of the Planning Commission and is adequate for this proposed project.

b. The Planning Commission finds and certifies that the EIR dated December 2021 constitutes a complete, accurate, adequate and good faith effort at full disclosure under CEQA. The Planning Commission further finds and certifies that the EIR has been completed in compliance with CEQA.

c. The Planning Commission selects Alternative 3, Steeper Slopes/Reduced Earthwork Alternative from among the Proposed Project and Alternatives 1-4 as the preferred project, finding that it meets the project objectives and results in the fewest and least severe impacts to the environment.

d. The documents and other materials which constitute the record of proceeding upon which this decision is based are in the custody of the Planning Commission Secretary located at 5775 Carpinteria Ave, Carpinteria, CA.

e. Adoption of Environmental Reporting and Monitoring Program. The project description, and conditions of approval, with their corresponding permit monitoring requirements, are hereby adopted as the reporting and monitoring program for this project to ensure compliance during project implementation.

f. Pursuant to Section 21081(a) of the Public Resources Code and Section 15091(a)(1) of the State CEQA Guidelines, the Planning Commission finds that design features incorporated as part of the project description and mitigation measures applied as conditions of project approval would result in the avoidance or reduction to insignificant levels the following environmental impacts identified in the EIR. These findings are supported by substantial evidence in the record, including the EIR dated December 2021, and associated appendix materials. The EIR identified the potential for Class II, significant but mitigable impacts in the areas of Aesthetics, Biological Resources, Cultural Resources, Geology and Soils, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Tribal Cultural Resources, and Utilities and Service Systems.

i. Aesthetics: U.S. Highway 101 in the project area is identified as being eligible for scenic highway designation. Additionally, both City and County of Santa Barbara ("County") planning regulations reflect a high concern for protecting visual resources along U.S. Highway 101 in the project area, as well as protecting public views from the project area towards the ocean and mountains. The project would result in visual changes to the area, introducing new human-scale activity from trail users, as well as physical alteration of the area primarily associated with the removal of existing vegetation, earthwork and grading, the construction of the new bridge over the Union Pacific Railroad ("UPRR") crossing, and fencing and barriers along the proposed path alignment. Trail features have been designed to be visually subordinate to the setting, but due to the high scenic value of the area, potentially significant aesthetic impacts may result. Temporary construction activities, such as staging areas and clearing of vegetation, may also degrade the visual quality of the project area.

With the incorporation of the following mitigation measures as project conditions of approval, all impacts would be reduced to a less than significant level. **Measure AES-1** requires the project to be reviewed and approved by both the City Architectural Review Board and the County South Board of Architectural Review to ensure all project elements reflect quality design and are appropriate for their setting. **Measure BIO-5** requires the development and implementation of a Habitat Mitigation and Monitoring Plan, prepared by a qualified biologist, to mitigate for impacts to ESHA vegetation communities. The Plan may include in-kind on-site restoration of impacted areas, and enhancement/restoration of degraded or disturbed areas adjacent to the impacted areas. A total of 4.32 acres of impacts to ESHA vegetation communities will be required to be mitigated at replacement ratios ranging from 2:1 to 4:1, depending upon the habitat types impacted. To the extent feasible, restoration will occur onsite, and any additional mitigation required shall be carried out on areas within adjacent land controlled by the County or City.

ii. Biological Resources: Construction of the trail project would require removal of ESHA vegetation communities that provide potential habitat for two special status species: California legless lizard and San Diego desert woodrat. Construction activities could result in injury or mortality to these special status species, which would be potentially significant absent mitigation.

There are five native vegetation communities found in the project area that are considered to be ESHA by the City, County and California Department of Fish & Wildlife ("CDFW"), and that would suffer permanent impacts as a result of the proposed project: California Brittle Bush – Ashy Buckwheat Scrub Alliance: 0.42 acres; Quailbush Scrub Alliance: 1.73 acres; California Sagebrush – (Purple Sage) Scrub Alliance: 1.29 acres; Coyote Brush Scrub Alliance: 0.71 acres; Lemonade

Berry Scrub Alliance: 0.17 acres. In total, 4.32 acres of ESHA vegetation communities would suffer permanent impacts resulting from the project.

A total of 22 species of native birds were detected on site, including several with the potential to nest there. Nests, eggs, and nestlings of all native birds are protected by the Migratory Bird Treaty Act and the California Fish and Game Code. Vegetation clearing and grading, if occurring during the nesting season, could have the potential to destroy nests, eggs and nestlings, in violation of these regulations. Therefore, impacts to nesting birds are potentially significant.

Potential project impacts associated with biological resources would be addressed through the following mitigation measures: **Measure BIO-1** requires an approved biologist to prepare and implement a worker education and awareness program (WEAP) to educate and make workers aware of sensitive habitats and species that may be encountered in the project area, and to inform workers of required actions that must be implemented to avoid or minimize impacts to sensitive species and habitats. **Measure BIO-2** requires the construction limits to be fenced with highly visible fencing to avoid inadvertent impacts to adjacent areas of ESHA vegetation communities, native vegetation, special-status species and common wildlife species. **Measures BIO-3** and **BIO-4** require pre-construction surveys and relocation efforts for California Legless Lizards and San Diego Woodrats located in the project area, prior to initiation of construction.

Measure BIO-5 requires the development and implementation of a Habitat Mitigation and Monitoring Plan, prepared by a qualified biologist, to mitigate for impacts to ESHA vegetation communities. The Plan may include in-kind on-site restoration of impacted areas, and enhancement/restoration of degraded or disturbed areas adjacent to the impacted areas. A total of 4.32 acres of impacts to ESHA vegetation communities will be required to be mitigated at replacement ratios ranging from 2:1 to 4:1, depending upon the habitat types impacted. To the extent feasible, restoration will occur onsite, and any additional mitigation required shall be carried out on areas within adjacent land controlled by the County or City. **Measure BIO-6** requires a qualified biologist to develop and implement a weed management plan during construction and during implementation of the habitat mitigation and monitoring plan required under Measure BIO-5, to control and prevent the spread of invasive weeds in the project area. **Measure BIO-7** requires a pre-construction nesting bird survey to be completed within 30 days prior to any vegetation clearing, ground disturbance or use of noise-generating equipment that would occur during the nesting/breeding season of native birds potentially nesting in the project area. If active nests are found, then work would be postponed or halted in the affected area until the nest is vacated and juveniles have fledged. With the incorporation of these identified mitigation measures as project conditions of approval, all impacts would be reduced to a less than significant level.

iii. Cultural Resources: Previously recorded cultural resource sites are known to be present in and near the project area. There is the potential for subsurface intact or previously displaced cultural resources to be present and impacted during construction, which could result in a potentially significant effect to cultural resources.

Avoidance and minimization of cultural resource impacts would be addressed through the following measures: **Measure CR-1** requires development of protocols for practical adherence to Measures CR-2 and CR-3 (below), prior to and after ground disturbing construction activities, through the preparation and implementation of a Cultural Resource Treatment and Inadvertent Discovery Plan (CRTP) by a qualified archaeologist. **Measure CR-2** requires all personnel participating in tasks that may incur ground disturbance to be briefed by a qualified archaeologist about the archaeological sensitivity of the site, the types of cultural resources that could be encountered, and the procedures to follow in the event cultural resources or human remains are encountered.

Measure CR-3 requires a qualified archaeologist to be present to monitor initial grading and clearing activities until such time that it is determined that no additional cultural resources are located in the area, and to also monitor the installation of bridge pilings within intact soils and/or any soils deeper than 10 feet below current ground surface to ascertain that no additional cultural resources are present in the improvement area. **Measure CR-4** requires that construction activities be suspended and redirected to another area in the event cultural resources are encountered to allow the monitoring archaeologist to assess the nature, extent and significance of any discoveries and develop appropriate management recommendations for treatment of the discovered cultural resource(s). With the incorporation of the identified mitigation measures as project conditions of approval, all impacts would be reduced to a less than significant level.

iv. Geology and Soils: The project area is located in a geologically active area vulnerable to earthquakes and secondary impacts such as landslides and liquefaction. The project includes features, such as the manufactured slopes and bridge crossing over the UPRR corridor, which could be damaged by seismic ground shaking. The project entails earthwork and grading activities to lay back and stabilize slopes in the project area in an effort to reduce potential erosion effects; nevertheless, erosion impacts could be worsened unless proper slope construction techniques are employed.

Potential project impacts associated with geology and soils would be addressed through the following measures: **Measures GEO-1** and **GEO-2** require the design of the bridge and bridge foundation to adhere to the recommendations contained in the

project-specific geotechnical report. **Measure GEO-3** requires the design and construction of manufactured slopes to also adhere to the recommendations contained within the project-specific geotechnical report. With the incorporation of the identified mitigation measures as project conditions of approval and aspects of the project design, all impacts would be reduced to a less than significant level.

v. Hazards and Hazardous Materials: There is the potential for soils along the project alignment adjacent to the U.S. Highway 101 corridor to contain aerially deposited lead (ADL). Soils containing ADL could be used for fill soils for the project, potentially exposing the public to the contaminated soils. Construction activities and equipment use hydrocarbon fuels and lubricants which are considered hazardous materials. Concrete, paint and other surface coatings are also considered hazardous materials, and are anticipated to be used during construction. Spills or leaks of such materials into the storm drain system could pose potentially significant water quality hazards.

With the incorporation of the following identified mitigation measures as project conditions of approval, all impacts would be reduced to a less than significant level: **Measure HAZ-1** requires surface soils within the project alignment north of the UPRR corridor to be tested for potential ADL presence to determine if such soils meet applicable safety standards and can be used for fill or if standards are exceeded, the soils must be disposed of in a properly licensed landfill. **Measure WAT-2** requires the contractor to prepare and implement a Stormwater Pollution Prevention Plan that includes best management practices to be implemented and monitored prior to and during construction to minimize potential construction-related water quality impacts.

vi. Hydrology and Water Quality: Temporary construction activities may result in inadvertent water quality impacts related to soil, dust, paint and/or concrete entering the stormwater drainage system. There is increased potential for stormwater runoff and erosion during construction and until new/replacement vegetation is established. During the operational phase of the project, soil, trash, dog waste, and other impurities have the potential to enter the project's storm drainage systems and could result in potentially significant water quality impacts. Failure to properly maintain new/replaced storm drain infrastructure associated with the project could result in significant erosion of the bluff face.

Avoidance and minimization of hydrology and water quality impacts would be addressed and mitigated to less than significant levels through the following measures which have been incorporated into the project conditions of approval. **Measure WAT-1** requires the project to obtain and maintain coverage under a Construction General Permit from the State Water Resources Control Board. **Measure WAT-2** requires the contractor to prepare and implement a Stormwater

Pollution Prevention Plan that includes best management practices to be implemented and monitored prior to and during construction to minimize potential construction-related water quality impacts. **Measure WAT-3** requires implementation of an Erosion and Sediment Control Plan utilizing best management practices throughout grading and construction activities.

Measure WAT-4 requires replanting of native vegetation and hydroseeding of slope areas with appropriate native seed mixes as soon as practicable following completion of trail construction, in order to provide long-term stabilization of soils disturbed during construction. **Measure WAT-5** requires ongoing periodic inspection and maintenance/repairs of all new and replaced storm water components on an annual basis prior to the start of the rainy season, to ensure all components are in good repair and not blocked by debris or sediment. **Measure WAT-6** requires all project area storm drain inlets to be outfitted with storm drain filters/inserts to minimize pollutants from impacting the ocean. Filters shall be cleaned at least twice a year, once immediately prior to November 1 (start of the rainy season) and once in January.

vii. Land Use and Planning: The City of Carpinteria's and County of Santa Barbara's respective Local Coastal Programs contain a number of policies and regulations concerning resource protection within the Coastal Zone. Project impacts to these resources could result in potentially significant land use and planning impacts unless properly mitigated. Incorporation of all of the mitigation measures identified in the EIR would reduce environmental impacts to less than significant levels, such that the proposed project would not conflict with any applicable land use plan, policy or regulation of an agency with jurisdiction over the project.

viii. Noise: Short-term, temporary noise impacts would occur during construction. Residences closest to the project site (i.e., residences located in the Rincon Point neighborhood) are the only sensitive receptors in the project area and could periodically be exposed to potentially significant noise impacts if not properly mitigated. Construction-related traffic, such as haul trucks, which may pass by the sensitive receptors causing intermittent noise impacts.

Avoidance and minimization of noise impacts would be addressed through the following measures which have been incorporated into the project conditions of approval. **Measure NOI-1** would limit construction hours for the project to the hours between 8:00 a.m. and 5:00 p.m., Monday through Friday. No construction is permitted to occur on weekends or state holidays. Construction maintenance shall be limited to the same hours. Non-noise generating construction activities would be exempt from these restrictions. **Measure NOI-2** requires all construction equipment with engines to have original manufacturer's approved muffling devices, and all stationary equipment be physically buffered from nearby sensitive receptors.

ix. Tribal Cultural Resources: No known tribal cultural resources listed in the California Register of Historical Resources or in a local register of historical resources are known to be present within the project site. Nevertheless, given the known presence of sensitive archaeological resources in the general vicinity, there is potential for unknown subsurface tribal cultural resources to be present and to be impacted during construction, resulting in potentially significant impacts to tribal cultural resources.

Measure TCR-1 requires initial ground disturbing activities to be monitored by a Native American observer. The monitor/observer shall immediately inform equipment operators in the event archaeological resources are encountered, and shall be empowered to immediately halt construction activity in the area of the discovery until assessment can be completed and materials recovered, as appropriate. Measure TCR-1 in coordination with **Measures CR-1** through **CR-4**, previously described above, would reduce potentially significant impacts to unknown tribal cultural resources to a less than significant level, and have been incorporated into the project conditions of approval.

x. Utilities and Service Systems: The project would moderately alter existing drainage patterns in the project area through re-grading of project slopes, short-term removal of vegetation, and introduction of the new impervious trail surface (approximately one acre of new impervious surface), resulting in potentially significant impacts to water quality. New storm drainage infrastructure associated with the project could pose potentially significant erosion impacts if not properly maintained to avoid failure of said infrastructure. Previously identified **Measures WAT-1** through **WAT-5** would address and reduce potentially significant temporary construction-related water quality impacts and storm drainage infrastructure impacts to less than significant levels, and have been incorporated into the project conditions of approval.

1.3 Conditional Use Permit Findings

Pursuant to Carpinteria Municipal Code §14.62.040(8), the Planning Commission shall determine that all of the following criteria have been met prior to approving or approving with conditions a Conditional Use Permit:

a. *The site for the proposed use is adequate in size and shape to accommodate the use.*

The portion of the Rincon Trail project located in the jurisdiction of the City of Carpinteria would fit entirely within the existing Caltrans right-of-way for U.S. Highway 101 and City of Carpinteria right-of-way near the eastern terminus of Carpinteria Avenue. A portion of the Caltrans right-of-way located just east of the City-County boundary would be dedicated and transferred to the City of Carpinteria as part of the project in order to facilitate the City's ongoing ownership and responsibility for this portion of the trail. A temporary construction

easement may need to be acquired from the property owner of the easternmost parcel on Carpinteria Avenue (APN 001-210-016) to facilitate access to, and construction of the new trail alignment. The western trailhead would be located in an existing unimproved shoulder of Carpinteria Avenue, adjacent to the Rincon Road/State Highway 150 intersection. Informal trailhead parking would be available via on-street parallel parking near the cul-de-sac at the end of Carpinteria Avenue and in the remaining portion of the unimproved shoulder.

Use of off-site areas for mitigation of projected permanent biological resources impacts is anticipated to be necessary to meet specified regulatory replacement ratios for loss of sensitive vegetation communities along the trail alignment. The adjacent Rincon Bluffs Preserve and natural areas of the Rincon Beach County Park have been preliminarily identified as the preferred receiver site for offsite compensatory mitigation for native vegetation impacts that cannot be accommodated onsite due to site area constraints. Final site selections for any proposed offsite compensatory mitigation efforts will be included in the required Habitat Mitigation and Monitoring Plan for the project.

b. *The site for the proposed use is served by streets and highways that are properly designed to carry the type and quantity of traffic generated by the subject use.*

This project is designed to improve bicycle and pedestrian travel by providing a dedicated class-I direct coastal route between the eastern terminus of Carpinteria Avenue in the City of Carpinteria and public recreational facilities located southeast of the City in unincorporated Santa Barbara and Ventura Counties (i.e., Rincon Beach County Park; Rincon Point State Beach; and Pacific Coast Bikeway). The project would provide a safer and legal alternative to the current use of the U.S. Highway 101 shoulder and/or informal trails that trespass through the UPRR corridor to connect the City of Carpinteria to points southward for cyclists and pedestrians. The trail project would fill in this existing gap in the California Coastal Trail ("CCT"), consistent with the circulation and bikeway systems outlined in the County of Santa Barbara's Comprehensive Plan, the City of Carpinteria's General Plan/Coastal Land Use Plan, the statewide CCT Map, and the Plan for Improved Agency Partnering (Caltrans and California Coastal Commission, 2016). The project would enhance and improve coastal access and alternative transportation opportunities for bicycles and pedestrians, consistent with local coastal policies and plans.

The project would have no long-term substantive impact on the capacity of roadways in the project area. Completion of the bike path is anticipated to result in an incremental reduction of vehicle trips to access nearby popular coastal destinations. Existing roadways and public parking areas at the trail ends have sufficient capacity to serve any trail-related vehicle traffic.

Temporary construction-related traffic has been estimated in the project EIR and found to be less than significant. Haul trucks used to export cut from the project site on the City's

portion of the trail would utilize US Highway 101 and the State Highway 150 interchange to access the site. The EIR estimates up to three haul truck trips per hour over an eight-hour work day during the earthwork phase of construction. Given the low frequency of haul truck trips and immediate proximity of highway access, haul truck trips are not anticipated to result in any significant disruptions to traffic circulation or capacity.

c. *The granting of the permit will not materially adversely affect such necessary community services as sewage disposal, fire protection, water supply, and police protection.*

A copy of the project application and plans were routed to all applicable agencies and special districts for review and comments. All of these agencies have indicated the project would not have adverse effects upon their ability to continue to serve the population of Carpinteria. The project would enhance public coastal access and opportunities for alternative transportation in the Carpinteria area, providing a benefit to the community. The project would not generate wastewater needing treatment, and would not generate a noticeable increase in demand for fire or police protection services. A negligible amount of water would be required during construction and to establish/maintain the new landscape plantings.

The City's portion of the trail project will tie into and be served by existing storm drain infrastructure that serves U.S. Highway 101, which has sufficient capacity to take on the added storm water flows generated by the new impervious surfaces affiliated with the trail project north of the UPRR crossing (estimated at approximately 0.5 acres). Mitigation Measures WAT-1 through WAT-4 address erosion and sedimentation control during construction to avoid water quality impacts and to not damage or overwhelm existing storm drain infrastructure. Mitigation Measure WAT-5 requires ongoing monitoring and upkeep of project-related storm drain infrastructure to avoid failure or damages.

An existing 4-inch sewer force main is located in the project area, near the proposed trail alignment for the section of trail north of the UPRR crossing. The sewer force main would be protected in place during construction. An abandoned underground oil pipeline passes underneath the trail alignment near the western trailhead located in the City of Carpinteria. The pipeline would be protected in place. Other utilities near the project area, but not within the project footprint include a water main line and underground communication lines, neither of which would be impacted by construction of the City's portion of the trail.

d. *The granting of the permit will not be detrimental to the health, safety, and general welfare of the neighborhood.*

The Rincon Trail project establishes a new dedicated public Class I bicycle and pedestrian trail between the City of Carpinteria and recreational amenities (i.e., public beaches, park and bicycle path) located south of the City in unincorporated Santa Barbara and Ventura

Counties. The project results in beneficial recreational, coastal access, and alternative transportation impacts for the region.

The EIR prepared for the project analyzed potentially significant environmental effects associated with the project and identified appropriate mitigation measures to ensure that all impacts were mitigated to a less than significant level. Mitigation measures were identified for the following issue areas: Aesthetics, Biological Resources, Cultural Resources, Geology/Soils, Hazards/Hazardous Materials, Hydrology/Water Quality, Land Use/Planning, Noise, Tribal Cultural Resources, and Utilities/Service Systems. In addition, compliance with Santa Barbara County Air Pollution Control District (APCD) standards is required to ensure that impacts to Air Quality, and Greenhouse Gas Emissions are minimized and remain less than significant. The mitigation measures incorporated into the project via the EIR and the project restrictions imposed via conditions of approval ensure that granting the permit will not be detrimental to the health, safety and welfare of the neighborhoods located nearby to project components.

e. *The proposed use is consistent with the coastal plan, general plans, and applicable specific plan(s).*

As discussed in the General Plan/Coastal Land Use Plan policy analysis section of the Staff Report dated January 18, 2022 and herein incorporated by reference, the project would be consistent with the various applicable policies from the Land Use, Community Design, Circulation, Open Space/Conservation/Recreation, Safety, Noise, and Public Facilities/ Services Elements. The project would fill in an existing gap in the California Coastal Trail (CCT), thereby improving public coastal access and alternative transportation opportunities in the project area. The trail and its design elements have been reviewed by the City's Architectural Review Board ("ARB") for consistency with applicable design policies and found to conform. The project incorporates appropriate mitigation measures, consistent with the requirements of the City's General Plan/Coastal Land Use Plan and Zoning Code to address all unavoidable impacts to ESHA and sensitive species, and other appropriate measures and standards are included to avoid potential impacts related to aesthetics, cultural resources, geology/soils, hazards/hazardous materials, hydrology/water quality, noise, tribal cultural resources, and utilities and service systems, consistent with the policies of the City's General Plan/Coastal Land Use Plan.

f. *The proposed use will not cause substantial environmental damage or substantially and avoidably injure fish or wildlife or their habitat.*

The EIR prepared for the project identified potentially significant impacts on aesthetics, biological resources, cultural resources, geology/soils, hazards/hazardous materials, hydrology/water quality, land use/planning, noise, and utilities/service systems; the EIR also identified standard Santa Barbara County Air Pollution Control District ("APCD") measures that the project is required to implement to ensure impacts to air quality, and greenhouse gas

emissions are minimized and remain less than significant. The EIR contains mitigation measures to reduce all environmental impacts of the proposal to less than significant levels; pertinent mitigation measures from the EIR have been incorporated as conditions of approval.

The project has also been designed to minimize land form modification, and impacts to ESHA, cultural resources and water quality, avoid or reduce exposure to geologic hazards and hazardous materials, avoid disruptions to public utilities, and be aesthetically compatible with the project setting, as required by the resource protection policies of the City's General Plan/Coastal Land Use Plan.

g. *The proposed development will not conflict with recorded easements acquired by the public-at-large for access through or use of the property within the proposed development or any easements granted to any public agency or required as a condition of approval.*

The proposed project would not interfere with any recorded easements acquired by the public-at-large for access through, or use of, the project area. Rather, the proposed project involves the construction of a new public multi-use pathway within existing public right-of-way between the east end of the City of Carpinteria and the unincorporated areas near the Santa Barbara/Ventura County line to facilitate improved public coastal access, recreation and alternative transportation opportunities in the area. In this regard, the project enhances public access along the Carpinteria coastline and between areas located in the City of Carpinteria and those in the unincorporated Rincon Point area.

A portion of the Caltrans right-of-way located just east of the City-County boundary would be dedicated and transferred to the City of Carpinteria as part of the project in order to facilitate the City's ongoing ownership and responsibility for this portion of the trail. A temporary construction easement may need to be acquired from the property owner of the easternmost parcel on Carpinteria Avenue (APN 001-210-016) to facilitate access to, and construction of the new trail alignment. The proposed project is not known to conflict with any easements granted to any public agency. Maintenance access for Caltrans and UPRR through the project area will be maintained/provided, as needed.

h. *Any other conditions which are reasonably necessary to protect the public peace, health, safety, and general welfare.*

Through the environmental review process, a number of mitigation measures have been developed in order to avoid significant impacts to the environment. All mitigation measures identified in the EIR have been included in the conditions of approval and are fully enforceable. Additional project-specific conditions of approval have been included to address traffic management during construction, property owner/neighbor outreach, and ongoing maintenance responsibilities for the trail improvements.

1.4 Coastal Development Permit Finding

Pursuant to the California Coastal Act, the Administrative Regulations of the California Coastal Commission and the City's Local Coastal Program, it has been found that the permit requested may be issued based on the following finding:

a. *The proposed development is in conformity with the City's certified Local Coastal Program.*

The Caltrans right-of-way is designated Transportation Corridor (TC) in the General Plan/Coastal Land Use Plan and is undesignated with respect to zoning. The portion of the project located on Carpinteria Avenue is designed Visitor-serving Commercial (VC) in the General Plan/Coastal Land Use Plan and is zoned Resort District (RES). The proposed use is consistent with the stipulations outlined for these land use designations as the project involves improvements to pedestrian and bicyclist facilities, which are permissible in all land use categories and zoning districts. A Conditional Use Permit and Coastal Development Permit are required for this major transportation facility. The project can meet all of the required findings for approval of the required CUP (discussed above) and CDP. The proposed project is consistent with all applicable policies in the General Plan/Coastal Land Use Plan as discussed in the Planning Commission staff report dated January 18, 2022. The project is also consistent with the Interpretive Guidelines of the California Coastal Commission and the California Coastal Act.

PLANNING COMMISSION HEARING
PROJECT 19-2015-CUP/CDP
JANUARY 18, 2022

ATTACHMENT C: CONDITIONS OF APPROVAL
RINCON TRAIL PROJECT

The Conditions set forth in this permit affect the title and possession of the real property that is the subject of this permit and shall run with the real property or any portion thereof. All the terms, covenants, conditions and restrictions herein imposed shall be binding upon and inure to the benefit of the owner (applicant, developer), his or her heirs, administrators, executors, successors and assigns. Upon any sale, division or lease of real property, all the conditions of this permit shall apply separately to each portion of the real property and the owner (applicant, developer) and/or possessor of any such portion shall succeed to and be bound by the obligations imposed on the owner (applicant, developer) by this permit.

PROJECT DESCRIPTION

1. This Conditional Use Permit and Coastal Development Permit is based upon and limited to compliance with the project description, the hearing exhibits (Exhibit 1, Attachment B to the staff report dated January 18, 2022) and conditions of approval set forth below. Any deviations from the project description, exhibits or conditions must be reviewed and approved by the City for conformity with this approval. Deviations may require approved changes to the permit and/or further environmental review. Deviations without the above described approval will constitute a violation of permit approval.

   The project description is as follows:

   The City of Carpinteria Parks and Recreation Department is seeking approval of a Conditional Use Permit and Coastal Development Permit to construct a 850-foot segment of Class I multi-use path in the City and Caltrans rights-of-way at the eastern end of the City of Carpinteria to allow for a dedicated bike and pedestrian path connection between the City of Carpinteria and Rincon Beach County Park in unincorporated Santa Barbara County. The remainder of the approximately 2,800-foot long trail is located in the jurisdiction of the County of Santa Barbara. The trail is intended to support alternative transportation in the area and fill in a missing link in the 1,200 mile California Coastal Trail.

   The overall project limits would extend from near the Carpinteria Avenue/State Highway 150 intersection to the western terminus of the Rincon Beach County Park parking lot in unincorporated Santa Barbara County. Beginning in the unimproved shoulder just east of the Carpinteria Avenue/State Highway 150 intersection, the trail would trend east/northeast, roughly paralleling the southbound US Highway 101 on-ramp. The trail would be situated on a new bench cut into the existing

manufactured slope above the on-ramp and would gently descend in elevation toward the Union Pacific Railroad (UPRR) corridor where the trail would cross the UPRR corridor using a new pre-fabricated 160-foot long, 14-foot wide clear span bridge. South of the UPRR corridor, the trail would turn due east and gradually descend the face of the ocean-side bluff, terminating at the western terminus of the Rincon Beach County Park parking lot.

The portion of the trail under consideration by the City of Carpinteria Planning Commission extends from Carpinteria Avenue to the eastern City boundary, roughly coincident with the middle of the trail segment north of the UPRR corridor, and measures approximately 850 linear feet. The County of Santa Barbara has permit jurisdiction over the remainder of the trail (approximately 1,950 linear feet), continuing east from the city boundary (and including the new bridge crossing over the UPRR corridor) to the pathway's terminus at the Rincon Beach County Park parking lot.

The proposed concrete multi-use path would feature a five-foot travel lane in each direction, and a paved shoulder width of three feet on each side, for a total path width of 16 feet. A six-foot wide shallow concrete v-ditch would run along the inside of the trail length for the purposes of capturing and conveying stormwater to onsite drainage facilities. Protective fencing would be provided along the trail alignment to keep trail users on the improved path.

Total grading and earthwork quantities for the entirety of the project necessary to cut an Americans with Disability Act (ADA)-compliant trail bench, stabilize slopes, and control stormwater runoff through the project area are estimated at 96,040 cubic yards of cut. Approximately 10,519 cubic yards of the cut material would be used for fill onsite; the remaining 85,521 cubic yards of cut material would be exported offsite. Approximately 45% of the estimated earthwork (equivalent to ~43,200 cubic yards of cut) is expected to occur on the inland side of the UPRR alignment; and the remaining 55% (~52,800 cubic yards) on the ocean side of the UPRR alignment. A storm drain collection system is proposed for the trail alignment, which would utilize a combination of repaired existing and new piped storm drains on the bluff face and drain outlets to the ocean. The portion of the trail located in the jurisdiction of the City of Carpinteria would tie into and be served by existing Caltrans storm drain infrastructure for US Highway 101. A habitat restoration plan is included to restore areas disturbed during construction and to mitigate for permanent removal of vegetation to accommodate the new trail.

As part of the project, the City will obtain an easement from UPRR for the bridge crossing over, and trail improvements within, the UPRR alignment. The City is also anticipating the acquisition of right-of-way from the California Department of Transportation (Caltrans) to accommodate the trail alignment.

The grading, development, use, and maintenance of the property, the size, shape, arrangement, and location of structures, parking areas and landscape areas, and the protection and preservation of resources shall conform to the project description above and the hearing exhibits and conditions of approval below. The property and any portions thereof shall be sold, leased or financed in compliance with this project description and the approved hearing exhibits and conditions of approval hereto. All plans (such as Landscape Plans) must be submitted for review and approval and shall be implemented as approved by the City.

MITIGATION MEASURES FROM THE CERTIFIED PROJECT ENVIRONMENTAL IMPACT REPORT (EIR)

2. **MM-AES-1 Board of Architectural Review.**
The Owner/Applicant shall obtain City Architectural Review Board ("ARB") and County South Board of Architectural Review ("SBAR") approval for project design. All project elements (e.g., design, scale, character, colors, materials, and landscaping) shall be compatible with vicinity development and shall conform in all respects to ARB/SBAR approval.
Plan Requirements and Timing: The Owner/Applicant shall submit architectural drawings of the project including photo renditions from the beach of the storm drains proposed along the bluff face for review and shall obtain final City ARB and County SBAR approval prior to issuance of the zoning clearance. Grading plans, if required, shall be submitted to the City's Planning Department concurrent with or prior to ARB/SBAR plan filing with the Carpinteria Community Development Department or County Planning and Development. ***Monitoring*****:** The Owner/Applicant shall demonstrate to Community Development Department staff and Planning & Development Department compliance monitoring staff that the project has been built consistent with approved ARB/SBAR design and landscape plans prior to Final Building Inspection Clearance.

3. **MM-BIO-1 Workers Environmental Awareness Program (WEAP).**
The Owner/Applicant shall fund an approved biologist to prepare and implement a worker education and awareness program (WEAP) specific to the project. The program shall be presented to all individuals involved in the construction of the project. The program shall include information focused on sensitive vegetation communities, sensitive wildlife and plant species, and common wildlife species and their habitats and shall include, but not be limited to, the following:
    - Description of sensitive vegetation communities.
    - Workers shall be provided with photographs of sensitive biological resources including sensitive wildlife and plant species.
    - Workers shall be informed verbally and in writing of the various project tasks that require biological surveys and monitoring for resource protection.
    - Workers shall be provided with a photograph or description of the markers for active bird nests, trees, or other mitigation areas, so that they shall know these are not to be disturbed without a biological monitor present.

- Workers shall be informed not to litter. All trash and litter shall be picked up and removed from the construction sites at the end of each day.
- Workers shall be informed to obey a speed limit of 15 miles per hour while traveling on the project site to avoid collisions with wildlife.
- Workers shall avoid driving over or otherwise disturbing areas outside the designated construction areas.

Plan Requirements and Timing: The Owner/Applicant shall submit the WEAP to the City of Carpinteria ("City") and County of Santa Barbara ("County") for review and approval prior to zoning clearance approval. All workers, contractors, and visitors shall attend the WEAP prior to entering the project site and performing any work. The Owner/Applicant shall provide copies of the training attendance sheets to City and County staff as a record of compliance with this measure on a monthly basis. The WEAP shall be reviewed and approved by the City and County prior to Zoning Clearance approval. Implementation of the WEAP training shall occur prior to the start of construction and as new crew members are added to the project. ***Monitoring:*** The City and County permit compliance staff will ensure compliance with the WEAP throughout construction by review of attendance sheets and hardhats, inspection of the site, and interviewing workers, as appropriate.

4. **MM-BIO-2 Fencing.**
To prevent inadvertent impacts on adjacent sensitive vegetation communities including County ESH and City ESHA, native vegetation, special-status species, and common wildlife species and their habitats, construction limits will be fenced with highly visible fencing and staked. Wildlife safe highly visible construction fencing shall be installed to identify the limits of grading/disturbance, which would reduce potential human trampling outside of the construction limits and minimize the potential spread of non-native weeds or invasive plant species. Wildlife-safe construction fencing and flagging shall remain in place during construction and replaced as needed.
Plan Requirements and Timing: The detailed fencing plan, showing the location of required fencing shall be reviewed and approved by City and County staff prior to Zoning Clearance approval. This condition shall be printed on all project plans. The detailed fencing plan, showing the location of fencing shall be submitted to City and County staff for review and approval prior to Zoning Clearance approval. The fence shall be installed prior to the start of ground disturbing activities. ***Monitoring:*** The City of Carpinteria and County staff will inspect the project plans and site, to ensure compliance with this measure as appropriate.

5. **MM-BIO-3 Pre-construction California Legless Lizard Survey and Relocation.**
Prior to initiation of construction, capture and relocation efforts for California legless lizards shall be conducted. Trapping shall be conducted by a qualified biologist and shall include the following steps:
    i. Prior to initiation of capture and relocation, a suitable receptor site shall be located. This site shall include areas with loose, moist soils occurring in scrub habitat with high coverage of deerweed (*Lotus scoparius*) or

California goldenbush, in arroyo willow (*Salix lasiolepis*) thickets or in other suitable scrub or woodland habitat.

ii. Capture and relocation shall take place no more than five days prior to the initiation of construction.

iii. These surveys shall be performed by lightly raking loose soil, sand and leaf litter with a wooden rake for a sufficient period to determine that no legless lizards are present, or all legless lizards have been captured.

iv. Any lizards found shall be placed in a receptacle with sand and a wet towel and relocated to the previously designated receptor site.

***Plan Requirements and Timing*:** Prior to initiation of construction, capture and relocation efforts for California legless lizards shall be conducted where appropriate. Trapping shall be conducted by a qualified biologist. ***Monitoring*:** The City of Carpinteria and County staff shall ensure the pre-construction survey and relocation efforts, if required, are completed prior to commencement of any earth-moving activities.

6. **MM-BIO-4 Pre-construction Woodrat Survey and Relocation.**
Prior to initiation of construction, capture and relocation efforts for woodrat shall be conducted. Trapping shall be conducted by a qualified biologist and shall include the following steps:

i. Prior to initiation of capture and relocation, a suitable receptor site shall be located. This site shall be within similar habitat and an adequate distance away from any locations that might be subject to increased human disturbance, such as adjacent to a walking path.

ii. These pre-construction surveys shall be performed searching all coastal sage scrub or coastal bluff scrub within the disturbance area for middens or other sign of the species.

iii. Any middens and woodrats found shall be live-trapped and relocated to the pre-determined receptor site. The midden shall be dismantled and the materials placed at the relocation site.

***Plan Requirements and Timing*:** Prior to initiation of construction, capture and relocation efforts for woodrat shall be conducted where appropriate. Trapping shall be conducted by a qualified biologist. ***Monitoring*:** The City of Carpinteria and County staff shall ensure the pre-construction survey and relocation efforts, if required, are completed prior to commencement of any earth-moving activities.

7. **MM-BIO-5 Habitat Mitigation and Monitoring Plan.**
Prior to issuance of zoning clearance approval, the Owner/Applicant shall contract with a qualified biologist to develop a Habitat Mitigation and Monitoring Plan (Plan) to mitigate for impacts to County ESH/City ESHA vegetation communities. The Plan shall outline efforts to restore or enhance coastal sage scrub and coastal bluff scrub communities, and, therefore, preserve or provide wildlife habitat, in areas impacted by construction of the trail but outside the trail-related impervious surfaces and within similar habitats adjacent to the impacted biological resources. The Plan may focus on the following:

- In-kind, on-site restoration of areas where coastal sage scrub or coastal bluff scrub has been removed;
- Enhancement of impacted areas on site currently occupied by ornamental, disturbed or developed areas;
- Restoration of areas occupied by non-native habitats or native habitats with large components of non-native vegetation, within similar habitats adjacent to the impacted biological resources.

A total of 4.32 acres of impacts are proposed to County ESH/City ESHA native vegetation communities. Under the Plan, impacts to S3/County ESH/City ESHA native vegetation communities (California brittle bush – ashy buckwheat scrub alliance, *Encelia californica* association and lemonade berry scrub alliance, *Rhus integrifolia* association) that total 0.59 acres shall be restored in-kind at 4:1. Impacts to S4 and S5/County ESH/City ESHA native vegetation communities (quailbush scrub alliance, *Atriplex lentiformis* association, California sagebrush – (purple sage) scrub alliance, *Artemisia californica* association, and coyote brush scrub alliance, *Baccharis pilularis* association) that total 3.73 acres shall be restored in-kind at 2:1. To the extent feasible, restoration should occur on site and, any additional mitigation required shall be carried out on areas within adjacent land controlled by the County or City, such as the Rincon Bluffs Preserve or Rincon Beach County Park.

A qualified biologist/botanist shall develop the Plan, which shall provide specific measures to restore or enhance habitat to replace the loss of coastal sage scrub and coastal bluff scrub communities. This Plan shall be focused on adaptive management principles, and shall identify detailed enhancement areas and strategies based on the parameters outlined below, with long term timing and monitoring requirements. The Plan shall:

i. Provide an up-to-date inventory of on-site native vegetation resources.
ii. Define attainable and measurable goals and objectives to achieve through implementation of the Plan. Goals and objectives shall focus on replacement of coastal sage scrub, coastal bluff scrub and rare plants removed during construction.
iii. Provide site selection and justification. Prior to identifying habitat restoration mitigation areas, both within the project area and adjacent lands, the habitat shall be surveyed for sensitive vegetation communities and special-status species, to ensure avoidance of impacts during habitat restoration implementation. Additionally, potential adjacent mitigation lands shall be assessed to ensure sites are suitable and appropriate for implementation of habitat restoration for the impacted native vegetation communities.
iv. Detail a restoration work plan including methodologies, restoration schedule, plant materials (seed and container plant) sourcing – locally genetic stock, and implementation strategies.
v. Provide a detailed maintenance plan to include removal of invasive non-native species.
vi. Define annual and final performance standards. Prior to grading, the project-related native coastal bluff scrub and coastal scrub vegetation communities shall be assessed by vegetation community type for percent cover (both

basal and vegetative), species diversity, density, and abundance. This project site native vegetation community data shall be used to define performance standards for native habitat restoration by vegetation layers (tree, shrub, grass, and forb) for each vegetation community type and for non-native plant species.

vii. Identify that the restoration areas shall be irrigation-free for at least 3 years and the performance standards have remained stable (no negative trend for richness/ diversity/ abundance/ cover of native species and no positive trend for invasive/non-native cover for each vegetation layer) for at least 3 years.

viii. Provide a monitoring plan to include methods and analysis of results. Also, include goals, success or failure criteria, and an adaptive management plan, contingency actions, and suggestions for failed restoration efforts.

Plan Requirements and Timing: Prior to issuance of zoning clearance approval, the Owner/Applicant shall contract with a qualified biologist to develop the Plan. The Plan shall outline efforts to restore or enhance coastal sage scrub and coastal bluff scrub communities in areas impacted by construction of the project. ***Monitoring*****:** The City of Carpinteria and County staff shall ensure development of the Plan and adherence to Plan measures are completed prior to commencement of any earth-moving activities. Additionally, California Department of Fish and Wildlife shall approve the Plan prior to issuance of zoning clearance approval. City and County staff shall periodically conduct site inspections to ensure compliance on site. Restored areas shall be monitored for five years following planting. Annual reports and the final report shall be submitted to the City and County.

8. **MM-BIO-6 Weed Management Plan.**
Prior to issuance of zoning clearance approval, the Owner/Applicant shall contract with a qualified biologist to develop a Weed Management Plan to be implemented during construction and implementation of the Habitat Mitigation and Monitoring Plan. The Weed Management Plan shall include, but is not limited to, the following:

- Prior to ground disturbance, a City approved qualified biologist shall map invasive weeds within the limits of impacts plus a 100-foot buffer. Invasive weeds shall be defined as California Invasive Plant Inventory Database (Cal-IPC) moderate and high ratings. Invasive species subject to control measures shall be identified. Note that non-native grasses such as bromes and wild oats shall be mapped but are not subject to control measures. Prior to ground disturbance, areas with invasive weeds shall be treated according to control methods below and BMPs for invasive weeds.
- To prevent the spread of invasive weeds and inhibit germination, the following shall be implemented:
    - Maintain vehicle wash and conduct inspections to monitor the types of materials brought on site to minimize the potential for invasive weed introduction
    - Limit disturbance areas to the permitted disturbance area
    - Limit ingress and egress to defined routes
    - Use certified weed-free products

- Invasive weed control methods shall include legally permitted herbicide, manual, and mechanical methods approved for application. The application of herbicides shall be in compliance with state and federal laws and regulations under the prescription of a pest control advisor, with the City's concurrence, and shall be implemented by a licensed qualified applicator. All product labels shall be followed. Spot treatments shall be the method of application and broadcast applications shall be avoided. Herbicides shall not be applied during or within 72 hours of a forecasted measurable rain event or during high wind conditions. Invasive weed debris accumulated during manual and mechanical removal methods shall be disposed of at an appropriate location off-site. Maintenance shall be timed to remove invasive weeds prior to seed production. The maintenance crew shall coordinate with the City approved biologist to avoid and minimize impacts to plant species and wildlife species.
- A City approved qualified biologist shall perform annual monitoring within the limits of disturbance and a 100-foot buffer to map and document invasive weed species. At any time during implementation of the Weed Management Plan, monitoring frequency may increase as needed to provide guidance to maintenance crews.

Plan Requirements and Timing: Prior to issuance of zoning clearance approval, the Owner/Applicant contract with a qualified biologist to develop the Plan. The Plan shall outline efforts to implement a weed management plan to control invasive weeds. Pre-construction survey results shall be reported and ongoing invasive weed control efforts and annual survey results shall be submitted annually and for the five year duration of the Habitat Mitigation and Monitoring Plan. ***Monitoring:*** The City of Carpinteria and County staff shall ensure development of the Plan and adherence to Plan measures are completed prior to commencement of any earth-moving activities. City and County staff shall periodically conduct site inspections to ensure compliance on site and to ensure the Plan is fully implemented.

9. **MM-BIO-7 Pre-construction Nesting Bird Surveys.**
Within 30 days prior to any vegetation clearing or ground disturbance, or use of noise-generating equipment associated with construction or grading that would occur during the nesting/breeding season of native bird species potentially nesting on the site (typically mid-February through August in the project region, or as determined by a qualified biologist), the Owner/Applicant shall have weekly surveys conducted by a qualified biologist to determine if active nests of special-status bird species, or of any bird species protected by the Migratory Bird Treaty Act or the California Fish and Game Code, are present in the disturbance zone or within 300 feet (500 feet for raptors) of the area to be disturbed. The surveys shall occur on a weekly basis, with the last survey being conducted no more than seven days prior to initiation of disturbance work. If ground disturbance is delayed, then additional pre-disturbance surveys shall be conducted such that no more than seven days will have elapsed between the survey and ground disturbance activities. The Owner/Applicant or contractor shall provide the biologist with plans detailing the extent of proposed ground disturbance prior to the survey effort.

If active nests are found, including any nests for Cooper's hawk, clearing and use of noise-generating construction within 300 feet of the nest (500 feet for raptors) shall be postponed or halted, at the discretion of the biologist, until the nest is vacated and juveniles have fledged, as determined by the biologist, and there is no evidence of a second attempt at nesting. Limits of construction to avoid an active nest shall be established in the field with highly visible construction fencing, and construction personnel shall be instructed on the sensitivity of nest areas. The results of the surveys, including graphics showing the locations of any nests detected, and any avoidance measures recommended, shall be submitted to the City and County within 14 days of completion of the pre-construction surveys to document compliance with applicable state and federal laws pertaining to the protection of native birds.
***Plan Requirements and Timing*:** Pre-construction nesting bird surveys shall be completed within 30 days prior to any vegetation clearing or ground disturbance associated with construction or grading during the bird nesting season (typically mid-February to August). The surveys shall occur on a weekly basis, with the last survey being conducted no more than seven days prior to initiation of disturbance work. ***Monitoring*:** The City of Carpinteria and County staff shall ensure the pre-construction nesting bird surveys and any avoidance requirements are completed prior to commencement of any earthmoving activities.

10. **MM-CR-1 Cultural Resource Treatment and Inadvertent Discovery Plan.** Potential impacts to cultural resources shall be minimized through development of protocols for practical adherence of mitigation measures CR-2 and CR-3 prior to and after ground disturbing construction activities associated with the proposed project. These protocols shall be outlined in a Cultural Resource Treatment Plan (CRTP). The CRTP shall be developed by a City-qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards, prior to the implementation of ground disturbing activities and include wording of each mitigation measure CR-2-4, specific and detailed explanation for implementation of each mitigation measure and contact protocol. The CRTP shall be provided to all agency personnel, consulting tribes, contractors and archaeological personnel. The existence and necessity for adherence to the CRTP shall be noted on plans, handbooks, or the like associated with tasks that may incur ground disturbance either intentionally or inadvertently.
Plan Requirements and Timing: Prior to issuance of a grading permit, the Owner/Applicant shall contract with a County-qualified/City-approved archaeologist to develop the required CRTP in accordance with the above criteria. ***Monitoring:*** City of Carpinteria/County of Santa Barbara staff shall review and authorize the CRTP prior to the commencement of ground disturbance activities to ensure that the CRTP adheres to the criteria established in CR-1.

11. **MM-CR-2 Workers Environmental Awareness Program (WEAP) Training.** All personnel participating in tasks that may incur ground disturbance either intentionally or inadvertently shall be briefed regarding unanticipated discoveries prior to the start of said activities. A basic presentation shall be prepared by a City-qualified archaeologist, meeting the Secretary of the Interior's Professional

Qualification Standards to inform all personnel working on the project about the archaeological sensitivity of proposed project areas. The purpose of the WEAP training is to provide specific details on the kinds of archaeological materials that may be identified during project activities and explain the importance of and legal basis for the protection of cultural resources. Each personnel shall also be instructed in the proper procedures to follow in the event that cultural resources or human remains are encountered. These procedures include work curtailment or redirection, and the immediate contact of the site supervisor, qualified archaeologist and if human remains are encountered, the County coroner.
Plan Requirements and Timing: Prior to issuance of a grading permit, the Owner/Applicant shall contract with a County-qualified/City-approved archaeologist to develop and conduct the required WEAP Training in accordance with the above criteria. ***Monitoring:*** City of Carpinteria/County of Santa Barbara staff shall ensure the required WEAP training has been conducted by attending the WEAP Training and documenting attendance of required personnel by means of a sign in sheet completed by all attendees of the WEAP Training.

12. **MM-CR-3 Archaeological Monitor.**
Initial ground disturbing activities shall be monitored by a County-qualified/City-approved archaeologist in accordance with the following specifications:
Temporary Impact Areas (equipment staging and materials storage outside trail alignment) – a County-qualified/City-approved archaeologist shall monitor transport and placement activities until such time that it is reasonable to ascertain that no additional prehistoric archaeological/cultural resources are located within areas of temporary disturbance of the proposed project site.
Permanent Impact Areas not including bridge piling installation (all areas of the trail alignment excepting the bridge approaches area on both sides of the UPRR alignment) – a County-qualified/City-approved archaeologist shall monitor project implementation during the initial grading and excavation activities until such time as sufficient subsurface soil has been uncovered/excavated to ascertain that no additional prehistoric archaeological/cultural resources are located on the proposed project improvement area.
Bridge piling installation – a County-qualified/City-approved archaeologist shall monitor the installation of bridge pilings within intact soils and/or any soils deeper than 10 feet below current ground surface to ascertain that no additional prehistoric archaeological/cultural resources are located on the proposed project improvement area.
The monitor shall immediately inform equipment operators in the event archaeological resources are encountered, and shall be empowered to immediately halt construction activity in the area of the discovery until assessment can be completed, and materials recovered as appropriate (refer to CR-2 for additional detail). Monitoring reports shall be provided to the City of Carpinteria/County of Santa Barbara on a monthly basis during construction, with a final monitoring report produced at the conclusion of construction activities and provided to both the City and County.

***Plan Requirements and Timing*:** Prior to issuance of a grading permit, the Owner/Applicant shall contract with a County-qualified/City-approved archaeologist to monitor initial ground disturbance activities in accordance with the above criteria.
***Monitoring*:** City of Carpinteria/County of Santa Barbara staff shall ensure the contracted archaeologist provide monitoring of initial ground disturbance activities in accordance with the above criteria through receipt of field documentation describing each day of monitoring, construction activity occurring during the monitoring, and observed soil profile conditions related to the potential for presence of archaeological resources.

13. **MM-CR-4 Discovery of Cultural Resources.**
In the event cultural resources are encountered, construction shall be redirected to another area of the project while data/resource assessment and recovery is accomplished.
Grading/construction shall be immediately suspended in the immediate area (no less than 50 feet from the area of the discovery) where cultural resources are encountered and temporarily redirected to another portion of the project area to allow the archaeologist to assess the nature, extent and significance of any discoveries and develop appropriate management recommendations for archaeological resource treatment consistent with Santa Barbara County Guidelines for the Implementation of California Environmental Quality Act of 1970 (as amended May 25, 2010). It is anticipated that recovery of artifacts would occur where project elements (such as pilings) would conflict with in situ artifact locations, and such artifacts would be properly archived in accordance with the project CEQA, City of Carpinteria and Santa Barbara County guidelines and the CRTP protocol.
Identified remedial action for the discovery shall be completed prior to allowing construction to recommence in the area, no less than 50 feet from the area of the discovery. The project sponsors shall be responsible for funding the assessment of archaeological resources encountered during construction, and for the proper archiving or preservation of such resources. A Phase 3 Archaeological Resources Assessment and Data Recovery Report shall be prepared to document any archaeological resources encountered during construction.
***Plan Requirements and Timing*:** Prior to issuance of a grading permit, the Owner/Applicant shall contract with a County-qualified/City-approved archaeologist to provide archaeological assessment and recovery of any archaeological resources encountered during project construction, in accordance with the above criteria.
***Monitoring*:** City of Carpinteria/County of Santa Barbara staff shall ensure the contracted archaeologist assess the nature, extent and significance of any archaeological discoveries occurring during project construction and develop appropriate management recommendations for archaeological resource treatment in accordance with the project CEQA, City of Carpinteria and Santa Barbara County guidelines and the CRTP protocol.
The contracted archaeologist shall assess the nature, extent and significance of any archaeological discoveries occurring during project construction and develop appropriate management recommendations for archaeological resource treatment.

14. **MM-GEO-1 Seismicity.**
The pedestrian bridge shall adhere to the recommendation identified in Appendix E to the Environmental Impact Report to withstand a peak ground acceleration (PGA) at the site of 0.8g generated by an earthquake of moment magnitude Mw=7.4.
Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria/County of Santa Barbara shall verify the engineering plans include this bridge design specification. ***Monitoring*****:** City of Carpinteria/County of Santa Barbara public works staff or construction inspector retained for the project shall inspect bridge construction to verify conformance with this specification.

15. **MM-GEO-2 Differential Settlement of Pedestrian Bridge Foundations.**
Bridge foundation construction shall adhere to the recommendation identified in Appendix E to the Environmental Impact Report, which specifies a deep foundation employing cast-in-drilled hole (CIDH) piles. Based on the anticipated loadings, Caltrans Standard Plan 24" CIDH Concrete Piles with 200 kips design capacity are recommended in the geotechnical report. Should hard cemented bedrock be encountered during the installation of the CIDH piles, coring may be necessary.
Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria/County of Santa Barbara shall verify the engineering plans include this bridge foundation specification. ***Monitoring*****:** City of Carpinteria/County of Santa Barbara public works staff or construction inspector retained for the project shall inspect foundation construction to verify conformance with this specification.

16. **MM-GEO-3 Soil Erosion/Slope Stability.**
Slope construction shall adhere to the recommendations in the geotechnical report, summarized below:
    i. All new fills placed along the trail alignment shall be placed as engineered geotextile-reinforced soils with subsurface/back drains.
    ii. Manufactured slope profiles shall be no steeper than as specified in the Bengal 2019 geotechnical report (Appendix E), or any updated version thereof which has been prepared to address final trail design.
    iii. Install adequate surface drainage facilities to collect and dispose of surface runoff properly, consistent with the drainage system designs included in 30% Project Plans for Rincon Multi- Use Trail (Appendix E), or as updated to address final trail design.
    iv. Hydro-seed the exposed newly cut and fill surfaces. Periodic watering and re-application of hydroseed shall occur as necessary until vegetation on slope surfaces has been successfully established.

    These measures, in conjunction with the slope flattening and load reduction resulting from the proposed slope cutbacks, should substantially reduce the hazards associated with both slope erosion and local/surficial slope instability under both static and seismic loading conditions.
    Plan Requirements and Timing: Prior to issuance of a grading permit, the City of Carpinteria/County of Santa Barbara shall verify the engineering plans include the above specifications. ***Monitoring*****:** City of Carpinteria/County of Santa Barbara public works staff or construction inspector retained for the project shall inspect

slope and drainage system construction to verify conformance with these specifications.

17. **MM-HAZ-1 Aerially Deposited Lead (ADL).**
Surface soils within the trail alignment segment north of the UPRR corridor shall be tested for potential ADL presence to determine if such soils may be used as fill, or must be disposed in a properly licensed landfill. Using the risk based screening levels developed by California Office of Environmental Health Hazard Assessment (OEHHA), excavated soils with a lead concentration less than or equal to 80 mg/kg total lead (analyzed by USEPA Method 6010 or 6020) would be acceptable for reuse without restrictions, including as fill material within the Rincon Trail project. Excavated soils that are considered a California hazardous waste (total lead concentration greater than or equal to 1,000 mg/kg or a soluble lead concentration greater than or equal to 5 milligrams per liter [mg/L] as determined by the California Waste Extraction Test [CAWet]) or are a RCRA hazardous waste and must be disposed of in a Class I hazardous waste landfill. Excavated soils with lead concentrations below 1,000 mg/kg but above 80 mg/kg total lead may be eligible for reuse with specific restrictions to reduce or eliminate exposure, with prior written approval from DTSC, or may be disposed of at an appropriately permitted landfill. ***Plan Requirements*:** ADL testing requirements and soil re-use restrictions according to identified ADL concentration shall be shown on grading and building plans. Since excess soil material would be generated through proposed grading activities, soils containing greater than 80 mg/kg total lead shall not be used as fill material for the project but shall be exported off site. Soil containing total lead greater than 1,000 mg/kg shall be disposed in a Class I hazardous waste landfill. ***Timing*:** Condition shall be adhered to throughout all grading and construction activities. ***Monitoring*:** City of Carpinteria and County of Santa Barbara staff shall ensure measures are on plans. City and County Grading Inspectors shall spot check and ensure compliance on site.

18. **MM-WAT-1 Obtain Coverage Under Construction General Permit.**
The project shall obtain coverage under a Construction General Permit via the State Water Resources Control Board (SWRCB) (Water Quality Order 99-08-DWQ). ***Plan Requirements*:** The requirement to obtain coverage from the SWRCB under a Construction General Permit shall be indicated on grading plans. ***Timing*:** Evidence of coverage under a Construction General Permit shall be provided to the City of Carpinteria Public Works Department and County of Santa Barbara Public Works Division prior to the initiation of grading. ***Monitoring*:** City and County Public Works staff shall confirm evidence of the Construction General Permit issuance prior to issuance of grading permits.

19. **MM-WAT-2 Stormwater Pollution Prevention Plan.**
The construction contractor shall prepare a Stormwater Pollution Prevention Plan that includes Best Management Practices (BMPs) to be implemented and monitored prior to and during construction. The following BMPs shall be incorporated into the SWPPP to minimize potential construction-related water quality impacts:

i. Disturbed areas shall be stabilized or re-vegetated prior to the start of the rainy season. The work area shall be flagged to identify its limits. Vegetation shall not be removed or intentionally damaged beyond these limits.
ii. Construction materials shall be placed in designated areas where they could not enter water bodies or storm drains due to spillage or erosion.
iii. Waste and debris generated during construction shall be stored in designated waste collection areas and containers away from watercourses and shall be disposed of regularly.
iv. During construction, washing of concrete trucks, paint, equipment, or similar activities shall occur only in areas where polluted water and materials can be contained for subsequent removal from the site. Wash water shall not be discharged to the storm drains, street, drainage ditches, creeks, or wetlands. The concrete washout area shall be isolated from water bodies, and wash water and waste shall be removed from the project site. The location of the washout area shall be clearly noted at the construction site with signs.
v. All fueling of heavy equipment shall occur in a designated area removed from water bodies and other drainages, such that any spillage would not enter surface waters. The designated refueling area shall include a drain pan or drop cloth and absorbent materials to clean up spills. The location of the fueling area shall be clearly noted at the construction site with signs.
vi. Vehicles and equipment shall be maintained properly to prevent leakage of hydrocarbons and coolant and shall be examined for leaks on a daily basis. All maintenance shall occur in a designated off-site area. The designated area shall include a drain pan or drop cloth and absorbent materials to clean up spills.
vii. Any accidental spill of hydrocarbons or coolant that may occur on the construction site shall be cleaned up immediately. Absorbent materials shall be maintained on the construction site for this purpose.
viii. Special considerations for work during the rainy season: stockpiled soils should be covered at the end of the work day, and concrete pouring shall be avoided within 15 days of a forecasted rain event to allow full curing, due to its toxic nature until it has fully cured.

***Plan Requirements*:** A Stormwater Pollution Prevention Plan (SWPPP) shall be prepared and implemented prior to construction and shall include the above elements. The SWPPP shall be submitted to City and County Public Works for review and approval prior to the issuance of grading permits for the project. ***Timing*:** The stormwater features and BMPs shall be installed and operational prior to initiation of grading. ***Monitoring*:** City and County Public Works staff shall site inspect for installation and maintenance in accordance with the approved plan and periodically thereafter to ensure proper maintenance over the duration of construction activities.

20. **MM-WAT-3 Erosion and Sediment Control Plan.**
Best available erosion and sediment control measures shall be implemented and maintained during grading and construction. Best available erosion and sediment control measures may include, but are not limited to, use of sediment basins, gravel bags, silt fences, geo-bags or gravel and geotextile fabric berms, erosion control blankets, coir rolls, jute net and straw bales. Construction access points shall be stabilized using gravel beds, rumble plates or other measures to prevent sediment from being tracked onto adjacent roadways. Any sediment or other materials tracked off site shall be removed the same day as they are tracked using dry cleaning methods.
***Plan Requirements and Timing*:** An erosion and sediment control plan shall be submitted to and approved by City and County Public Works prior to issuance of grading permits. The plan shall be designed and implemented to address erosion and sediment control during all phases of development of the site. ***Monitoring*:** City and County Public Works shall perform site inspections throughout construction.

21. **MM-WAT-4 Planting of Vegetation.**
As soon as practicable following the completion of trail construction, the contractor shall install native plantings for biological restoration and hydro-seed slope areas with an appropriate native plant seed mix, in order to provide long-term stabilization of soils disturbed during construction. Periodic watering and re-application of hydro-seed shall occur as necessary until vegetation on slope surfaces has been successfully established.
***Plan Requirements and Timing*:** Landscaping plans including biological restoration areas and hydro-seeding of manufactured slope areas submitted to City Community Development Department and County Planning & Development (CDD/P&D) for review prior to issuance of zoning clearance. ***Monitoring*:** CDD/P&D shall site inspect vegetation plantings and hydro-seed application before issuing final clearance and acceptance of the trail project.

22. **MM-WAT-5 Periodic Inspection and Maintenance of Storm Drain Components.**
Staff from City and County Parks/Public Works departments shall perform an annual inspection of stormwater components annually, prior to the on-set of the rainy season (November 1) to ensure all components are in good repair and are not blocked by debris or sediment. Any materials found to be obstructing flow in the drainage system shall be removed prior to November 1 each year. The exposed vertical portion of each of the corrugated metal pipe drains shall be examined annually for signs of corrosion, damage or openings in the drain pipe wall. Corrosion visible on the exterior pipe wall shall be treated and sealed promptly, any holes through the pipe wall shall be patched, or the damaged/affected segment shall be replaced or modified.
***Plan Requirements and Timing*:** The Applicant/Owner shall include these inspection and maintenance requirements in the final drainage system design plans. The plans shall be submitted to Community Development Department/Planning & Development (CDD/P&D) and City and County Public Works for review prior to

approval of a grading permit and issuance of zoning clearance. ***Monitoring*:** A memo with the annual inspection notes and corrective maintenance performed shall be prepared and submitted to the City and County Public Works Departments.

23. **MM-WAT-6 Storm Drain Filters.**
To minimize pollutants impacting the ocean, storm drain filters/inserts shall be installed in the project area storm drain inlets. The filters/inserts shall be maintained in working order.
Plan Requirements: Prior to approval of Grading Permits and issuance of zoning clearance, the Owner/Applicant shall submit plans identifying the type and location of filters/inserts to Community Development Department/Planning & Development (CDD/P&D) and City and County Public Works for review and approval. The location of such filters/inserts shall be noted on grading and building plans. ***Timing:*** Filters/inserts shall be installed prior to final clearance and shall be cleaned using approved methods at least twice a year, once immediately prior to November 1 (before the start of the rainy season) and once in January. ***Monitoring:*** CDD/P&D and City and County Public Works shall site inspect periodically throughout the construction phase to ensure proper installation. Records of maintenance shall be maintained by City/County and shall be submitted to CDD/P&D and City and County Public Works on an annual basis prior to the start of the rainy season and for five years thereafter. After the fifth year, the records shall be maintained by the City/County. CDD/P&D and Public Works shall review the maintenance records and site inspect as needed following completion of construction to ensure periodic cleanout.

24. **MM-NOI-1 Construction Hours.**
Construction activity for site preparation and for future development shall be limited to the hours between 8:00 a.m. and 5:00 p.m., Monday through Friday. No construction shall occur on state holidays (e.g., Thanksgiving, Labor Day) or weekends. Construction equipment maintenance shall be limited to the same hours. Non-noise generating construction activities are not subject to these restrictions.
***Plan Requirements*:** Two signs stating these restrictions shall be posted on site at each end of the proposed trail. ***Timing*:** Signs shall be in place prior to the beginning of and throughout all grading and construction activities. ***Monitoring*:** City and County Grading Inspectors shall spot check and respond to complaints.

25. **MM-NOI-2 Construction Equipment.**
All construction equipment with engines must have original manufacturer's approved muffling devices. All stationary equipment shall be physically buffered from nearby sensitive receptors.
***Plan Requirements*:** Plans shall indicate the requirement of original equipment manufacturer ("OEM") muffled equipment. ***Timing*:** This condition applies when any engine driven equipment is in use at the project site during construction. ***Monitoring*:** City of Carpinteria and County of Santa Barbara Grading Inspectors shall spot check and respond to complaints.

26. **MM-TCR-1 Native American Monitor/Observer.**
Initial ground disturbing activities shall be monitored by a Native American observer in accordance with the following specifications:
Temporary Impact Areas (equipment staging and materials storage outside trail alignment) – a Native American observer, ancestrally affiliated with the area, shall monitor transport and placement activities until such time that it is reasonable to ascertain that no additional prehistoric archaeological/cultural resources are located within areas of temporary disturbance of the proposed project site.
Permanent Impact Areas not including bridge piling installation (all areas of the trail alignment excepting the bridge approach areas on both sides of the UPRR alignment) – a Native American observer, ancestrally affiliated with the area, shall monitor project implementation during the initial grading and excavation activities until such time as sufficient subsurface soil has been uncovered/excavated to ascertain that no additional prehistoric archaeological/cultural resources are located on the proposed project improvement area.
Bridge piling installation – a Native American observer, ancestrally affiliated with the area, shall monitor the installation of bridge pilings within intact soils and/or any soils deeper than 10 feet below current ground surface to ascertain that no additional prehistoric archaeological/cultural resources are located on the proposed project improvement area.
The monitor/observer shall immediately inform equipment operators in the event archaeological resources are encountered, and shall be empowered to immediately halt construction activity in the area of the discovery until assessment can be completed, and materials recovered as appropriate (refer to CR-2 for additional detail). Monitor reports shall be provided to the City of Carpinteria/County of Santa Barbara on a monthly basis during construction, with a final monitoring report produced at the conclusion of construction activities and provided to the City and County.
***Plan Requirements and Timing*:** Prior to issuance of a grading permit, the Owner/Applicant shall contract with a Native American observer, ancestrally affiliated with the area, to monitor initial ground disturbance activities in accordance with the above criteria. ***Monitoring*:** City of Carpinteria/County of Santa Barbara staff shall ensure the Native American observer, ancestrally affiliated with the area, provide monitoring of initial ground disturbance activities in accordance with the above criteria through receipt of field documentation describing each day of monitoring, construction activity occurring during the monitoring, and observed soil profile conditions related to the potential for presence of archaeological resources.

PROJECT SPECIFIC CONDITIONS

27. **Mitigation Compliance, Monitoring and Reporting Requirement.**
Owner/Applicant shall submit to the Community Development Department and County Planning & Development (CDD/P&D) a draft monitoring program for the mitigation measures identified in the Certified EIR, approved Project Description and Conditions of Approval for review and comment. A City-approved biologist and mitigation monitors responsible for permit compliance monitoring shall be

retained and paid for by the applicant. The mitigation monitoring program shall include, but not be limited to the following elements for the entirety of the project:

- Mitigation Measures. A list of the project's mitigation measures.
- Implementation of Mitigation. Timing and party responsible for implementation of each mitigation measure.
- Mitigation Monitoring. Timing and party responsible for monitoring of each mitigation measure and a list of mitigation monitors to be retained.
- Mitigation Reporting. Procedures, timing and responsible party for reporting to the City on project mitigation compliance and monitoring.

28. **Biologist.** A City-approved qualified biologist shall be designated by the Owner/Applicant. The biologist shall be responsible for ensuring compliance with the provisions of the Mitigation Monitoring and Reporting Program. The biologist shall have authority over all other environmental monitors provided by the Owner/Applicant. The Owner/Applicant shall submit the name, contact information and qualifications of the biologist and obtain approval from the Community Development Director prior to commencement of construction.

29. **Final Architectural Review.** The project shall return to the City of Carpinteria Architectural Review Board ("ARB") for final review and approval of construction plans. ***Plan Requirements:*** Plans submitted for final review by the ARB shall include construction plans and specifications all project elements, including but not limited to, fencing and railing, bridge design, signage, landscaping, and any proposed lighting. ***Timing:*** Final review by the ARB shall occur prior to zoning clearance and issuance of grading permits. ***Monitoring:*** CDD staff shall be responsible for ensuring the project receives final approval from the ARB prior to zoning clearance or issuance of grading permits. CDD staff shall ensure that the final plans approved for construction reflect any required revisions by the ARB.

30. **Traffic Management Plan.** Provide a detailed Traffic Management Plan for review by Public Works, Community Development, Carpinteria-Summerland Fire Protection District and the Santa Barbara County Sheriff's Office, and obtain approval from the Public Works Director in consultation with the Community Development Director. The plan shall identify:
    - Construction Phases. Project construction stage exhibits including work descriptions.
    - Staging and Parking Areas. Equipment staging, materials storage and construction worker parking areas.
    - Truck Routes. Construction truck routes to minimize noise and traffic effects to residential neighborhoods.
    - Ramp Closures and Detours. Any proposed closures of US 101 ramps and/or detours, by construction stage, if applicable.
    - City Street Closures and Detours. Any proposed closures of City streets and/or detours, by construction stage.
    - Signs and Traffic Control Measures. Signage and other planned temporary traffic control measures, by construction stage.

- Public Awareness. A program for public awareness and outreach to commuters, property owners, businesses, residents and agencies affected by project construction.
- Public Relations Committee. Applicant is required to form and support a Public Relations Committee consisting of Caltrans, SBCAG, a public relations consultant, business representatives, residents, transit and public safety agencies and City representatives. The Committee shall meet regularly prior to and during construction. Applicant shall review construction, construction phasing, mitigation measures, public relations efforts and permit conditions of approval with the committee. Applicant shall consider feedback and comments from the committee and the general public throughout project construction and make necessary adjustments in response to problems and/or concerns when possible.
- Maintenance of Access. Plans for providing access to businesses, coastal dependent uses and recreational uses during construction.
- Motorist Information Measures. Elements such as radio announcements and appropriate signage.
- Incident Response Measures. Strategies such as construction zone enhanced enforcement program ("COZEEP") and freeway service patrol.
- Coordination and Reporting. A program for ongoing reporting and coordination with the City and other affected agencies throughout construction.

31. **Trail Improvement Maintenance Agreement.** The City and County shall enter into a Trail Improvement Maintenance Agreement to define the maintenance responsibilities of the trail improvements. The Trail Improvement Maintenance Agreement must be signed and entered into prior to issuance of any Engineering Permits.

32. **Pre-Construction Conference.** Prior to commencement of construction, a preconstruction conference shall be held by the Resident Engineer to include construction processes and environmental mitigation and monitoring. The conference shall include representatives from Public Works, Community Development, County of Santa Barbara staff, Project Engineer, Landscape Architect, Contractor and Subcontractor(s), Biologist, and Mitigation Monitors.

33. **Temporary Construction Staging Areas.** The applicant shall submit to the Public Works Director for approval any areas intended for temporary staging of construction equipment and materials in the City of Carpinteria.

34. **Interpretive Signage.** Consistent with development standard CMC §14.45.030(8)(b), an educational or interpretive display shall be installed which describes the nearby harbor seal rookery. Plans and details depicting the proposed location, design, construction and content of the display shall be prepared and submitted to the Community Development Department for review and approval prior to issuance of any Engineering Permits for the project.

35. **Timing of Project Completion.** Pursuant to the requirements of the Transportation Corridor Wetland Overlay District (CMC §14.45), the Santa Claus Lane Multi-Use Path project shall be completed and open to the public no later than the completion of the Linden Avenue and Casitas Pass Road Interchanges and Via Real Extension construction.

CONDITIONAL USE PERMIT CONDITIONS

36. This Conditional Use Permit is not valid until an Engineering Permit for the development and/or use has been obtained. Failure to obtain said Engineering Permit shall render this Conditional Use Permit and Coastal Development Permit null and void. Prior to the approval of the Engineering Permit, all of the conditions listed in this Conditional Use Permit and Coastal Development Permit that are required to be satisfied prior to approval of an Engineering Permit must be satisfied. Upon issuance of the Engineering Permit, the Conditional Use Permit and Coastal Development Permit shall be valid. The effective date of this Permit shall be the date of action by the Planning Commission, or if appealed, the date of action by the Coastal Commission.

37. If the Planning Commission or City Council determines at a noticed public hearing that the permittee is not in compliance with any permit condition(s), the Planning Commission or City Council is empowered, in addition to revoking the permit pursuant to said section, to amend, alter, delete or add conditions to this permit.

38. Any use authorized by this Conditional Use Permit and Coastal Development Permit shall immediately cease upon expiration or revocation of this Conditional Use Permit and Coastal Development Permit. Any Engineering Permit issued pursuant to this Conditional Use Permit and Coastal Development Permit shall expire upon expiration or revocation of the Conditional Use Permit and Coastal Development Permit. Conditional Use Permit and Coastal Development Permit renewals must be applied for prior to expiration of the Conditional Use Permit and Coastal Development Permit.

39. The owner/applicant's acceptance of this permit and/or commencement of construction and/or operations under this permit shall be deemed acceptance of all conditions of this permit by the permittee.

40. Within two years after the effective date of this permit, construction shall commence. Construction cannot commence until an Engineering Permit has been issued. Failure to commence the construction pursuant to a valid Engineering Permit shall render the Conditional Use Permit and Coastal Development Permit null and void.

41. All time limits may be extended by the Planning Commission or City Council for good cause shown, provided a written request, including a statement of reasons for the time limit extension request is filed with Community Development prior to the expiration date.

42. If the owner/applicant requests a time extension for this permit, the permit may be revised to include updated language to standard conditions and/or mitigation measures and additional conditions and/or mitigation measures which reflect changed circumstances or additional identified project impacts. Mitigation fees shall be those in effect at the time of issuance of an Engineering Permit.

43. Before commencing any work pertaining to the erection, alteration, enlarging or rebuilding of any structure or improvement, the owner/applicant shall obtain an Engineering Permit. The permit is necessary to ensure implementation of the conditions required by the Planning Commission. Before any Permit will be issued by Community Development, the owner/applicant must obtain written clearance from all agencies having conditions; such clearance shall indicate that the applicant has satisfied all pre-construction conditions. A form for such clearance is available from Community Development.

44. If, at any time, the Planning Commission determines that there has been, or may be, a violation of the findings or conditions of this Conditional Use Permit and Coastal Development Permit, or of the Municipal Code regulations, a public hearing may be held before the Planning Commission to review this permit. At said hearing, the Planning Commission may add additional conditions, or recommend enforcement actions, or revoke the permit entirely, as necessary to ensure compliance with the Municipal Code, and to provide for the health, safety, and general welfare of the City.

45. City Manager and/or Community Development Director shall be informed of any minor changes to the project scope. Any minor changes may be approved by the City Manager and/or Community Development Director. Any major changes will require the filing of a revision application to be considered by the Planning Commission.

46. All requirements of the City of Carpinteria (including but not limited to public improvements as defined in the City of Carpinteria Municipal Code (CMC), Section 15.16.110) and any other applicable requirements of any law or agency of the State and/or any government entity or District shall be met.

47. The standards defined within the City's adopted model Building Codes (UBC; NEC; UMC; UFC; UPC; UHC) relative to the building and occupancy shall apply to this project.

48. Any and all damage or injury to public property resulting from this development, including without limitation, City streets and storm drain infrastructure, shall be corrected or result in being repaired and restored to its original or better condition.

49. No Engineering Permit shall be issued for this project prior to meeting all required terms and conditions listed herein. When not specified herein, all conditions shall be satisfied prior to issuance of an Engineering Permit or prior to commencement of construction when allowed by the Community Development Director.

50. To allow time for the utility companies to locate and mark their facilities for the contractor, the applicant shall telephone Underground Service Alert (USA) toll free at 1-800-227-2600 a minimum of 48 hours prior to the start of construction. For best response, provide as much notice as possible, up to 10 working days.

51. Compliance with the attached Departmental and District letters is required as follows. Where not specified otherwise, Conditions shall be met prior to the start of construction:
    a. Carpinteria Sanitary District letter dated October 31, 2019
    b. Santa Barbara County Air Pollution Control District letter dated November 12, 2019

52. All applicable final conditions of approval shall be printed in their entirety on applicable pages of grading/construction plans submitted to Community Development. These shall be graphically illustrated where feasible. The approved set of plans shall be retained at the construction site for review by the Public Works Director during the course of construction.

53. Owner/Applicant shall ensure that the project complies with all approved plans and all project conditions including those which must be monitored after the project is built and occupied. To accomplish this, owner/applicant agrees to contact Community Development at least two weeks prior to commencement of construction activities to schedule an onsite pre-construction meeting with agency personnel and key construction personnel.

54. Prior to issuance of an Engineering Permit, the owner/applicant shall provide a signed copy of the Conditions of Approval on a form acceptable to Community Development. Such form may be obtained from the Community Development Department. Written authorization to proceed and consent to conditions of approval by the applicant shall be provided to the City prior to commencement of any demolition or construction activity.

55. Written authorization to proceed and consent to conditions of approval by the applicant shall be provided to the City prior to grading permit issuance.

Approved by the Planning Commission on January 18, 2022

I HAVE READ AND UNDERSTOOD, AND I WILL COMPLY
WITH ALL ABOVE STATED CONDITIONS OF THIS PERMIT

Subject: Project No. 19-2015-CUP/CDP
Carpinteria Rincon Trail Project

Dear Mr. Bobroff;

Thank you for the opportunity to provide comments on the subject project. The project applicant proposes to construct a 2,800-foot long paved multi-use trail extending from the eastern terminus of Carpinteria Avenue in the City of Carpinteria to Rincon Beach Park in the County of Santa Barbara, near the Ventura County line. The proposed trail would be 16 feet in width (comprised of a 10-wide path with a 3-foot paved shoulder along each side of the trail). The trail project includes a new 160-foot long clear span pre-fabricated bridge crossing over the UPRR alignment. Grading and earthwork quantities necessary to cut the trail bench and stabilize slopes in the project area estimated at 104,000 cubic yards of cut, 10,300 cubic yards of which would be used for fill on-site. The remaining 94,000 cubic yards of cut material would be exported offsite. A storm drain collection system is proposed for the trail alignment, with new drain outlets to the ocean.

The Carpinteria Sanitary District (District) has the following initial comment:

- The District has a 4-inch diameter HDPE sewer force main that is located immediately north (5 feet to 30 feet) of the proposed trail alignment. At stations 21 through 23.5, the proposed trail is approximately five (5) horizontal feet from the force main. It also appears the proposed trail is 5 to 10 vertical feet from the force main. This force main is a high priority subsurface installation that provides sewer service to the Rincon Point community.

- Contractors excavating, boring, drilling, sinking fenceposts or other subsurface work must take extreme precaution to ensure the force main is protected during the construction of the trail. The District should be notified when excavation activities are occurring between stations 21 through 24. This should be noted on the construction drawings.

If you have any questions regarding the comments provided by the District, please contact me at (805) 684-7214, ext. 13.

Sincerely,
CARPINTERIA SANITARY DISTRICT

Re: Air Pollution Control District Suggested Conditions on Rincon Trail Project, 19-2015-CUP/CDP

Dear Nick Bobroff:

The Air Pollution Control District (District) has reviewed the referenced project, which consists of the construction and operation of a 2,800-foot long, 16-foot wide concrete paved multi-use trail extending from the eastern terminus of Carpinteria Avenue in the City of Carpinteria to Rincon Beach Park in the County of Santa Barbara, near the Ventura County line. The trail will include a 160-foot long pre-fabricated bridge over the railroad tracks. Grading is estimated at 104,000 cubic yards (CY) of cut, 10,300 CY of fill, and 94,000 CY of export. The subject property, identified in the Assessor Parcel Map Book as APNs 001-220-032, 001-220-092, 001-220-100, and 001-220-101, is located at the eastern end of Carpinteria Avenue in the City of Carpinteria.

Air Pollution Control District staff offers the following suggested conditions:

1. Standard dust mitigations (**Attachment A**) are recommended for all construction and/or grading activities. The name and telephone number of an on-site contact person must be provided to the District prior to grading/building permit issuance.

2. District Rule 345, *Control of Fugitive Dust from Construction and Demolition Activities* establishes limits on the generation of visible fugitive dust emissions at demolition and construction sites. The rule includes measures for minimizing fugitive dust from on-site activities and from trucks moving on- and off-site. Please see www.ourair.org/wp-content/uploads/rule345.pdf.

3. The State of California considers particulate matter emitted by diesel engines carcinogenic. Therefore, during project grading, construction, and hauling, construction contracts must specify that contractors shall adhere to the requirements listed in **Attachment B** to reduce emissions of particulate matter (as well as of ozone precursors) from diesel equipment. Recommended measures should be implemented to the maximum extent feasible.

4. All portable diesel-fired construction engines rated at 50 bhp or greater must have either statewide Portable Equipment Registration Program (PERP) certificates or District permits prior to grading/building permit issuance. Construction engines with PERP certificates are exempt from District permit, provided they will be on-site for less than 12 months.

RECEIVED
NOV 18 2019
CITY OF CARPINTERIA

Aeron Arlin Genet, Air Pollution Control Officer

5. At all times, idling of heavy-duty diesel trucks should be minimized; auxiliary power units should be used whenever possible. State law requires that:
   - Drivers of diesel-fueled commercial vehicles shall not idle the vehicle's primary diesel engine for greater than 5 minutes at any location.
   - Drivers of diesel-fueled commercial vehicles shall not idle a diesel-fueled auxiliary power system (APS) for more than 5 minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle. Trucks with 2007 or newer model year engines must meet additional requirements (verified clean APS label required).
   - See www.arb.ca.gov/noidle for more information.

If you or the project applicant have any questions regarding these comments, please feel free to contact me at (805) 961-8873 or via email at HoD@sbcapcd.org.

Sincerely,

Desmond Ho
Air Quality Specialist
Planning Division

Attachments: Fugitive Dust Control Measures
Diesel Particulate and NO_x Emission Measures

cc: Planning Chron File

air pollution control district
SANTA BARBARA COUNTY

ATTACHMENT A
FUGITIVE DUST CONTROL MEASURES

These measures are required for all projects involving earthmoving activities regardless of the project size or duration. Projects are expected to manage fugitive dust emissions such that emissions do not exceed APCD's visible emissions limit (APCD Rule 302), create a public nuisance (APCD Rule 303), and are in compliance with the APCD's requirements and standards for visible dust (APCD Rule 345).

- During construction, use water trucks or sprinkler systems to keep all areas of vehicle movement damp enough to prevent dust from leaving the site and from exceeding the APCD's limit of 20% opacity for greater than 3 minutes in any 60 minute period. At a minimum, this should include wetting down such areas in the late morning and after work is completed for the day. Increased watering frequency should be required when sustained wind speed exceeds 15 mph. Reclaimed water should be used whenever possible. However, reclaimed water should not be used in or around crops for human consumption.
- Onsite vehicle speeds shall be no greater than 15 miles per hour when traveling on unpaved surfaces.
- Install and operate a track-out prevention device where vehicles enter and exit unpaved roads onto paved streets. The track-out prevention device can include any device or combination of devices that are effective at preventing track out of dirt such as gravel pads, pipe-grid track-out control devices, rumble strips, or wheel-washing systems.
- If importation, exportation, and stockpiling of fill material is involved, soil stockpiled for more than one day shall be covered, kept moist, or treated with soil binders to prevent dust generation. Trucks transporting fill material to and from the site shall be tarped from the point of origin.
- Minimize the amount of disturbed area. After clearing, grading, earthmoving, or excavation is completed, treat the disturbed area by watering, OR using roll-compaction, OR revegetating, OR by spreading soil binders until the area is paved or otherwise developed so that dust generation will not occur. All roadways, driveways, sidewalks etc. to be paved should be completed as soon as possible.
- Schedule clearing, grading, earthmoving, and excavation activities during periods of low wind speed to the extent feasible. During periods of high winds (>25 mph) clearing, grading, earthmoving, and excavation operations shall be minimized to prevent fugitive dust created by onsite operations from becoming a nuisance or hazard.
- The contractor or builder shall designate a person or persons to monitor and document the dust control program requirements to ensure any fugitive dust emissions do not result in a nuisance and to enhance the implementation of the mitigation measures as necessary to prevent transport of dust offsite. Their duties shall include holiday and weekend periods when work may not be in progress. The name and telephone number of such persons shall be provided to the Air Pollution Control District prior to grading/building permit issuance and/or map clearance.

PLAN REQUIREMENTS: All requirements shall be shown on grading and building plans and/or as a separate information sheet listing the conditions of approval to be recorded with the map. **Timing:** Requirements shall be shown on plans prior to grading/building permit issuance and/or recorded with the map during map recordation. Conditions shall be adhered to throughout all grading and construction periods.

MONITORING: The Lead Agency shall ensure measures are on project plans and/or recorded with maps. The Lead Agency staff shall ensure compliance onsite. APCD inspectors will respond to nuisance complaints.

SANTA BARBARA COUNTY

ATTACHMENT B
DIESEL PARTICULATE AND NO_x EMISSION REDUCTION MEASURES

Particulate emissions from diesel exhaust are classified as carcinogenic by the state of California. The following is a list of regulatory requirements and control strategies that should be implemented to the maximum extent feasible.

The following measures are required by state law:

- All portable diesel-powered construction equipment greater than 50 brake horsepower (bhp) shall be registered with the state's portable equipment registration program OR shall obtain an APCD permit.
- Fleet owners of diesel-powered mobile construction equipment greater than 25 hp are subject to the California Air Resource Board (CARB) In-Use Off-Road Diesel-Fueled Fleets Regulation (Title 13, California Code of Regulations (CCR), §2449), the purpose of which is to reduce oxides of nitrogen (NOx), diesel particulate matter (DPM), and other criteria pollutant emissions from in-use off-road diesel-fueled vehicles. Off-road heavy-duty trucks shall comply with the State Off-Road Regulation. For more information, see www.arb.ca.gov/msprog/ordiesel/ordiesel.htm.
- Fleet owners of diesel-fueled heavy-duty trucks and buses are subject to CARB's On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation (Title 13, CCR, §2025), the purpose of which is to reduce DPM, NOx and other criteria pollutants from in-use (on-road) diesel-fueled vehicles. For more information, see www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm.
- All commercial off-road and on-road diesel vehicles are subject, respectively, to Title 13, CCR, §2449(d)(3) and §2485, limiting engine idling time. Off-road vehicles subject to the State Off-Road Regulation are limited to idling no more than five minutes. Idling of heavy-duty diesel trucks during loading and unloading shall be limited to five minutes, unless the truck engine meets the optional low-NOx idling emission standard, the truck is labeled with a clean-idle sticker, and it is not operating within 100 feet of a restricted area.

The following measures are recommended:

- Diesel equipment meeting the CARB Tier 3 or higher emission standards for off-road heavy-duty diesel engines should be used to the maximum extent feasible.
- On-road heavy-duty equipment with model year 2010 engines or newer should be used to the maximum extent feasible.
- Diesel powered equipment should be replaced by electric equipment whenever feasible. Electric auxiliary power units should be used to the maximum extent feasible.
- Equipment/vehicles using alternative fuels, such as compressed natural gas (CNG), liquefied natural gas (LNG), propane or biodiesel, should be used on-site where feasible.
- Catalytic converters shall be installed on gasoline-powered equipment, if feasible.
- All construction equipment shall be maintained in tune per the manufacturer's specifications.
- The engine size of construction equipment shall be the minimum practical size.
- The number of construction equipment operating simultaneously shall be minimized through efficient management practices to ensure that the smallest practical number is operating at any one time.
- Construction worker trips should be minimized by requiring carpooling and by providing for lunch onsite.
- Construction truck trips should be scheduled during non-peak hours to reduce peak hour emissions whenever feasible.
- Proposed truck routes should minimize to the extent feasible impacts to residential communities and sensitive receptors.
- Construction staging areas should be located away from sensitive receptors such that exhaust and other construction emissions do not enter the fresh air intakes to buildings, air conditioners, and windows.

PLAN REQUIREMENTS AND TIMING: Prior to grading/building permit issuance and/or map recordation, all requirements shall be shown as conditions of approval on grading/building plans, and/or on a separate sheet to be recorded with the map. Conditions shall be adhered to throughout all grading and construction periods. The contractor shall retain the Certificate of Compliance for CARB's In-Use Regulation for Off-Road Diesel Vehicles onsite and have it available for inspection.

MONITORING: The Lead Agency shall ensure measures are on project plans and/or recorded with maps. The Lead Agency staff shall ensure compliance onsite. APCD inspectors will respond to nuisance complaints.

CONSENT CALENDAR 1) Minutes of the regular Planning Commission meeting held December 6, 2021 MOTION Upon a motion by Commissioner Allen, seconded by Commissioner Moyer, the Planning Commission voted 5-0 to approve the minutes of the regular Planning Commission meeting held December 6, 2021, as presented (Moyer, La Fevers, Allen, Benefield and Callender voted yes).	CONSENT CALENDAR
NEW PUBLIC HEARING 2) Project: Rincon Trail, Project #19-2015-CUP/CDP Location: Connection of the east end of Carpinteria Avenue to Rincon Beach County Park	NEW PUBLIC HEARING

Applicant: Matt Roberts, Parks, Recreation and Public Facilities Director
Planner: Nick Bobroff

Hearing on the request of Matt Roberts, Parks, Recreation and Public Facilities Director for the City of Carpinteria to consider Project 19-2015-CUP/CDP (application filed October 17, 2019) for a Conditional Use Permit and a Coastal Development Permit to allow the construction of the 850-linear foot segment of the proposed Rincon Trail project located in the City of Carpinteria (the remaining 1,900 proposed trail is located within the jurisdiction of the County of Santa Barbara); and to certify the Environmental Impact Report (EIR) prepared for the entirety of the project pursuant to the California Environmental Quality Act (CEQA) Guidelines. The EIR and all documents referenced therein may be reviewed at the Community Development Department, 5775 Carpinteria Avenue, Carpinteria. The EIR is also available for review on the City website at: https://carpinteriaca.gov/public-works/engineering-division/rincon-multi-use-trail/. The application involves City and Caltrans rights-of-way located at the eastern end of the City of Carpinteria, and parcels owned by Union Pacific Railroad and County of Santa Barbara, located outside of the City of Carpinteria in unincorporated Santa Barbara County (APNs 001-220-032, 001-220-092, 001-220-100, and 001-220-101).

DISCLOSURE EX-PARTE COMMUNICATIONS
Commissioner Allen disclosed that during daylight savings he and his wife walk daily from Viola Fields to the Bluffs, and to the King property. Most of the time there are not hang gliders, often there are, and the landings are sometimes necessary on Union Pacific Railroad property.

Nick Bobroff presented the staff report and said staff was recommending approval of the project as presented in the report.

Upon request from Commissioner Callender, Mr. Bobroff provided information on the Environmental Review Committee's deliberations and how they voted. Members were as follows: Steve Goggia, Community Development Director; John Ilasin, Public Works Director; Natasha Lohmus, member of the public; Vince Semonsen, contract City biologist; and Erin Maker, Public Works environmental coordinator. Mr. Ilasin recused himself from either vote, and Vince and Natasha were the most vocal proponents of Alternative 4, with a resulting 4-0 vote in its favor.

Commissioner Callender asked how the change to support Alternative 3 came about. Mr. Bobroff said it was found to be the environmentally

superior alternative and was identified as best meeting all project objectives, while Alternative 4 didn't meet all of the project objectives. Commissioner Callender asked if a hybrid of Alternatives 3 and 4 had been considered, and Mr. Bobroff explained there has been talk between County Parks and SBCAG about ideas for a protected bike path through the area. A lengthy discussion about airflow took place. Commissioner Callender asked for details about the soaring community's desires regarding airflow, the logic in determining impacts weren't significant, and how Alternative 3 reduced them. Mr. Bobroff clarified that the benefit to Alternative 3 was that it didn't only reduce impacts to the soaring community but slightly reduced environmental impacts across the board by further minimizing disruptive earthwork. He explained soaring impacts were found in the EIR to be Class 3, which doesn't require mitigation, but that Alternative 3 would nevertheless further slightly reduce the severity of the impacts to airflow. Environmental consultant, Jonathan Leech of Dudek, spoke about the methodology for evaluating airflow impacts and the threshold at which impacts to the soaring community would be considered significant. City Attorney Mack Carlson explained the airflow analysis was performed under CEQA Guidelines, and CEQA's focus is on significant physical changes to the environment and doesn't apply to social, recreational, economic activities. It's why the City did additional airflow study analysis. Commissioner Callender expressed concern about the logic in the EIR and asked if it was the City's position that airflow changes are not changes to the physical environment. City Attorney Mack Carlson explained recreation activities are consideration for project approval, but they just aren't the focus of a document under CEQA. He explained that you can determine based on substantial evidence a finding that some threshold exists for substantial change based on airflow, but the City doesn't have an obligation to establish those thresholds as part of its compliance with CEQA. Commissioner Allen asked when it does rise to a level of significance, such as wind destroying a pelican nesting site, if it would be significant under CEQA. City Attorney Mack Carlson agreed it would and noted cumulative effects rising to significant changes are part of the analysis. Commissioner Allen pointed out they can deny the project due to the soaring, but it would be under the CUP and not the EIR.	

Commissioner Callender indicated he would not be supportive of the City's recommendation. He said his reading is that the City demonstrated a change to the physical environment that has an impact on the soaring community. He provided details on how his logic would be guided.

John Ilasin, Carpinteria Public Works Director, introduced the development team consisting of members from the City of Carpinteria, Caltrans, the County of SB, and SBCAG.

Matt Roberts, City of Carpinteria Parks and Recreation Director, spoke about the vision for the trail connection and its challenges. The railroad likes the project for public safety purposes and one of the purposes was to get people off the informal trails in the rail corridor. He explained the proposed trail is not intended to be used just as a pass-through, the trail itself is the destination. He noted the various grants that were obtained for the project. The design team has made a lot of compromises to make it less costly and less impactful. They want people off the tracks and off the side of the freeway. Regarding usage, it's not unlikely they'll see 250,000 visitors per year. Among other things, he spoke about Alternative 4, describing it as a freeway trail that wouldn't do what it's supposed do, which is getting people out on the trail to hike and ride their bikes. They want the trail to be irresistible, he said.

David Emerson, Caltrans Project Manager, said they are in favor of encouraging people to use different modes of transportation and the project is similar to the Santa Claus Line Bike Path project. Among other things, he explained the trail will ultimately be owned and maintained by the City of Carpinteria, which allows them some flexibility in design.

Jeff Lindgren, County of Santa Barbara Parks Division, said they are pleased to see the project moving forward and are very much in support. They hope the Planning Commission will support it. He said one of the unique aspects is how it connects to the community of Carpinteria.

Fred Luna, Santa Barbara County Association of Governments (SBCAG), spoke about how they've been involved in funding the project and have been working closely with Caltrans. He said they are very much in support of the project, have worked diligently as a team with the City for years.

BREAK – Chair Benefield called for a 3-minute break.

Jonathan Leech of Dudek, in response to more questions about how wind velocity affects physical impacts, said he had worked on a project with a skyscraper that was affecting wind currents in a body of water next to it. He explained they had consulted with a professor of thermodynamics who

researched wind tunnel models and airflows, and changes in wind weren't a part of the Rincon Trail project. The professor concluded his models were appropriate for the larger conditions. Mr. Leech said an upper bench was responsible for a lot of turbulence, but Alternative 3 removed the upper bench which gives us the profile we have today. He explained that migratory birds and nesting patterns wouldn't be affected, which is something that would have been a physical effect under CEQA. He said under the CEQA guidelines, effects to the environment don't include immediate effects to recreation.

Commissioner Allen added to his disclosure of ex-parte communications that Seal Watch recorded over 30,000 visitors into the overlook over the years prior to the pandemic.

PUBLIC HEARING OPENED – Chair Benefield opened the public hearing. The following are highlights:

1.Aaron La Plante (did not appear)
2. Karl Cameron, pilot who has flown at Rincon for 30 years, expressed support for Alternative 4. His comments included that design options are still being explored at this point, there is still an uncapped oil well which is an environmental concern, and there are 2,800 people who signed a petition against Option 3 and support Option 4.
3. Gary Mussell, Director of Friends of Bates Beach, expressed support for Plan 4 and asked that they reject Plan 3. Highlights included statements that the parking lot is not ADA compliant and it's hard for cars to back out of parking spaces (visibility issues); he questioned why the EIR says the parking lot is not significant enough to be part of the report; and he likes the idea of a split trail (a hybrid of Alternatives 3 and 4).
4. Robert Pyle, suggested placing removal of the bric-a-brac into the project scope. He said people are climbing it to access the parking lot at the west end of the beach.
5. George Jimenez said he is also in the area daily and asked Commissioner Allen if seal watchers had permits to cross the tracks and have permission from the railroad company. He complained about the use of a cement trail. He noted that trail users are dumped into the Rincon parking lot which is already unsafe. He spoke about how we are using funds to attract tourists instead of using them for transportation purposes.
6. John Greynald announced he was there to respond to questions about the air study. He questioned why it was included in the EIR if CEQA guidelines don't address it. Among other things, he said the project is being ramrodded through, and it should be clear why the study is incomplete.
7. Otis Gillespie displayed photos of the flying site and the bluff called Little Diamond Head, specifically pointing out how the environment was going to be impacted by drainage pipe outflows and stanchions.

8. Erin Finnegan, representing Santa Barbara Middle School, expressed appreciation for the fact we're even considering the bike path. She said they have done bike trips with kids for 30 years and spoke about how important these paths are for community connectedness, health and safety.
9. Randall Davy, avid bike rider and pilot, supports the idea of coastal access. He spoke about the test of empathy and how when a take is considered, it's important that the project is not force fed in a way that creates second guessing and hard feelings for years to come. He said Alternative 4 hasn't been truly fleshed out yet.
10. Helen O'Neil of Bike Ventura and Bike Oxnard spoke about bike safety issues in the parking lot and expressed support for Alternative 4. She said less bikes would have to go through the parking lot.
11. Noah Wu, long-time Carpinteria resident, said he is against the pathway, noting the overflow from Rincon that has been taking place. He expressed concern when everyone finds out about the bike path that they're going to park along Carpinteria Avenue. He's nervous about the congestion and how bikes and pedestrians will be flowing through Rincon parking lot.
12. Chris Tierly?, beginner pilot visiting from New Zealand, said there are very few places he can learn to fly, and Bates has been very special for him. He hopes we can have both recreational groups enjoy the area together.
13. Jamie Bishop complained that the proposed final EIR is flawed and should not be certified without further amendment. She said the project is not consistent with Coastal Act Section 30251. She expressed support for Alternative 4.
14. Susan Allen, standing in for Ted Rhodes of Citizens for Carpinteria Bluffs, read a letter in support of the project and the Planning Commission certifying the EIR.
15. Aja Rajumani said he is a pilot and member of the soaring community. Regarding the change of airflow movements having no effect on the environment, he said he studied ecology and they do have an effect on birds, butterflies, etc. He recalls biking through here years ago and the Carpinteria part stood out in his mind. He doesn't think bikers would notice if they went behind the hill on one section of the trail.

PUBLIC HEARING CLOSED – Chair Benefield closed the public hearing.

Planner Nick Bobroff responded to concerns raised during public comment. Regarding drainage outflows discussed, he said they would be replaced with new piping running down a bluff face, which would be a significant improvement. He clarified the bridge is free span and there will be no stanchions. Regarding air flow changes in the EIR, he explained there will be no impacts to birds and wildlife in any significant manner. About safety concerns in the parking lot, he said the City's consulting traffic engineer studied it and, because it's a slow speed environment, the addition of cyclists and pedestrians should not be an issue provided they use common

sense. With respect to consistency with Section 30251, he said the section doesn't preclude earthwork from occurring, and the work must be done to accommodate any trail. He added that the slope is going to be stabilized through revegetation and will look more natural than it currently does. Concerning masses of people parking on Carpinteria Avenue, he explained part of a future project is to build a parking lot and trail improvements on the Rincon Bluffs Preserve, although it is not guaranteed.

Commissioner Allen said he is all for soaring and wishes there was a way to ensure and improve it in our county. He walks up there a lot and has often trespassed over the tracks to get to the County park. He said the project is part of a larger statewide effort and he feels a responsibility to ensure the best trail for the most people. In balancing the interest of soaring over the long-term interest of the population of CA and other visitors, he wants a trail that benefits the majority in the best way possible. He would hate to make a decision for the soaring community that might not be able to continue, noting there is no guarantee they will be able to continue to use the King property. They don't know what project will be proposed there unless the community can acquire that hilltop. He agreed many trespass on UPRR property, and we don't know what the railroad will do for safety reasons. They have legal right to fence it all, which is why approving a project that is less than ideal for users in the future would be a mistake.

About the EIR, Allen said it is undisputable in that it's much nicer to walk through the County Park, and the Coastal Act prioritizes aesthetics. As for Seal Watch, he clarified it has nothing to do with coastal trails and stays on the beach. About certification of the EIR, he felt it was a mistake to include the soaring study but said the EIR is totally supportable. There is no threshold because recreational activity is not part of its purview and including it would be expanding its scope. All other impacts are well analyzed, so he can accept and certify it. He expressed support for certifying the EIR, for Alternative 3 and approval of the CUP/CDP, stating that it benefits the most people and accomplishes the goal of the California Coastal Trail.

Commissioner Moyer said Alternative 4 is depressing and he questioned its constructability considering its slope, angle and what has to be done to create a path. The path won't be ADA compliant, and it's just basically a place to get from point "a" to point "b". The project that is designed will correct a lot of problems, including drainage. He suggested the gliding community would be better served to start a non-profit and go to King and enter into a discussion about a contract to secure a glider port there; however, he warned there could be issues with the FAA. He said it would be wonderful if there was a legal glider port there. He can support the EIR,

and he can understand the reason it doesn't consider recreation – it's more concerned with the environment.

Commissioner Callender said he is going to vote not to accept the EIR as adequate. The key issue is the notion that alteration of the wind characteristics is not a feature of the natural environment. He is a process engineer and likes processes that work well, and he is bothered by the one we followed. When the MND was brought before him, he felt recreational aspects weren't being addressed. He said leadership and vision is a key part of how things get done, and this project was spearheaded by Parks Director Matt Roberts who has a vision. It's clear where his sympathies lie, which he doesn't begrudge, but at the same time we need to draw a line with this EIR analysis process. The purpose of this EIR is to clearly spell out the impacts, and he feels a leaning on the scales for salesmanship to minimize the impacts to the soaring community. It has caused us to get a document that is not as good as it should be. He'd like soaring impacts acknowledged as a physical impact on the environment with a significant effect. He feels this process has found us ways to get to a decision the applicant wants, and we are failing the test of empathy, which disappoints him.

BREAK – Chair Benefield called for a 2-minute break.

Chair Benefield spoke about how they try to balance what is best but mostly they are on the side of the bigger community. She doesn't hear anyone say they cannot soar due to Alternative 3; they simply cannot do it the way they did before. She expressed support for the EIR, CUP and CDP. She said they bent over backwards to get a study but they (soaring community) didn't like it. The most people who will benefit is the general public, not the soaring community, and that's the balancing they do. She loves soaring and it fascinates her, but it's not the main public benefit. The major public benefit is for bikers and walkers. She lives 8 feet from a trail by the marsh, and during Covid it has been packed. She said we need substantial structure to move on. She recommended approval of all three items and entertained a motion

MOTION
Commissioner Allen moved that the Planning Commission adopt the attached Resolution PC-22-001 thereby acting on behalf of City of Carpinteria as the lead agency as defined by CEQA, accepting and certifying the Environment Impact Report (EIR) for the Rincon Trail Project as having satisfied the procedural and statutory requirements of CEQA, selecting the steeper slope/reduced earthwork Alternative 3 as the preferred project, and approving the Conditional Use Permit and Coastal Development Permit for the portion of the proposed Rincon Trail located in the City of Carpinteria. Commissioner Moyer seconded. Motion passed 3-1

by the following roll call vote: Commissioner Allen voted yes, Commissioner Moyer voted yes, Commissioner Callender voted no, and Chair Benefield voted yes. Chair Benefield announced there are 10 days in which to appeal to the City Council.

Dear Sirs,

Coastal soaring at Bates is unique and special for my family and i as we visit from out of town especially to enjoy the beach and the paragliding. We typically visit for a few days and stay in local hotel accommodations and also enjoy dining out at all the local restaurants. If it was not for the paragliding at Bates we would not visit.

Pls preserve this unique soaring site.

Yours sincerely,

Derek Arculli

Hi Nick,

I live and fly Paraglider's in SLO county and frequent the Santa Barbara area to fly often. Our membership in SLO is growing and many of us come down to SB to fly the various sites and get a bite to eat afterwards. We love our visits to Santa Barbara. Bates is a lovey site for us as it gives us options when conditions at other locations are not favorable. I haven't followed closely the changes coming to bates but I understand that it may limit or prohibit our access to a beautiful ridge on the California coastline. It is my hope that the city of Carpinteria will allowed continued access and support for our sport. Sites to fly are difficult to access and our options are constantly becoming more limited. I've flown all over the world and many places support and encourage paragliding. It is very visually appealing and residents frequently perceive it as a peaceful and amazing use of public land. You can ask the Chamber of Commerce of Morro Bay as they have used photos of paragliding as a means to promote tourism and demonstrate the beauty of the California coast in SLO county. I hope you can support our flying activities at Bates. I am happy to answer questions about paragliding and can direct you to local members who could help as well Thank you for your attention

Re: “Little Diamondhead”/Carpinteria Multi-Use Trail

Dear Mr. Bobroff,

The United States Hang Gliding and Paragliding Association (USHPA) would like to express our support, along with the Santa Barbara Soaring Association, for the City of Carpinteria Environmental Review Committee’s recommendation from April 13, 2021 that the Multi-Use Trail be placed on the freeway side of the bluff rather than the coastal side, thereby preserving the free-flight site of “Little Diamondhead,” also known as Bates Bluff.

The bluff in question represents a critical aspect of the hang gliding and paragliding communities in and around Carpinteria. Our sports are environmentally friendly activities that rely on natural cliff formations and air currents for pilots to remain aloft. They also have the lowest barrier to entry of any form of aviation, making birdlike flight available to the general public. Reliable, safe, and beginner-friendly flying sites like Little Diamondhead are exceedingly hard to come by, and the preservation of those sites is essential to maintain public access to free flight.

If construction of the Multi-Use Trail were to begin along the coastal side of the bluff, it would effectively remove not only the primary flying site for Carpinteria-based pilots, but also a famous ridge flying area whose smooth winds and steady updrafts make it ideal for both beginner and advanced pilots. Natural terrain, access issues, and wind direction mean that sites like Little Diamondhead could not be replaced easily, if at all, and its loss would deal a blow to the free-flight community across the country.

Any efforts to preserve this area for future pilots would be greatly appreciated by both the local and national free flight communities!

Thank you for your attention to this matter.

Sincerely,

Martin Palmaz

Proposed Rincon connector bike path

Message

My name is Tyson Blades and I am the manager of Velo Pro Cyclery in Santa Barbara. I and my entire staff would like to voice support for the proposed bike path connecting Carpinteria to the Ventura coastal bike path.
We are so fortunate to live on the South Coast. We can recreate all year round and enjoy the beauty and awesome weather. We here at Velo Pro ride the popular route from Santa Barbara to Ventura often. We love the fact that we can get between the two cities with relative ease.
The only problem is the section of the 101 that we must traverse in order to get to the coastal bike path. Riding along the 101, especially on a section where motorists often have trouble (or an unwillingness to) control their speed. The shoulder is also littered with objects which can puncture tires and endanger the lives of cyclists.
To rebut the soaring community's argument that the proposed path will change the wind patterns. There are already paths below the launch area which are frequented by hikers. To assume that the proposed path will change the wind patterns is mere speculation. The wind that the paragliders is not in any way perfect: it varies in speed and strength.
As for the argument that riding on the 101 is not that scary, I invite the soaring community to try and launch from the shoulder for a change. They will soon discover that doing any hobby less than 10 feet away from speeding two-ton boxes of metal is not enjoyable.
Let's all be good neighbors and allow ourselves to do our hobbies safely so we can all enjoy our coast.
Thank you.

Hello Mr. Bobroff

I'm wriiting in regards to the Rincon multi use trail. I strongly feel that the proposed project is to expensive, unsafe, and a poorly planned. The proposed trail would cost over $12,000,000, remove some 312 million lbs of coastal soil and dump cyclist straight into parking lot traffic. It would also ruin one of the only coastal soaring sites for paragliding and hang gliding in the county. I am 100% for connecting Carpinteria to Rincon with a trail described as the "Highway Adjacent Design."

I grew up in Carpenteria and graduated from Carpinteria Middle School, Carpinteria High School, and Brooks Institute of Photography.
My brother Nick Koepenick is one of the Captains of Carpenteria - Summerland Fire Dept and very active in the community. As kids we spent most of my time surfing, diving, hiking and fishing the coast here.

In August 2021 I started taking courses at Fly Above All Paragliding in Santa Barbara and acquired my P2 novice pilot certification in October 2021. I've since been able to Paraglide the Bates site now on several occasions. The flying has been incredible and the community is the strongest and most supportive I've ever experienced, especially in the Santa Barbara area.

I hope that the committee will reconsider there design and come up with one that is cost effective, timely, safe, practical, and enjoyable for everyone without ruining one of the hubs of our free flight community.

Removing 30% of the flying potential is the equivalent of dredging 30% off of the top of Rincon point to surfers.

People come from all over the world to surf, hike, and bike here.

They come to fly here as well.

Thank you for your time.

Subject: Rincon Trail

Dear Planning Commission Members:

Please approve the revised EIR for the Rincon Trail. This project has tremendous benefits for the region in terms of public safety and sustainability. The current status quo has lots of folks using the railroad tracks or the edge of the freeway as a coastal trail. Both of these activities are clearly dangerous. The proposed project will allow for a safe and irresistible trail experience that will serve for generations to come.

I am also wanting to bring attention to the questionable use of the area by parasailors flying just above and along the freeway, the railroad tracks and the county park. This would seem to me to be an unsafe practice and distraction to vehicle operators as this area in the past has been the site of major vehicle accidents (such as the semitruck and vehicle accident in 1970 where 11 people died).

In my opinion, the practice of allowing parasailing in this area would appear to be in conflict with FAA minimum altitude requirements. Changing this project to allow flying in the area only perpetuates an unsafe practice and distraction to passing by motorists.

Respectfully Submitted,

Warner R. McGrew

Carp Rincon Trail
Message
Hi everyone, I'm writing to express my support of the Rincon Trail Project. This addition to our community will be a much-needed improvement, and will be enjoyed and used by many. The connection between the end of Carp Ave and Rincon will make access much easier for thousands of families, walkers, cyclists, runners, surfers, etc. I really appreciate all the work everyone has put into this project to make the route safer for all. I understand there is some push back from the hang glider crowd about

the air flow being interrupted if the connector is built. The drawings that I saw showed the bridge quite a way past their launching point, so I'm not too sure that they're argument about the air flow interruption is valid. It appears that their launch area will not be impacted by the trail. I know you've done your surveys, but I don't see how a small handful of fliers can object to a trail that will be used by thousands of people, by using the "we were here first" argument. The few of them will still be able to fly, while many, many others will be able to enjoy the area.
Thanks for taking the time to read this. Please feel free to contact me if needed.
Thanks again, Bruce Davis

To whom it may concern,

I am writing this letter in an attempt to dissuade the development of the proposed bike path along the Rincon bluffs. I am not coming at you from a procedural and/or environmental impact point of view. I am certain that you are hearing about that from many others. Instead, I am asking you to reflect on the legacy and impact we want to leave behind. I am asking you to reflect on whether or not this is a project of pride and grandeur or that of practicality.

As you know, there are two groups that have issues with the proposed development: the Freeflight community and the Biking community. The Freeflight community is certain that this development will ruin their ability to soar the cliffs, which is both inspiring and beautiful to behold. The Biking community is worried about the safety of having a path merge into a parking lot (a very legitimate concern). Do those concerns not outweigh the community of people that are ardently in favor of this path? Although I'm not a religious man, I do believe that Pride can blind and lead us astray. Is this project a matter of pride or is it the will of the people? To me, it sounds like a plan that has become important to the planners and not something the community at large supports.

Also, as an environmentalist and somebody concerned about Climate Change, I believe we need to start asking ourselves a critical question: is this project a matter of necessity? If it is, then we should expend the resources to pursue it. If it is a project of luxury, then perhaps the way forward should be reconsidered so that we are using the least amount of resources possible. From an environmental standpoint, keeping the bike path on the road would require a lot less resources. Making the project more environmentally responsible. We need to change the way we make decisions and this is an opportunity to lead our community onto a more environmentally friendly path.

Again, I wonder and I hope you consider: is this a project of pride that is blinding the principal architects to the desires of the community stakeholders and citizens? Is it a project that could be accomplished with less negative impacts to our climate and physical geography? Do we want to start making decisions in our policies and projects that help to mitigate Climate Change? Do we want to create a legacy of environmental stewardship? I hope you consider your role in shaping our future. What legacy do you want to leave behind?

Thank you,

--

Subject: Save Bates Ridge

To whom it may concern,

My name is Shad Preston (USHPA # 81927) and I was born and raised in Ventura. As a child growing up my parents would often take me to Bates Beach to enjoy the beach, as well as watch the hang gliders who would gracefully and effortlessly soar the small cliffs above the beach. We were so memorized by it and often dreamed about flight ourselves. Many years later, my Dad learned to paraglide and would often enjoy flying for hours at a time at Bates. A year later back in December of 2003, my dad bestowed the gift of free flight upon me and I started paragliding as well. From then on, I also was able to enjoy the beautiful air that would blow into those bluffs above that beach at just the right direction with just the right amount of velocity. Knowing what is needed for free flight to take place at a ridge soaring site, makes Bates Ridge an exceptionally special place for our peaceful and quiet sport. The ocean breeze sets up perfectly on certain days and allows many, many pilots to enjoy this special gem along the Southern California coast and is a very rare spot as there are not many locations that are as ideal as Bates Ridge.

It would be a terrible loss if Bates Ridge were to be carved down changing the coast line forever and doing away with a long standing and historic free flight site, simply to put a short bike/walking path. There is an obvious alternative by constructing the path behind Bates Ridge closer to the freeway. This would allow for a safe location of the path and would allow free flight to continue without changing the geography of the coastline forever. Any other decision is simply reckless and unnecessary. DO NOT construct the bike path on the train tracks side and ruin the ability for free flight to continue in Ventura County and at Bates Ridge.

Thank you,

Shad Preston

To whom it may concern,
I am writing to ask that the City only support Alternative 4 of the EIR which places the bike path on the north side of the bluffs. This is clearly safer, less expensive, and will preserve the current use of the site as a recreational flying location. Any other option is a threat to the environment which will not only draw the ire of anyone who values the beauty of our precious coastline, but will also likely delay the project further and make it even more expensive.

Please only consider alternative 4.

Sincerely,
Dietrich Schuhl

Dear Nick, and the City of Carpinteria Planning Commission,

I'm writing on the January 18, 2022, Planning Commission meeting agenda item 2, Rincon Trail, Project # 19-2015-CUP/CDP.

The proposed final Environmental Impact Report, December 2021, for the Rincon Trail does not accurately account for its impact on recreation, increase in hazard at the eastern terminus, and negative impact on the view-shed. The EIR should not be certified without further amendment.

I appreciate that a wind study was conducted and I differ on the conclusion stated in the EIR: carving out a level trail will result in a substantial decrease in soaring opportunities along that length of the bluff.

I would also counter that the Project is not consistent with Coastal Act Section 30251 as long as it involves extensive earthwork on a south-facing bluff that is already subject to erosion.

The EIR asserts that the Project is consistent with Coastal Act Section 30251 because the trail itself will be a "subordinate feature." Schematics and drawings do not show the fencing that would be put up for safety, and the fencing will forever mar the view. The trail will definitely not be a "subordinate feature" once fencing goes up.

A City consulting traffic engineer "determined that there would not be a significant hazard associated with introducing additional cyclists traversing the Rincon County Beach parking lot." This determination defies common sense. The City's response mentions signage to mitigate {the additional risk} and to get cyclists' attention to slow down. The reality is that most cyclists enjoy picking up speed going downhill, and now this is to happen in a parking lot. Along with the fencing, the signage will be more still blight that mars the natural beauty of the beach.

While the Planning Commission may certify a flawed EIR on January 18, 2022, the EIR is not worth the paper it's printed on until it accurately accounts for the impacts to recreation, the hazards associated with introducing cyclists to a parking lot, and the ugly prominence it would have on this short stretch of the coast.

The Planning Commission has a responsibility to steward public resources, including the current and future use of the bluffs at Rincon. I'm not in favor of the Planning Commission's approval of the Conditional Use Permit and Coastal Development Permit for the proposed Rincon Trail. Alternative 4 on the north side of the bluff would preserve the ridge for flying, be safer for trail users and lower impact on the coast.

Thank you for your time and consideration.

RE: Rincon Trail Project 19-2015-CUP/CDP

AKA: Multi-Use Trail (M.U.T.), Bluffs Two Trail

Dear Commission members,

The request for a Conditional Use Permit and Coastal Development Permit for this portion of the Multi Use Trail, Rincon Trail Project should be denied. The Environmental Impact Report (EIR) should not be approved. The petitioners have not indicated a readily available source of funding for this portion of the Multi Use Trail or the entirety of the project. There has not been a public cost estimate submitted for this portion of the M.U.T. The foundational easement, north of Carpinteria Avenue and south of the southbound US 101 onramp at Highway 150, has recently been built (within the last 10 months), without a Conditional Use Permit or Coastal Development Permit (see attached photos 1,2,3).

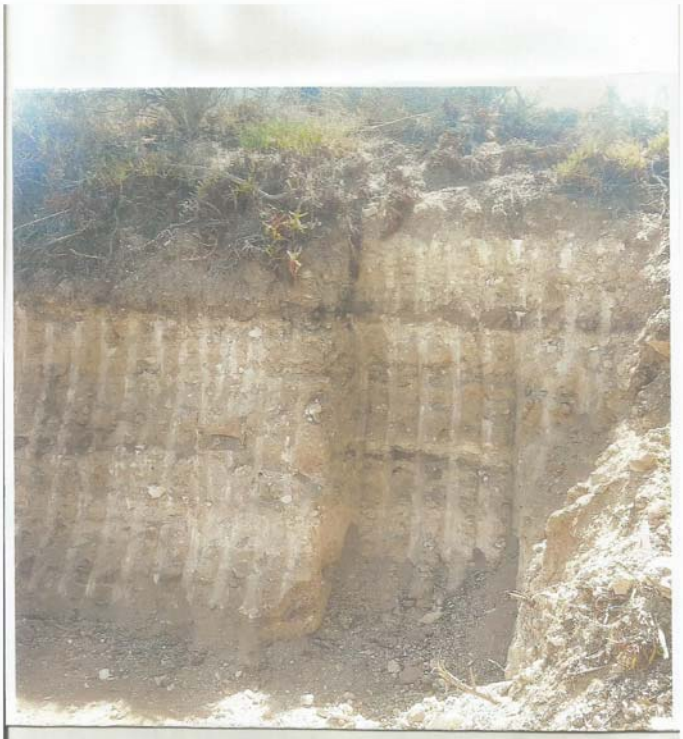
The City's Architectural Review Board in their recent meeting on October 28, 2021, approved the concrete design of "…800 feet…, twelve feet wide… with no safety railing…" of the M.U.T. in the City's "purview." It was not discussed, as to what the depth of this portion of the M.U.T. would be. The Board continued to talk about design elements of the whole M.U.T., without allowing public comment or questions. The existing bike path width in this area is approximately fourteen feet.

The proposed (2005) M.U.T. is a project that is 17 years overdue. It encompasses several jurisdictions and agencies and should not be constructed in a fragmented way. Construction, once approved and budgeted, should commence at the same time, for the entirety of the project. This will ensure that a cohesively engineered, designed, and developed project may be reliably and consistently and safely completed.

The City's current proposed plans show that the Union Pacific Railroad bridge, be angled at ninety degrees, to the tracks. This creates a "Dogleg, "on the M.U.T. which juts out toward the

Pacific Ocean and may require stanchions (described in earlier presentations but not illustrated or listed with cost estimates). This alignment is not sustainable or direct, and according to the City's Environmental Review Committee (April 13, 2021) not the "Environmentally Superior Alternative." The Environmental Review Committee would like to see the bridge over the UPRR in line with the southbound US 101. There has been no public cost estimate for straightening out the "Dogleg," of the M.U.T.

The Environmental Impact Report does not accurately reflect the drastic impact to orographic lift for the primary recreational users of "Little Diamondhead," the paragliders and hang gliders of the Santa Barbara Soaring Association, and the United States Hang glider and Paraglider Association. The Bluffs Two easement is a part of the entire project and should not be approved or continue to be built. The city requested on December 16, 2021, at the SBCAG meeting, an additional $300,000 to complete the EIR. The funding was not approved at that time. The December 2021 ETR cannot be accepted as it was not completed at that time. The "No Confidence," option should be used.



Respectfully,

Ottis Gillespie

Subject: Agenda item #2 / Rincon Multi use trail proposal

I strongly oppose the spending of $16 million on the construction of a bridge to carry cyclists and pedestrians into the upper Rincon parking lot. That amount of tax payers dollars can be spent in soo many better ways. I have read the alternate proposals and they are significantly cheaper and all around better.

Linking the bike path from SB to Ventura is a great idea, but $16 million dollars for a pedestrian bridge?

That route will be dangerous. Why not use the north side of the hill and feed cyclists into the existing bike path entrance that parallels the 101 south? Please consider what will happen on a busy summer day when that upper parking lot is

packed full of beach goers, entering and exiting that parking lot. It's already congested, now add pedestrians, cyclists, scooter riders, e-bikes funneling into the parking lot!

Thank you for your time,

Ian Higgins

Subject: Public comment regarding the proposed Rincon Trail

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Dear officials and representatives of the City of Carpinteria,
My name is Derek Musashe, and I am the Vice President of Paragliding for the Santa Barbara Soaring Association (SBSA) and a longtime Santa Barbara area resident.

I am writing this public comment in reference to the Rincon Multi-Use Trail Project and it's EIR and coastal permitting that I believe will be discussed as agenda item 2 in your January 18 meeting.

For the last several years, the vibrant and growing free flying community in the Santa Barbara and Carpinteria area has been fighting to protect an irreplaceable coastal soaring site at the Rincon bluffs (also known as "Bates") from being destroyed forever by an ill-conceived routing plan for a new bike path.

From the very beginning we have been in full support of a bike path, but we would like one that will actually be cost effective, have a minimal environmental impact, and won't completely destroy our cherished flying site at the Rincon bluffs which bring in countless local and visiting pilots each year to fly there.

The current routing option being put forth by Matt Roberts (from Carpinteria City Parks and Rec) and others will:

- Remove 312 million pounds of soil from the slope, never to be seen again.
- Cost at least $12-16 million for just a quarter of a mile of pathway (that's over $11,000 per foot of bike path).
- Funnel cyclists into a busy and steep parking lot, which will cause many future accidents and injuries to both cyclists, pedestrians, and drivers alike.
- Forever alter the Rincon bluffs and their ability to redirect wind for soaring purposes of free flight pilots and coastal soaring birds alike.
- Be much less durable over time than other alternatives that aren't on the oceanside of the Bates bluff (aka Little Diamondhead)

The current design is already over budget by 200% and is 20 months behind schedule. The reasons for this are myriad, and Matt Roberts and company will blame external parties, like the free flying community. Still, the fact of the matter is that this is simply an ill-designed routing plan for the bike and pedestrian path, putting it on an unstable slope that will need to be heavily reinforced at huge taxpayer expense. This is why the current plan is faltering.

Myself and over 2,800 other individuals have signed a petition to preserve the south side of the Rincon bluffs. I am not alone in this. The outcry from our community is palpable, based on our very real fear of losing a treasured flying site that we have been lawfully flying at for over 40 years.

My ask of you is quite simple: support building a better bike path with a different routing. Do not fund the current iteration of the plan. Demand a better path for both taxpayers and the path users alike!

A preferable routing on the north side of the bluffs was already identified and presented as "Alternative 4" in the Environmental Impact Report. This design will be easier to build and will cost a fraction of the current proposal, all while preserving the bluffs that the free flying community so cherishes and giving cyclists and pedestrians an even safer bike path than what is currently planned (it will no longer need to be routed through the busy parking lot).

This project has run into so many issues and so many cost and time overruns not because it's a bad idea in principle, but because the current routing and design are simply not very well thought-out.

You have a chance to help us fix this, and make a better bike path in the process. I hope you support us in this, and in turn, we will fully support you.

As it stands, our flying activities at the Rincon bluffs is a protected recreational activity under the California Environmental Protection Act (CEQA), yet the Environmental Impact Report did not properly address the current plan's impacts on this recreation. As such, we plan to exhaust all of our legal and political options in addressing and rectifying this egregious oversight. On the other hand, simply changing the routing of the path will resolve all of these issues.

Again, I hope you can support a better bike/pedestrian path than what is currently proposed. If you can, then we will all be allies in making this multi-use path a reality. If not, then you risk needlessly wasting taxpayer money, endangering cyclists and pedestrians for the life of the path, and engendering anger and ire from your constituents for decades to come.

Thank you in advance for reading this and for your support.

Sincerely,
Derek Musashe

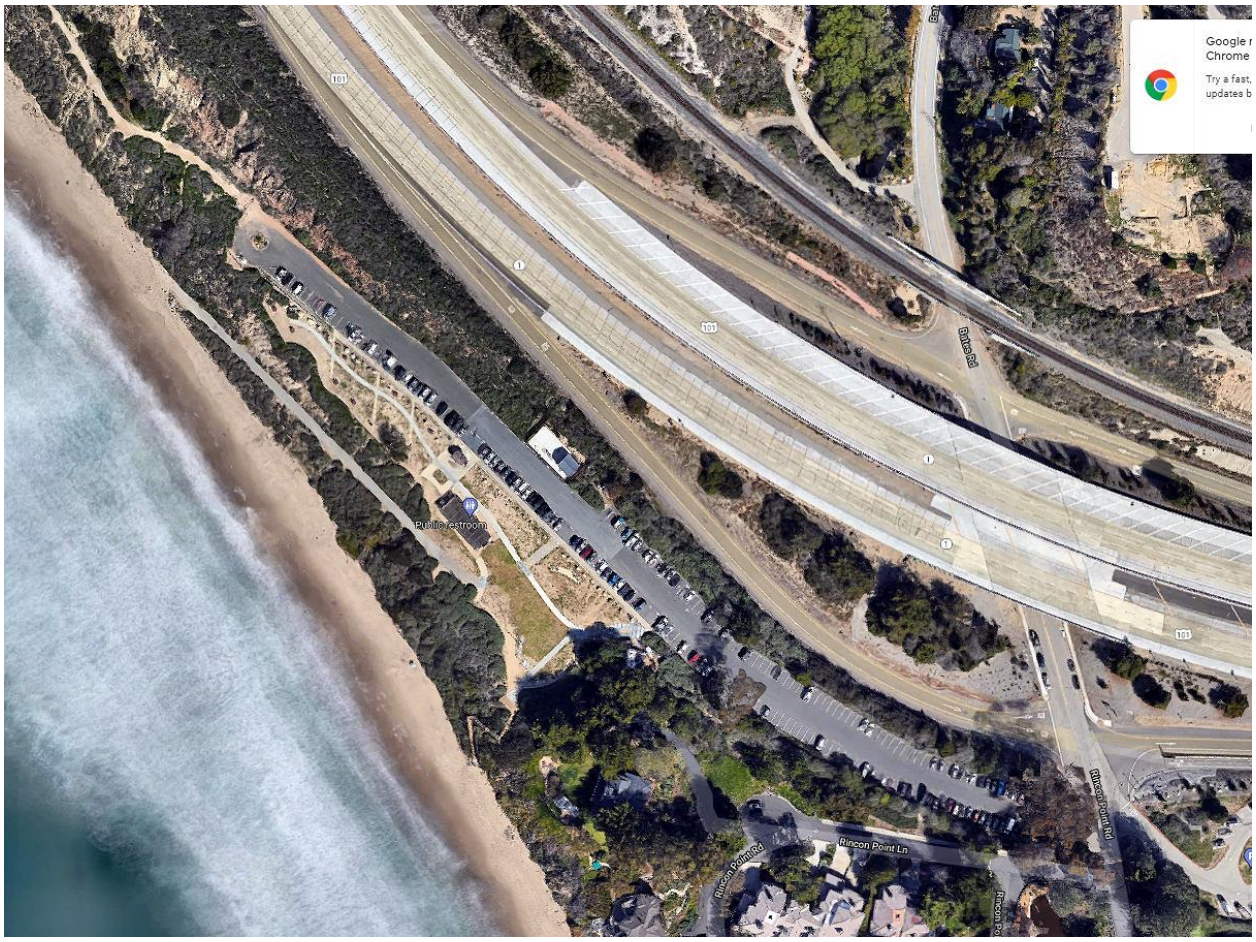
Re: Rincon Trail

Dear Mr. Bobroff:

Thank you for this opportunity to address the Carpinteria Planning Commission as they consider the revised EIR for the proposed Rincon Trail link between Carpinteria Avenue and the Ventura County line. I attended previous meetings and testified about my concerns of the Alternative #3 terminus at Rincon County Park, and I read the revised EIR Report and its accompanying exhibits. I wish here to express my continued concerns about the Trail terminus not mentioned or given, in my opinion, short shrift in the updated documents in front of the Commission.



1. We are disappointed that the removal of the concrete debris (what the EIR calls "brik brak") that has fallen from the old railroad bench to the beach below will not be removed as part of this project. This concrete is not only unsightly, it also provides an unsafe path (although not an easy one) to the old bench above that runs parallel to the railroad track as an alternative for hikers to reach the parking lot at highway 150 to the west. We see people using this path every weekend. One of the selling points of the new Trail was to eliminate the safety hazard of hikers walking along the railroad track. In the original proposal, the bench in this area was to be filled in and the debris removed that would permanently remove its accessibility. I don't know how much more this will add to the cost of the project, but we ask that this be task be added back into it. We do not think the cost will be that great since all the earth moving equipment will be close by and available anyway.

2. We are also disappointed that the EIR fails to suggest mitigation remedies to the dangerous termination of the Trail into the Rincon County Park parking lot. This 150-car lot is not ADA compliant as it has a very steep angle of descent from the parking area down to Bates Road and the start of the Ventura County bike trail below.

   As you can see in the attached Google photo of the Rincon parking area on the next page, the lot has poorly designed sight lines for cars trying to pull back into traffic when leaving their parking spots and we constantly see close calls with other cars using the lot. We also have observed many bicyclists using the existing bench trail (along the railroad track) and travelling at speeds through the parking lot that make it almost impossible for them to be seen by cars pulling out of their spots. The width of the lot is only about a car's length behind any car exiting a parking spot and a car had to pull out about halfway for a driver to safely see and cross traffic to the left or right. During the summer there are many close

calls as the lot is too narrow for a large amount of car and bike traffic both dueling for the same space. Adding an estimated 70,000 bikers each year to this path, as estimated by the EIR, is surely a tragedy waiting to happen.

At the ARB meeting several months ago, there was a discussion about creating a designated bike path through the parking lot. The answer I received last April stated the following:

> *City's consulting traffic engineer determined there would not be a significant hazard associated with introducing additional cyclists traversing the Rincon County Beach Park parking lot. Vehicle maneuvers in the parking lot involve low speeds, and signage in the parking area would alert drivers to cyclists passing through the area. Signage at the terminus of the trail leading into the parking area would also alert cyclists to reduce speed and employ appropriate caution when riding through the parking lot.*

I respectfully submit that this this consultant is wrong. I don't know what data he used to reach his conclusion but anyone who has seen the lot knows this is not a viable option. Bike riders are notorious for not slowing down nor stopping unless they have to. Inevitably, there will be collisions.

A designated path on the north side runs into the sewage treatment building about 30 cars later. The hill behind would have to be cut down to accommodate a safe designated path, and that is not in any of the EIR alternatives. Or…

It was suggested at the Architectural meeting that perhaps there could be a designated bike path parallel to the parked cars on the beach side. Unfortunately, this will be an unsafe lane to cross for beachgoers and families and dog walkers traversing the path from their cars toward the beach. Also, this path only

works for about two-thirds of the parking lot. The last third of the lot runs downhill at an angle that is not ADA-compliant. There are bound to be collisions at the bottom of the hill despite there being a stop sign there as riders try to cross Bates Road toward the completed Ventura bike path across the street. Those with disabilities travelling the Trail will have trouble controlling their speed going down this hill. It is the parking lot itself which is the problem and there is no way that I can see to integrate it into the planned coastal path. Or…

Part of the berm on the north side of the parking lot is cut so that a path allows the bikes to transfer to the freeway side of the parking lot parallel to the Bates Road offramp. This will be at a much safer angle of descent than the parking lot as bikers continue toward the Ventura pathway.

But then, if we do that, then we might as well accept the Alternative #4 for the entire bike path since it stays on the freeway side for its entire length and exits at the bottom of the Bates offramp. The argument that it is not ADA compliant is rendered moot if you take Alternate #3 instead since it accepts the non-ADA compliant and unsafe hill in the parking lot as the terminus of the proposed Trail.

Last April, the Planning Commission rejected this same Alternative #3 path because of safety concern at the parking lot. The reply I received to my January letter to the Commission casually said the parking not was not part of the project and therefore not important to the EIR. The Architecture Committee members agreed that any Trail proposal has to consider what is going on at the start and at the end of the proposed Trail.

I respectfully request the Planning Commission reject the staff report (as it did last April) and instead approve the inland route (Alternative #4) for the Rincon Trail. I think our organization as well as the community at large agrees a Trail is a necessary and welcomed addition to our community. Don't make the mistake of choosing the wrong path. Do the right thing.

Sincerely,

Gary Mussell,
Director, Friends of Bates Beach

TO: City of Carpinteria Planning Commission January 17 2022

RE: Agenda item #2 Rincon Trail Project

I am writing to offer information and opinions regarding the proposed Rincon Project and the intended alteration of the landscape to extend a bike path into the area in question. My interest and qualifications for commenting here are two-fold: I have been a hang glider pilot for 48 years and a paraglider pilot for 32 years. Also, utilizing my degree in engineering and physics, I studied micrometeorology intensively and wrote the book Understanding the Sky, which is used in many forms of aviation and is quoted in your EIR proposal. In addition, I wrote the book Art of Paragliding, which is also referenced in your document.

To begin, I have examined the various graphs and equations and find them to be reasonable and accurate, except for a few caveats, which I shall list and address below.

1. The most important misconception in this EIR analysis is that it is limited to two dimensions. In other words, it only looks at the vertical and incoming flow of the air. However, we all know that the flow of air is so fluid that it moves in all directions—forward and back, left and right and up and down. Because this site is limited in its width with respect to the incoming wind (perpendicular to the slope face), there will be some flow moving slightly sideways to escape into the opening or gap near the railroad tracks as a result of the extensive excavation needed to connect the bridge to the path. We can visualize this phenomena by thinking about a rock in the middle of a fast flowing stream. In this case we will see a bit of pile-up of water in front of the rock, while most of the water splits to flow around either side of the rock. The air flow around a protruding hill is nearly identical to this observed water flow. Figure 1 illustrates this effect.

   If we further visualize a broader rock or perhaps a short wall perpendicular to the water flow, we will see that there will be more pile-up of water in front of the obstruction (wall), while there is still plenty of water that escapes around the sides of the wall. In the free air flow the wall is analogous to a ridge as opposed to a single hill limited in width. It should be clear that the wider the obstruction, the more it presents lift in front of it, and the smaller the percentage of flow that escapes around the sides compared to the total volume of flow meeting the obstruction face.

   This natural behavior of water and air means that any alteration in the width of the small ridge at this particular soaring site will render it less soarable and undesirable as a flying site. In fact, it may become non-soarable except in a perfect wind direction (an infrequent occurrence at this site) or higher winds, which increases the inherent dangers. Not only is the lifting area reduced, but the increased flow into the proposed larger gap near the RR tracks will make it harder and more dangerous to cross the gap to reach the higher, more soarable area of the ridge. It should be noted that all craft operating in a fluid (boats and aircraft) must point a bit into the flow in order to move in a direction crossing the flow. With a higher wind flow in this gap, the crossing will be slower and may not be possible at all if the glider's energy and altitude is expended in countering this increased air flow. Figure 2. Illustrates this matter.

Another factor that the three-dimensional flow introduces is that lift is reduced due to some sideways flowing of the air. So while the diagrams presented in the EIR purport to show a 10 to 20% reduction in lift, it will be a greater reduction if any amount of the ridge width is reduced. In other words, the graph presented are not representing the true effect of the proposed alteration of this site. When air flows faster in a constricted tube or through a narrow gap, it is known as a venturi effect. Pilots learn to avoid venturis because of the inability to penetrate against them and the possibility of stronger and even dangerous turbulence. This result is similar to an airplane flying into a jet stream with its extremely strong flow and often strong turbulence.

It is curious to note that while the EIR refers to many illustrations from my books, it does not reference any top view (plan view) illustrations, which provide the most meaningful understanding of the wind flow. For example, figures 13-7, 13-9, 13-10, et. al. in The Art of Paragliding clearly present the wind's behavior in gaps and along ridges. It's as if the analysis of a building's structure was presented only as side view elevation, without any top (plan) view or front elevation view. The limited information may be accurate, but is inconsequential in light of the need to fully understand the structure.

2. An additional error in the EIR is not taking into consideration the effect of wind gradient. The wind gradient is shown in the left vertical graph in figure 1 of the EIR. It shows the normal situation whereby the wind flow is slowed near the ground and increases as elevation increases (this slowing is due to friction and drag of the ground itself and ground objects, such as rough terrain, bushes, rocks, etc.). In brief, the wind gradient actually reduces the amount of lift created at the top of a slope—the greater the gradient, the less lift. What isn't mentioned in the EIR is that the flatter the slope, the thicker the layer of reduced flow is, so more lift is lost. As a side note, much of the lift at this site gets a boost from the heating of the beach area below. This heated air joins the general flow up the slope and makes it more buoyant. But with a flatter slope the rise of the buoyant air is not added to the general uplift as much because it tends to sidle along the surface rather than lift off due to the inertia of its mass (air weighs a surprising 0.08 lbs. per cubic foot). Thus, we can conclude that reducing the steepness of the slope will reduce lift more than the projected 10 or 20%.

3. The next point of concern is the added wind speed and turbulence caused by the alterations proposed. First, it should be pointed out that hang glider and paraglider plots would have to fly in the area where turbulence can form and pass through as a result of the bench cut into the bluff for the path. Thus they will experience ground turbulence. An increase in this turbulence will increase the dangers. The statement in the EIR that increase in turbulence shouldn't be a problem was probably influenced by the opinions of sailplane pilots who can handle stronger winds and turbulence due to their aerodynamic controls. In fact, in my experience throughout the world, I know of only two places that sailplanes take off close to the ground at the top of a ridge. Because hang glider and paraglider pilots must take off right at ground level, it should be clear that *any* added turbulence at this site can be life-threatening.

   The EIR illustrates what appears to be a large eddy (swirl or rotor) at the bench area in figure 1 on the right side. This eddy is assumed to remain there out of play of the pilots launching or

flying near the slope. However, experience has shown that such an eddy only remains stable in lighter wind conditions when the wind is fairly perpendicular to the bluff face. In other conditions, the eddy can break away from its position at the bench, travel up the slope and become a serious hazard before it drifts downwind and gradually diminishes. In other words, the current profile of the slope presents a small eddy from the old RR bench that must be considered and countered by pilots flying at this site. But if a wide bench is created higher up the slope, or if the slope is reduced, the frequency of eddies impinging on the site will be increased, first by the deeper and higher bench resulting in more eddies, but more importantly by the fact that a lesser slope makes it easier for the eddy to break away and travel downstream, since it doesn't have to climb as steeply and do work against gravity.

4. Finally, it should be noted that the EIR references studies done in wind tunnels mainly as well as studies conducted by pilots from the sailplane community. Much of this data doesn't apply in the real world where matters can be and are often different than the closely controlled laboratory (as actually noted in the EIR). In fact, the best empirical data comes from the tens of thousands of flights conducted at this very site and more importantly from the hundreds of thousands of flights experienced by pilots of all sorts at many sites around the world that are very similar to the Rincon bluffs. Most pertinent to the point is that pilots of these small aircraft can fly very close to the terrain and gain much experience relating to the air flow and turbulence effects in real situations that cannot be duplicated in the laboratory and cannot be acquired any other way. So it is hard to understand why the local hang gliding/paragliding community wasn't consulted when this analysis was created. It would behoove all involved to proceed with this liaison in order to get a clear picture of the effect of the alterations and to understand how much the reduction of lift will diminish the possibility of this form of recreation.

Respectfully Submitted,

Dennis Pagen

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Dear Planning commission and Honorable County commissioners, this letter is in regard to the proposed new bike path located south of Carpinteria at the Bates exit.

As a part-time resident and full time tax payer of the dynamic and peaceful town of Carpinteria, and being a avid outdoor enthusiast who road bikes the coast particularly the stretch between Carpinteria and Ventura along with other sections up and down the coast. I also am a paraglider pilot and who lives and works on National Forest Lands making me intimately familiar with the NEPA process in which many stakeholders and there diverse perspectives are brought together in which if done correctly almost always results in a better project .

I thank the planning commission for embarking on this arduous and and sometimes thankless task , and in providing the following comments I have tried to be objective and if not entirely so at least use the test of empathy in my comments.

1. Whenever a proposed project involves a “TAKE” that compromises the other users, environment , or wildlife particular attention should be spent in the planning process as once put into action a controversial and misplanned project can negatively affect a community for years or decades to come.

Regarding the Proposed Bates - Rincon connector trail. The biggest concern is that of moving too fast towards a plan that clearly would be considered a “TAKE” in this case one that would alter the Iconic ridge soaring site that has become part of the community both for paraglider pilots and for the larger recreational users of the coast that have become accostumed to seeing this beautiful and inspirational form of flight. As a avid bicycle rider I BELIEVE IT WOULD BE A SHAME TO TAKE THIS AWAY just in order to put a bike path that clearly can be located in a manner as to NOT EFFECT the community of flyers that inhabit the sky above Bates.

2.As a bicyclist that loves riding down the coast having a bike path that could be located on the NORTH side of the ridge would be a great way to connect with the existing path that continues south to Ventura, and in this day of needing to at least begin thinking about the environmental consequences regarding the climate , moving 312,000,000 lbs of soil which would entail 5000.00 trips along with the enormous amount of associated dirt work in a controversial and misguided design does not represent the best plan that could be engineered and constructed. If PUSHED THRU this project will make a travesty of the PUBLIC PROCESS.

3. In this day of excessive overblown government spending some serious thought as to the effective use of taxpayers dollars should enter into the planning process, it is not good enough to say we have the money and to just FORCE FEED A PROJECT, it should be the job of the planners to say how can this be done for less, allowing room for other much need projects to take place. PLEASE BE AWARE OF YOUR FIDUCIARY

OBLIGATIONS TO YOUR CONSTITUENCY, and given the controversial nature of this project look for more economical and practical options (alternative 4).

Again I thank you for reaching out and I believe that if you use the test of empathy and remain openminded and thoughtful a better plan will arise. One in which all STAKEHOLDERS CAN BE PROUD OF.

Sincerely ,

Davey Pitcher

Subject: Rincon Trail Carpenteria

Dear Government Officials:

This project is 20 months behind schedule and has ballooned to a cost of $16M for 0.2mi of path. It will remove 312M lbs of soil in 5,000 truckloads, leveling the iconic ridge at Bates. The anticipated 100,000 trail users will be dumped into the already overcrowded Rincon Parking Lot with no plans for traffic management.

I want a bike path, but one that is built on the North side of the bluffs because it is safer and more direct for cyclists, and it is less environmentally damaging.

Sincerely,

Betty Winholtz

To whom it may concern:
I have been flying paragliders at Bates Ridge since 2013. I have had countless magical days at Bates, whether flying in the air, walking my dog on the bluff and on the beach, or just hanging out with friends waiting for the wind to be just right. This place holds a special place in my heart, and is such a unique location for flying and other recreational activities on the coast. I am also a biker and value bike paths and recreational trails of all sorts, but it is important to me that all users are taken into consideration. In addition:

-I want a bike path, but one that is built on the North side of the bluffs because it is safer and more direct for cyclists. The current design dumps bikers into a crowded and steep parking lot.
- I want a bike path that is better for the environment. The current design excavates and hauls away 312 million lbs of soil, which is upward of 5,000 truckloads. Forever altering the coastline.
- I want a bike path that is less expensive. The current project is estimated to cost $16 million for 0.2 miles of path, that's $16,000 per foot! It will drain capital resources for the future.
-I signed a petition with 2,800 signatures because I want to see the south side of the ridge preserved for the historic flying that happens there, which has existed for over 40 years.
- Flying at Bates is protected recreation under the California Environmental Quality Act and has not been properly addressed in the EIR, there will likely be more project delays because of this.
-The project planners haven't been listening to community groups and have tried to skip steps. The flying community for example has 1,000 local members who want to see a better design.
- The Environmental Impact Report presents Alternative 4, which will build on the North side of the bluffs. This design will be easier to design, cost less, be safer for bikers, and better for pilots.
-The planners have used up their time and money, causing the project to risk losing its grant. We should not be forced to rush now because of their unfeasible design and slow progress. If the project needs to reapply for an ATP grant, it is the fault of the planners, not community groups.

I urge you to reconsider the forward progress of the Rincon Trail project and to consider all recreational user groups as plans move forward.

Thank you for your time,
Rebecca Bredehoft

PLEASE Reconsider on the proposed trail system. I'm an avid paraglider who frequently travels to Southern California for the purpose of flying at sites like and including Bates Bluff. The proposed rincon trail system sounds terrible, unnecessary, unnatural, environmentally devastating, and it ultimately will ruin this historic paragliding location. We've been flying here for 40 years - why can't we preserve that while providing updates and access for more people instead of ruining the historic use?

I truly believe updates and new trails could be put in that not only improve this area for hikers, walkers, and bikers, but include the paragliding and hang gliding communities that have treasured this location for decades. This site is special and there are very few like it in the world left! People travel to this site every year due to its ease of use - it's a great place for beginners as well since it's a very safe and easy place to paraglide. Maybe a future plan could capitalize on the uniqueness of this site and make it an even better place to fly AND do other activities? If we work together, we can make this site accessible and better for everyone. Free flight is a huge draw and is booming lately. Look at cities that have embraced the free flight community like Boulder and Golden in Colorado and the Salt Lake / Draper area - they have had tremendous growth...

PLEASE

My wife and I enjoying the Bluff after a soaring session^

Please save Bates Ridge. It is a unique and inspiring site in which you can hike and see the colorful paragliders flying with the ocean as a background. And surely a *natural* trail shouldn't require so many truckloads of ground to be moved.

Respectfully,
Dmitry

Greetings,

I want a bike path, but one that is built on the North side of the bluffs because it is safer and more direct for cyclists. The current design dumps bikers into a dangerously congested and crowded steep parking lot.

I want a bike path that is better for the environment. The current design excavates and hauls away 312 million lbs of soil, which is upward of 5,000 truckloads. Forever altering the coastline aerodynamics. Think, also, of the needless C02 produced by those giant vehicle's proposed activities.

I want a bike path that is less expensive. The current project is estimated to cost $12 million for 0.2 miles of path, that's $12,000 per foot! It will drain capital resources which may have more utility in the future.

I want a bike path that has a chance of being built. This design is already 200% over budget and 20 months behind schedule with 65% of the remaining tasks rated at HIGH RISK of not finishing.

Pouring more money into this project isn't the way to get it done. A better design is needed. Extensive crony capitalism at play here needs to stop.

I signed a petition with 2,400 signatures because I want to see the south side of the ridge preserved for the historic flying that happens there, which has existed for over 40 years.

Flying at Bates is protected recreation under the California Environmental Quality Act and has not been properly addressed in the EIR, there will likely be more project delays because of this omission.

The project planners haven't been listening to community groups and have tried to skip steps. The flying community, for example, has 1,000 local members who want to see a better design which does not degrade the flying experience.

The Environmental Impact Report (EIR) presents Alternative 4, which proposes a construction on the North side of the bluffs. This design will be easier to build, cost less, be much safer for bikers, and better for pilots.

The planners have used up everyone's time and money, causing the project to risk losing its grant. We should not be forced to rush now because of a hasty and forced unfeasible design and slow progress. If the project needs to reapply

for an ATP grant, it is the fault of the planners, not community groups which should have been a part of the planning from the onset.

Thanks!

Rich Graham

RE: item number 2 Rincon trail project. 1-18-2022

Dear Carpenteria Planning Commissions

When you vote on this project this evening please apply the same level of due diligence that you have utilized in the past for other projects and please do not just rubber the in-house planners recommendations.
I seriously doubt that you would approve a project from a private developer that involves so much excavation without fully understanding all of the consequences of your decision.
The history of your prior decisions indicates that you don't normally approve projects with so many un-met conditions of approval. When a private developer promises to complete required conditions, do you normally just trust that the developer will complete the required conditions after the permit is issued.
Where is all the excavated soil to be placed?
Where is the native plant restoration location.
Bengal engineering says that they need a construction easement for in order to build the trail. Has this been acquired?
Are you going to trust staff's recommendation that the EIR is complete when it does not include the latest data regarding coastal erosion? Erosion that would require the need for the path to be moved inland in a just few decades!
Do you think the EIR is accurate when it fails to understand and describe how the project will affect the historic local soaring bluff? Please take the time to read the response to the EIR's air flow study from Dennis Pagen within the responses for this meeting, and do not vote to approve unless you **really understand** how this is going to affect the soaring community.
Thank you, John Greynald 805-886-6160

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

Good morning all,

I am a 5 day a week cyclist and sitting board member of the Santa Barbara Soaring Association. I would love to see a bike path built at Rincon, but I would like that bike path to be built on the north side, connected to the highway. The current design seems to prioritize a glamor project at the cost of cyclist safety, and multi-decade long paragliding and hanggliding location, and I honestly feel it is going to be an ugly urban path in a currently naturally looking habitat.

Almost once a week I do the trip from Santa Barbara to Ventura on my bike, and would love to see this bike path built--just not in its current design. The current design is dangerous and does not consider cyclist safety. Honestly, if this path is built, most cyclists will still take the highway because it will be more convenient and it's perfectly safe. Why would I take this path and risk my life in a parking lot when the highway is a direct path with a 10 foot wide shoulder? Even without a bike path directing cyclists into the parking lot, cyclists have been injured here many times before. Imagine what will happen if the supposed 100,000 annual users of this bike path are routed through the parking lot. It truly doesn't seem like the planners of this project have heard the opinions of the supposed people who will use it most.

Another reason I am against this project is I hold the free flight community near and dear to my heart. I was an avid paraglider for 5 years, and as I mentioned I still sit on the local board of directors. Even though I rarely fly anymore, I see it is a shame that this project has had little consideration for the impacts to the free flight community who have utilized this site for many decades. The community has shown support by having a petition with 2800 signatures against this project, which, considering how small our community is, is a seriously significant number of pilots.

The pilot's main concern is the steepness of the bluffs. As someone who is currently doing their Phd in computer modeling, no model will be able to reasonably predict the changes in airflow due to the number of complexities involved. Therefore, planners must rely on those that know it best--the pilots. As someone who has flown bluffs many times, pilots are always aware of many environmental factors, the most important being the slope angle of the bluff, because any little difference in these can significantly change the amount of lift, and whether or not a site is flyable. The current plans are ambiguous in how much the slope will change, but one

thing is for certain--the amount of grading required for this project will forever change and very likely ruin free flight at this spot forever.

Another point is that: an often upfront justification of this project is the instability of this slope. My question is what part of the coastal cliffs are stable? The entire coastline is unstable, and the stability of the slope is therefore a mute point whose sole intention is to tip the scales in favor of this project.

Finally, I think the project is ugly. Even though the bluff isnt "natural" anymore, to the common beach goer this bluff looks just as natural as its surrounding environment. Putting a path in and grading/armoring the entire slope is going to be an ugly eye-soar in what is a beautiful natural coastline. I truly cannot see one reason to make this path other than it will look good on a brochure for the City of Carpinteria. For these reasons, and my reasons above, I am adamantly against the building of the th Rincont Trail Project on the south side of the Rincon Bluff. However, being a cyclist who uses this path often, I would love to see a path built elsewhere.

Sincerely,
Christopher

Nick Bobroff

Subject: Rincon Trail Project

****EXTERNAL EMAIL****

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

We're writing in support of the Rincon Trail Project.

Having lived in Carpinteria for nearly 4 decades and having raised a family here, we have come to appreciate the value of public access to nature, especially the undeveloped coastline. That's why we supported the Bluffs acquisition in the 80's and rejected the more recent Paradon project.

This access to nature will be enhanced immensely by the construction of the Rincon Trail and the connection it will provide between the Rincon Bike Trail and the outskirts of the City of Carpinteria, while linking two coastal counties. Eventually this trail will connect through Carpinteria and on past the Salt Marsh to Padaro. What foresight and vision its creation will show to generations to come!

Unfortunately, like all attempts to rightfully claim public access to public resources, this project is threatened by a small, vocal group arguing against it in order to preserve their exclusive use of it. It's a tactic seen many times from residents of exclusive Malibu beach estates and millionaires who would keep the public off of a "private beach" in order to preserve their "private access."

Amazingly this public access project is threatened not by private property owners, but by an even more exclusive group: paraglider hobbyists, who demand that you re-route a proposed hiking trail away from coastal views and ocean breezes in favor of freeway fumes and traffic noise! And they want you to do that even though no one has asked them to stop flying there, despite the fact that their actions are likely in violation of the FAA's own regulations regarding low level flying over a freeway, a railroad, and a county park! How is this better for the thousands of Californians who simply want to walk their own coastline?

We urge you to disregard this small, exclusive, vocal minority and stand up for all Californians' time-tested right to access their own coastline.

Please support the coastal route of the Rincon Trail and approve the revised EIR.

Todd and Lauren Jared

Thank you very much for meeting with all of us regarding the proposed Multi Use Trail. My name is George Jimenez.

I'd like to express my opposition to the proposed Multi Use Rincon trail project. As a paraglider and flyer for over twenty years, I truly believe there's a better way to construct this project and avoid the loss of our flying site.

As a Carpinteria resident, and member of this community for over 60 years, I see this project as expensive construction that spends too much of the community's money, destroys the environment and make a path in the wrong place.

The current design doesn't follow the existing highway 101 or the old railroad alignment. The logical place for this path is to put it on the north side of the freeway to connect to the existing bike path from Rincon to Muscle Shoals and Sea Cliff.

It's my understanding, Cal Trans was originally required to extend the existing bike path along the 101-freeway corridor.

Then the City of Carpinteria got involved and changed the entire project. As proposed this trail is too large, incompatible with the open space requirements, intrusive to the natural environment and ESHA of the area.

It also destroys our flying site forever.

Best practices would utilize the already established area for the new parking lot and bathrooms at the end of Carpinteria Avenue for this trail then hook up with Caltrans to run the path along the north side of the 101 freeway.

As paragliders we also oppose the massive scale of this project, the 312,000 tons of soil and 4,500 truckloads to be removed from the site which will travel through Carpinteria.

This project proposes to level the hillside and create a monster path with significant environmental impacts including erosion and violation of CEQA standards. It also creates a dangerous situation at Rincon parking lot when it

dumps all trail users into the overcrowded parking lot. This creates a serious liability and could cause pain and suffering to cyclists, and other trail users.

As a long time, paraglider, I ask you to carefully consider these impacts along with the loss of a valuable historical soaring site. Please let's not destroy one recreational activity to make way for a trail in the wrong place. As a member of the Paragliding Association I believe there's a better way to construct this path for all recreational uses.

Thank you for your time.

Respectfully Submitted,

George Jimenez

Carpinteria City,

Free flyers are the most frequent users of the bluff in question for the last 40+ years. The current proposed bike path will end that popular recreational use of the bluff. Our group is well organized and we have secured nationwide support with a deep well of resources. With over 2800 people signing the petition, we will not quit fighting for this natural resource. Since our fight began, it has gone from a $6 million project to an $18 million dollar project. Is this all for 200 feet of ocean view? The bridge is a silly waste of money that the ocean will reclaim soon. Why not have a long ocean view by starting the bike path near ProCore, run along the Bluffs 3 project which already has a natural slope down to the railroad tracks, have a pedestrian crossing on the tracks and continue the trail on the old railroad cut? Cost would probably be less than $500,000 and you would have a long path along the ocean front with no bridge needed and without destroying the bluff. Thousands of people a day cross the Linden Tracks and Campground tracks without issue.

The point is, we need a different plan that is good for both bikes and free flying. Paragliding is a very expensive hobby and many wealthy out of towners come to Carpinteria to fly and spend lots of money in Carpinteria. Do not kill this natural resource and economic booster.

Thanks

Aaron LaPlante

Thousands of us are desperate to see the ridge preserved, it means everything to us, and yet hundreds of our public comments have been ignored, and the authors of the EIR have taken everything they thought they knew about pilots and flying, and tried to discredit our access and right to recreation. This incredibly oppositional approach is hard for us to understand. As citizens and users of Bates and Rincon for over four decades, we are dedicated to being heard and have given feedback at every opportunity, and still no alternatives are being supported that protect the ridge over the last 12 years of this project planning. Please change your course and collaborate with your fellow citizens.

Thank you,
Jeff

Re: Rincon Trail Environmental Impact Report

Dear Mr. Bobroff:

I want to say thank you for all your efforts into improving cycling paths. The La Conchita parkway is stellar. And I look forward to the planned improvements for in-city Carpinteria. I commend your vision of the Rincon Trail, which includes an ocean view.

Unfortunately these three issues have me gravely concerned.

-Bike Safety.

-Losing the sport of Paragliders, which is a city revenue generator. (the only other one is in San Diego) -Environmental Impact of all the dirt removal.

Fortunately there is another option.

The bike path extending along the southbound 101 freeway. As shown in option B.
https://friendsofbatesbeach.org/information/rincon-trail.

And wouldn't Option B be Cheaper?

Thank you for your time,
With all my Biking Heart,

Helen O'Neill

RE: **Carpinteria Rincon Trail Project**

To Whom it may concern:

On a recent trip to the Ventura and Carpinteria area, specifically to the Bates Paragliding site I was told of the proposal to put in a new bike path. After hearing of the proposal and looking at the proposed alignment a letter seemed in order. I am a Professional Civil Engineer, avid bicycle rider, both road and mountain and a paraglider pilot.

I currently live in Nevada City, California and for the past eight years have made several trips each year to the area. If conditions are right each trip involves surfing, flying and bike riding. The Bates flying site represents a very special and unique feature that is found in only a handful of places along the coast of California especially in regards to the accessibility of the site. Not only are the views awe inspiring and incredible, the drive-up nature of the site makes it extremely appealing. As a bicycle rider I also appreciate the bike paths that have been made in an attempt to keep cyclists safe from traffic.

Looking at this proposed path alignment, the main goal of it seems to be maximizing ocean views, which it does well. Other significant factors appear to have been neglected and or overlooked. I'll list three here. First, this path creates a potential conflicting and hazardous interaction between two recreational activities, paragliding and bike riding. In low wind conditions paraglider pilots often find lift by flying close to hill or mountainsides. Picture a bicyclist descending the path with a paraglider pilot 6' off the ground in an oncoming direction. Second, this path puts bicyclists directly at the end of an already congested and narrow parking lot. As a road bike rider, myself and most others I know go will go to lengths to avoid riding through busy parking lots. The variability of drivers and non-predictability is high. Riding in a bike lane alongside traffic represents for the most part a more predictable outcome. Drivers are in a lane heading in a particular direction. A parking lot is far more prone to vehicle randomness and thus undesirable and dangerous, to the rider, interaction. Third, tax payer expense both short term and over the course of time. Pursuing this alignment is no small feat in regards to labor, earthwork quantities and the potential building of a bridge. I believe exact earthwork quantities have been presented in other letters. Longevity of the project is questionable as it would be built atop a slope with marginal stability. One need only walk down to the Bates beach and look at the hillside to see what time and environmental factors do the soil at hand.

William C. Prechter
Civil Engineer
PO Box 454 Nevada City, CA 95959
(530) 265-0733

In my own consulting practice I strive to keep architectural design and aesthetics as a main priority. As such I can appreciate what this path is attempting to do. There are at times moments where overall functionality, practicality and macro perspective can be forgotten in one's attempt to hold too firm a grasp to a single idea. This appears to be the case here. I strongly encourage the thorough investigation of other options prior to the approval of this particular path. As it would appear all factors have not been considered.

Sincerely,
William Prechter PE

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

To whom it may concern,

I'm respectfully writing to you to present my concerns about the Rincon Trail Bike Path. I've broken my points down into bullets below. The project planners have consistently avoided listening to community groups and have forced an untenable design that has now run out of time and money. The path forward should not involve pouring more money into this design, **we need to build a better bike path on the North side of the bluffs in accordance with Alternative 4 of the EIR.** If this means reapplying for the ATP grant, then the project planners need to accept responsibility and begin positioning the project to be worthy of this allocation going forward.

I am eager for the construction of a bike path, but one that is built on the North side of the bluffs because it is safer and more direct for cyclists. The current design dumps bikers into a crowded and steep parking lot. I bike this corridor frequently and have no desire to detour through a parking lot, especially when the city has no plans for managing traffic in this area and some of my friends have already been hurt by cars backing out on the hill at Rincon Park.

I want a bike path that is better for the environment. The current design excavates and hauls away 312 million pounds of soil, which is upward of 5,000 truckloads, **forever altering the coastline**. I doubt the California Coastal Commission will rubber stamp an earthmoving project of this magnitude and it's unlikely to be completed in the allotted 24 month timeline given the environmental controls, high traffic, difficult access, and permitting required. A new design is needed to get finished in time.

I want a bike path that is less expensive. The current project is estimated to cost $12 million for 0.2 miles of path, that’s $12,000 per foot! It will drain capital resources for the future. When we look for money to support other transportation needs or to help handicapped users or to find ways to mitigate the 101 impacts, do we want to look back and realized we overspent on 1,000 ft of path, forcing it to be built in a precarious and difficult location because the planners are focused on a 'blue ocean view'? A more useful path for cyclists can be created without spending this ridiculous amount of money.

I want a bike path that has a chance of being built. This design is already 200% over budget and 20 months behind schedule with 65% of the remaining tasks rated at HIGH RISK of not finishing. The engineering and

necessary approvals are proving nearly impossible with the current design. Pouring more money into this project isn't the way to get it done. A better design is needed.

I signed a **petition with 2,800 signatures** because I want to see the south side of the ridge preserved for the historic flying that happens there, which has existed for over 40 years. **Flying at Bates is protected recreation under the California Environmental Quality Act and has not been properly addressed in the EIR.** Law requires mitigations for existing recreation and the planners continue to insist there are not significant impacts from the project when expert testimony has argued otherwise. Even the data presented in the 'wind study' is theoretical in nature and the authors will gladly discuss how it is being incorrectly applied. There will be more delays to the project because of this oversight and it will remain open to legal challenges. **Removing soil from this area will not just lessen the quality of flying at Bates, it will end it forever. The site will become completely unflyable.**

The project planners have not been listening to community groups and have tried to skip steps. The flying community for example, has 1,000 local members who feel they aren't being heard. A coalition is building between bikers, pilots, and other groups in support of EIR Alternative 4, which will build on the North side of the bluffs. This design will be easier to build, cost less, be safer for bikers, and better for pilots.

I urge you to please listen to your community members who want a different design, a bike path to use at the end of it all, and paragliders to watch as they bike past.

Thank you,

Olivia Puckrin

Good evening, Chair Benefield, members of the Planning Commission, City Staff, and all Carpinterians tuned into tonight to this meeting. My name is Ted Rhodes, speaking tonight as President of Citizens for the Carpinteria Bluffs.

- We support the request of the City of Carpinteria for the Planning Commission here tonight to consider and approve a Conditional Use Permit & Coastal Development Permit to allow the construction of the 850-linear foot segment of the proposed Rincon Trail project located in the City of Carpinteria.

- Regarding the entire project, we also support the Planning Commission in certifying hopefully tonight, the Environmental Impact Report (EIR) prepared for the entirety of the project pursuant to the California Environmental Quality Act (CEQA) Guidelines.

- As you well know, Citizens for the Carpinteria Bluffs, in partnership with the Land Trust for Santa Barbara County, has played a key role in the public acquisition efforts of the Carpinteria Bluffs Nature Preserve, theViola Fields, and the Rincon Bluffs Preserve. We are excited about the the City of Carpinteria's Rincon Multi-Use Trail project and look forward to it becoming a reality in the near future. As we stated at the earlier scoping hearing, this trail will provide a much needed link from the Carpinteria Nature Preserve and the Rincon Bluffs to the coastal walking & biking path that now runs from Rincon south to Ventura.
- And, on a more personal note, as an enthusiastic bicyclist myself who suffered a serious injury a few years ago when I was hit by a car while bicycling on one of our local streets, I can't wait until this project comes to fruition enabling me to ride safely from the Carpinteria Bluffs to Rincon and onwards to other points south along the Ventura coast.

Thank you.

Ted Rhodes

Re: Rincon Trail Project 19-2015-CUP/CDP

Dear Mr. Bobroff:

Thank you for contacting the Tribal Elders' Council for the Santa Ynez Band of Chumash Indians.

At this time, the Elders' Council requests no further consultation on this project; however, we understand that as part of NHPA Section 106, we must be notified of the project.

Thank you for remembering that at one time our ancestors walked this sacred land.

Sincerely Yours,

Kelsi A. Shroll

Dear Mr. Bobroff,
The Central Coast Water Board previously submitted comments on the mitigated negative declaration for this project in 2020. Those comments do not appear to be included in the record and have not been addressed in this document.

#1 – Resolution No. R3-2013-0032 - Central Coast Post-Construction requirements (PCRs) does not appear to be included in the design for this project to protect water quality for the increased impervious surfaces generated by this project. The portion of the project within the City limits must comply with those requirements. The project is not an exempt project because water is collected in lined channels and discharged to the beach.

#2 – The area of project that falls outside of the City limits must comply with the Statewide Construction General Permit (CGP) post-construction requirements. The project documents discuss how the site will meet the active BMP controls for limiting erosion and sedimentation, but it does not show the project meets the post-construction requirements of the CGP, namely the pre-post match of the 85th percentile 24-hr storm. Runoff is directly discharged to the beach.

#3 – The parking lot proposed in Carpinteria included on the Proposed-Rincon-Trail-Alignment.pdf (carpinteriaca.gov) is not discussed in this project. That project must also meet all post-construction requirements. If the work planned for the existing trailhead/road in Carpinteria includes more than chip-seal (e.g. curb and gutter, extension of pavement edge), that portion will also be subject to the PCRs.

There are many options available for infiltrating and treating stormwater runoff to reduce pathogens, pesticides, sediment, and trash likely to be included in runoff from this project. Please work to include these elements.

Sincerely,
Lucas

Subject: January 18, 2022- City of Carpinteria Planning Commission Hearing Notice- Rincon Trail Project

EXTERNAL:

Good evening,

I have attached the hearing notice for the "Rincon Trail project" item, which will be considered by the Carpinteria Planning Commission on January 18, 2022.

Comment letters may be submitted to the City via (1) email to: PublicComment@ci.carpinteria.ca.us or (2) the **eComment** link on the City's agenda website (https://carpinteria.ca.us/city-hall/agendas-meetings), once the agenda has been posted. Please reference the agenda item to which your comment pertains. Note that written comments will not be read into the record during the meeting. **Comment letters must be submitted prior to 12:00 p.m. on the day of the hearing in order to be distributed to the Planning Commission.**

The **agenda and staff report** will be posted to the City website on or prior to, **Thursday, January 13, 2022**, here, under the "Upcoming Events" heading:
https://carpinteriaca.gov/city-hall/agendas-meetings/

The **Proposed Final EIR** prepared for the Rincon Trail project is currently available on the City website here:
https://carpinteriaca.gov/public-works/engineering-division/rincon-multi-use-trail/

If you have questions about the proposed project, please feel free to contact me by phone or email.

Nick Bobroff, Principal Planner
Community Development Department

Subject: Rincon Trail project concerns

In response to Rincon Trail project at Bates Ridge:

1. Bates ridge is a unique and rare flying site for the area of Caprinteria. It is critical that places like this be preserved as they are in danger throughout the country.
2. Bike paths are great, but let's build on the North side of the bluffs because it is safer and more direct for cyclists. The current design dumps bikers into a crowded and steep parking lot.
3. One importance of biking is to support the environment, and I want this development to be better for the environment as well. The current design excavates and hauls away 312 million lbs of soil, which is upward of 5,000 truckloads. Forever altering the coastline.
4. I want a bike path that is less expensive. The current project is estimated to cost $16 million for 0.2 miles of path, that’s $16,000 per foot! It will drain capital resources for the future.
5. Flying at Bates is protected recreation under the California Environmental Quality Act and has not been properly addressed in the EIR, there will likely be more project delays because of this.

6. The project planners haven't been listening to community groups and have tried to skip steps. The flying community for example has 1,000 local members who want to see a better design.
7. The Environmental Impact Report presents Alternative 4, which will build on the North side of the bluffs. This design will be easier to design, cost less, be safer for bikers, and better for pilots.
8. The planners have used up their time and money, causing the project to risk losing its grant. We should not be forced to rush now because of their unfeasible design and slow progress. If the project needs to reapply for an ATP grant, it is the fault of the planners, not community groups.

Thank you for your thoughtful consideration.
Jason Wallace
Concerned paraglider pilot

Agenda Item --	Name --	Comment --	Position --	Submitted At --
2) Project: Rincon Trail, Project # 19-2015-CUP/CDP Location: Connection of the east end of Carpinteria Avenue to Rincon Beach County Park Applicant: Matt Roberts, Parks, Recreation and Public Facilities Director Planner: Nick Bobroff Hearing on the request of Matt Roberts, Parks, Recreation and Public Facilities Director for the City of Carpinteria to consider Project 19-2015-CUP/CDP (application filed October 17, 2019) for a Conditional Use Permit and a Coastal Development Permit to allow the construction of the 850-linear foot segment of the proposed Rincon Trail project located in the City of Carpinteria (the remaining 1,900 feet of the proposed trail is located within the jurisdiction of the County of Santa Barbara); and to certify the Environmental Impact Report (EIR) prepared for the entirety of the project pursuant to the California Environmental Quality Act (CEQA) Guidelines. The EIR and all documents referenced therein may be reviewed at the Community Development Department, 5775 Carpinteria Avenue, Carpinteria. The EIR is also available for review on the City	Tony Wilkinson	I strongly OPPOSE the selection of Alternative #3 (the bluff-top route) for the Rincon Trail Project over Alternative #4 (the highway-side route). The analysis in the Environmental Impact Report, prepared by the city's public works staff with outside consultants, rates #4 impacts as "greater" simply because that built trail route is longer. This ignores #3's negative impacts on (1) public safety, dumping bicycle traffic from the trail into the narrow and congested Rincon Beach County Park parking lot, (2) ADA accessibility because of the steep decline toward Bates Road at the East end from the county lot, (3) the acknowledged reduction in cliff updraft needed for paraglider recreation because the #3 route will require bulldozing the top off the cliffs, and (4) the UNMENTIONED negative effects on sand erosion and pollution from #3 dumping its stormwater onto the beach below (#4 uses freeway drainage). One suspects #3 is the preferred route mainly because public works wants to use the county parking lot to save on construction costs. | The public deserves the safest and the best project possible, not the cheapest project obtained by using the unsuitable county parking lot as a trail extension. Please place the recreation community first and choose the BEST trail route, highway-side Alternative #4. | Tony Wilkinson, Los Angeles, California | tonyw.civic@gmail.com | 'Bates Beach' / Rincon Park frequent user | Former Santa Barbara County resident (Montecito's last paper boy)	Oppose	01-18-2022 06:35 am

Carpinteria trail Appeal

Snapshot of the item below:

Karl Cameron
January 28, 2022
City of Carpinteria, City Council
5775 Carpinteria Avenue
Carpinteria, CA 93013

Appeal of Planning Commission Decision, Rincon Trail Project

To the Carpinteria City Council Members,

1. The selected Alternative #3 is focused on providing a “blue ocean view” rather than a safe, useful, esthetically pleasing, less costly less environmentally intrusive, more sustainable alternative. There is no plan for maintaining this bike path after it's constructed on a 100-year-old eroding seawall, where a railroad and highway easement have failed and been abandoned. There is also no plan for managing traffic in the already congested and incredibly steep Rincon Beach parking lot where the bike path terminates. This design needs to be reassessed from the perspective of the very groups it's trying to help.
1. The conceptual plans presented to decision-making authorities and to the public have differed between the Planning Commission meeting on January 18, 2022, and the SBCAG meeting on January 20, 2022. While the Planning Commission reviewed EIR Alternative #3 with a straight cut into the ridge, the SBCAG presentation focused on a path with an ‘elbow’ bend toward the ocean. The significant differences between these conceptual plans are misleading and confusing. This lack of clarity is exacerbated by the omission of engineer estimates and analysis for the EIR Alternatives, and the lack of line items describing details of the trail construction and materials. An appeal is needed to determine what aspects of the conceptual design are being proposed to the public illuminate the key details such as trail alignment and provide what real alternatives can provide.
2. Since the EIR gives no real engineering info or Documentation on Alternative (#4) which places the Bike path on the north side of the Bluffs. There is no way to provide a real comparison of the different alternatives
1. The EIR report now is showing another extension to the bike bath leading thru the parking lot of the county park leading all the way to Bates Rd.
1. This 14ft wide path with 2 ft side lanes requires more concrete walls and a lot more dirt work all the way to Bates road, Making the pike path some 1000s of feet longer thru the Park.
2. There is an abandoned well in the middle of the trail that has not been properly abandoned and caped as documented in the EIR.
1. The California Department of Conservation has written (A} that there is no oil/gas zone plug (B) There is no freshwater plug. © There is no casing shoe plug. (D) there is no surface Plug. This is shown in the

EIR The construction of alternative 3 will cover the well and involve a lot of liability and cost.

2. Coast Act 30240 requires Envirmrntal sensitive Habitat areas to be protected to the maximum extent possible. The EIR has documented 3 protected plants specifically that will be significantly impacted that are in the footprint of the trail on option (3). As stated in the EIR there is no way to mitigate the impacts of these plants as they have a low survivability after being moved.
3. Option (3) also requires removing a Large Monterey Pine tree in the middle of the trail before the parking lot along with other trees.

All of these impacts from selecting 3 as the least impactful are not true as stated in the EIR. The city is wanting to build on option 3 so have tried to make it look like it's better.
A statement that option 2 could not be used as it's in an earthquake zone is true as the whole area is in this zone. Not just option 3. The earthquake zone runs from south of the Venture County line up into Carpinteria as stated in the documents.
Option 4 does not have plant impacts, or as much earth work when including the extra work needed to build option 3 bike path thru the county Park.
Option 4 does not need as much large slope work done as it follows the grade of the bates offramp. Similar to the Summerland Bike Path next to the Highway.
The EIR is not complete as it does not fully document all of the impacts of all of the options that a truly informed decision can be made.
I am requesting an Appeal of this EIR and Conditional Use Permit and a Coastal Development Permit for the proposed Multi Use Trail (M.U.T.), Rincon Trail Project 19-2015-CUP/CDP.
I await your response

Re: *Project # 19-2015-CUP/CUP, State Clearing House No. 2020100582 - Appeal of Certification of Carpinteria Rincon Trail Project EIR and Project Approval*

Gentleman and esteemed City Councilmembers:

On behalf of the Santa Barbara Soaring Association ("Association"), we hereby tender the Association's appeal of the City of Carpinteria Planning Commission's ("Planning Commission") certification of the Final Environmental Impact Report ("EIR") and approval of the Rincon Trail Project ("Project") under Agenda Item 2 at its January 18, 2022 meeting, pursuant to Carpinteria Municipal Code section 14.78.040.

The grounds for appeal are as follows:

(1) The Planning Commission wrongly determined that the Project's impact on the wind intensity and patterns at the Project site and its surroundings is not an impact on the environment;

(2) No threshold of significance was established for the Project's impact on wind that the Freeflight community relies upon to participate in the recreation of freeflight;

(3) The EIR failed to identify the substantial alteration of the Project site to be as significant view impact;

(4) The Planning Commission improperly considered the lack of the Association's property rights at the Project to justify destroying the freeflight recreation at the Project site; and

(5) The Planning Commission failed to recognize that Alternative 4 is the least environmental damaging alternative, other than the No Project Alternative.

THE PROJECT.

The Project would reduce a scenic vista coastal bluff to molehill by removing a whopping 107,386 cubic yards of the bluff. (Draft EIR, § 2.7.1, p. 2-10.) The Project would create a "16-foot trail" made of concrete to accommodate emergency and maintenance vehicles. (*Id*. p. 2-15.) Merriam-Webster defines "trail" to be "(1): a track made by passage especially through a wilderness [¶] (2): a marked or established path or route especially through a forest or mountainous region." (https://www.merriam-webster.com/dictionary/trail.) Make no mistake about it, this concrete monstrosity is not a trail, but a road. (https://www.merriam-webster.com/dictionary/road "2 a: an open way for vehicles, persons, and animals.")

THE ASSOCIATION.

The Association is a group of persons engaged in the recreation of "freeflight," which is flight that does not utilize a motor, but instead capitalizes on the wind in order to stay aloft. The Association has been flying paragliders and hang-gliders at the Project site's ocean bluff for 40 years. The Project site provides one of the only few ocean ridge lift sites available in California for freeflight recreation. With the constant prevailing wind off the ocean and steepness of the ocean bluff, Association members are able to fly or "soar" for hours at a time, providing a recreational respite for the Association's members. The Association welcomes all who wish to engage in freeflight.

We have been vocal concerning this Project over the years. Our member, Otis Gillespie, filed the first appeal to City Council when he demonstrated that a mitigated negative declaration was not an adequate environmental review document. We have raised our concerns at the public meetings, city meetings, and have commented on the Final EIR. (Ottis Gillespie submitted Letter Nos. I-8, I-11, I-21, and I-32; Jeffrey Longcor submitted Letter No. I-27; and Rob Sporrer submitted Letter No. I-31; Final EIR p. 2-2.) Unfortunately, none of their letters were included in the Final EIR. Instead of directly addressing our Association members' comments, the Final EIR simply includes Global Response GR1: Impacts Upon Soaring Opportunities/Airflow Study. (Final EIR, pp. 2-4 through 2.6.) Unfortunately, this response fails to recognize the Project's impact on winds affecting freeflight as an environmental impact.

1. THE PROJECT'S IMPACT ON WIND AT THE PROJECT SITE IS AN IMPACT ON THE ENVIRONMENT.

A. Wind Is Part of the Environment.

On page 3.11-8, the Draft EIR states, "Although the air space above the proposed trail is not a public recreational facility for the purposes of the CEQA Guidelines…." Not only is this untrue, but it the unique character of the ocean bluff, with the Project Site that creates the public recreational facility of freeflight. It is common sense that wind is part of the environment, even if you cannot see it. "Environment" is defined by the CEQA Guidelines as, "[T]he physical conditions which exist within the area which will be affected by a proposed project including land, ***air***…. The 'environment' includes both natural and man-made conditions." (CEQA Guidelines, § 15360, emph. added.) We cannot see air quality impacts, but they definitely exist and are extensively studied under CEQA. It is beyond understandable how the Planning Commission can make such an outlandish determination that wind is not part of the environment, and paragliding and hang-gliding are not recreational activities reliant on a facility.

On page 3.11-9, the Draft EIR contends that decreasing the recreational activity of freeflight is nothing more than a social or economic change. This is an absurd conclusion. Recreational activities are clearly part of the protected environment under CEQA. One need only look no

further than the Initial Study Checklist at Appendix G of the CEQA Guidelines that identifies "Recreation" as an environmental factor potentially affected by a project.

A commenter challenged the statement that there would be no significant impact on soaring activities and the Project's wind impact would destroy the recreational freeflight at the Project site. (Final EIR, Comment Letter I11-4, pdf p. 113.) Another commenter made the same challenge. (*Id*. Comment Letter comments I27-4 and I27-5, pdf p. 157.) Yet another comment made similar challenges. (*Id*. Comment Letter I31.) In response, the Final EIR points the reader back to Global Response GR1.

Unfortunately, Global Response GR1 improperly continues to contend that the Project's impacts on the wind supporting the recreational activity of freeflight is not an environmental impact. (Final EIR, p. 2-6.) The Planning Commission cannot make an informed decision on the Project until it understands that the Project's impact on wind supporting freeflight is an environmental impact.

B. Dudek Is No Expert on Wind.

Nowhere in the record has Dudek demonstrated that it has sufficient expertise to analyze or opine on the Project's impact on the wind relied on by the freeflight community. Moreover, the "Airflow analysis of the proposed [sic] regarding of the Rincon Bluffs" in Appendix I (the "Rincon Airflow Analysis") does not demonstrate that Paolo Luzzatto-Fegiz is an expert in wind dynamics or soaring flight. His inexperience is demonstrated by the incomplete study, which fails to use generally accepted scientific and soaring principles to calculate and analyze the impacts of wind reduction on freeflight. In a January 16, 2022 letter submitted to the Planning Commission, renowned micrometeorology and freeflight expert Dennis Pagen, whose work is cited in the Rincon Airflow Analysis itself, explains that the Rincon Airflow analysis report is inaccurate because it ignores important factors like the depth and length of the ridge, the wind gradient, the creation of turbulent rotor zones and venturis, and changes in thermal patterns. He concludes that the data used in the Rincon Airflow Analysis fails to accurately represent the bigger picture and real-world conditions, and that it is predominantly based on sailplanes, which are rigid gliders with wingspans up to 100 feet that operate entirely differently from paragliders and hang gliders.

One of the more glaring oversights with respect to the soaring analysis in the EIR is the use of off-handed citations of operating wind speeds from the Torrey Pines Gliderport and USHPA website freeflight newcomer FAQ pages, to mistakenly arrive at a 50% wind speed operating margin, and thus conclude that the 30% reduction in vertical velocity calculated in the Rincon Airflow Study does not constitute a "significant impact" to soaring activities under CEQA.

Any soaring pilot will quickly recognize that the wind speeds cited on these basic, informational FAQ pages are not intended as a universal or scientific statement of the effect of wind speed on freeflight. A meaningful analysis of the significance of a given wind speed reduction on soaring

activities would consider information about aircraft type, flight regime, weather, actual wind speed and direction, and other factors. For example, a 30% reduction in wind speed from 15 mph to 10.5 mph from a perpendicular direction on a sunny day may not result in a significant impact for a launching paraglider. On the other hand, a reduction in wind speed from 10 mph to 7 mph from a cross-slope direction on a cloudy day will certainly impact a hang glider trying to sustain soaring flight. These facts and other soaring-related science was presented to the panel by Association pilots in public meetings, emails, and other fora, but the EIR failed to factor this record testimony into its analysis of the threshold of significance for soaring activities at Bates. Friends of Bates Beach raised concerns with the Draft EIR's analysis feeling that the 30% reduction in wind was improperly downplayed. (Final EIR, Comment O1-10, p. 62.) The response to this comment was simply to direct the reader to Global Response GR1, which continues to ignore the significant impact that a 30% reduction in wind would have on freeflight.

CEQA requires government agencies to use reasonable efforts, to consider the specific environmental context of a project, and to establish thresholds of significance. (*Protect the Historic Amador Waterway v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1105-12.) What might be insignificant to re-grading a random hillside becomes significant when a project jeopardizes 40 years of soaring history and the only coastal ridge soaring site for nearly 100 miles. The Commission failed to satisfy its burden to make a reasonable effort to translate a purported 30% reduction estimate into a corresponding impact on soaring activities, and to then assess whether that impact is "significant" under CEQA. In so doing, the Planning Commission has run afoul of CEQA.

2. <u>THE PLANNING COMMISSION FAILED TO SET A THRESHOLD OF SIGNIFICANCE FOR THE PROJECT'S IMPACT ON WIND.</u>

As discussed above, with the EIR's shocking claim that the Project's impact on wind supporting freeflight is not an environmental impact, the Planning Commission neglected to establish a threshold of significance to be able to discern whether the Project's impact on wind, and therefore, the recreation of freeflight. The EIR is incomplete and inadequate without a threshold of significance on the wind impact and analysis of whether that wind impact is significant.

3. <u>THE PLANNING COMMISSION WRONGLY DETERMINED THAT THE PROJECT'S SUBSTANTIAL ALTERATION OF THE PROJECT SITE WOULD NOT CREATE A SIGNIFICANT VIEW IMPACT.</u>

The Draft EIR admits that the ocean bluffs are scenic vistas and resources. (*Id.* § 3.1.1.3, p. 3.1-2.) Two of the significance thresholds are "a) Have a substantial adverse affect on a scenic vista" and "b) Substantially damage scenic resources…." (*Id.* §3.1.3, p. 3.1-6.) The Draft EIR finds that the Project's impact to a scenic vista would be potentially significant, but with mitigation Measure AES-1, the impacts would be less than significant. (*Id.* § 3.1.4(a), p. 3.1-

6.) Mitigation Measure AES-1 only requires a review and approval by the City's Architectural Review Board and County Board of Architectural Review. This is not mitigation by any shape or means and cannot mitigate the significant alteration of the ocean bluff to the tune of over 100,000 cubic yards of removal of a scenic vista. The Planning Commission cannot rely on this fake mitigation measure, and it should have found the Project's impact to the ocean bluff scenic vista as significant and unavoidable. The determine that the significant scenic vista impact would be less than significant by bare approvals of two review boards is simply in error and must be reversed.

The Association's Ottis Gillespie commented that the removal of 92,526 cubic yards from the ocean bluff would eliminate a regional coastal resource. (Final EIR, Comment Letter comment I32-3, pdf p. 180.) In response, the Final EIR points the reader to response I32-8, which mere responds that the comment does not raise any issue concerning the adequacy of the Draft EIR. No further response is required or provided. This is an improper response calling into question the conclusion that the elimination of a regional coastal resource would be less than significant.

The County of Santa Barbara Planning and Development Department commented that the EIR needs to discuss how the Project is consistent with the Coastal Act Policies. (Final EIR, Comment Letter L3-4, pdf pp. 75-77.) Two of those Policies- 30251 and CLUP Policy 4-3 concern protecting views along the ocean and that projects shall be designed to follow the natural contours of the landscape. The response is simply, "These policies have been added to Section 3.9.2 of the EIR (See Chapter 3, Errata). Looking at the Errata, there is no specific analysis explaining how the Project is compliant with the view policies. As a result, the EIR analysis is incomplete, and the Planning Commission should not have certified the EIR or approved the Project.

4. THE PLANNING COMMISSION IMPROPERLY CONSIDERED THE LACK OF THE ASSOCIATION'S PROPERTY RIGHT AT THE PROJECT TO JUSTIFY DESTROYING FREEFLIGHT RECREATION AT THE PROJECT SITE.

On page 3.11-3, the Draft EIR reports that glider take-off or landings are prohibited in Rincon County Beach Park and that the paragliders and hang-gliders have no "sanctioned use [of] public property." The Draft EIR cites no legal authority for this bare and demonstrably false assertion. In fact, freeflight pilots fly legally in the Bates Bluff airspace as recognized by the Federal Aviation Administration (FAA) and United States Hang Gliding & Paragliding Association (USHPA). Pilots have federal permission and legal authority to use this airspace.

Moreover, claims that the Association has no property rights, and thus, are essentially trespassing have no place in a CEQA analysis. Numerous cases have held that it does not matter if an existing activity is legal or illegal, the mere fact that it occurs makes is a part of the environment.

(*Riverwatch v. County of San Diego* (1999) 76 Cal.App.4th 1428, 1452–1453, (baseline for a proposed quarry development was the actual condition of the land, even though some existing environmental degradation had resulted from prior illegal mining and clearing activities); *Fat v. County of Sacramento* (2002) 97 Cal.App.4th 1270, 1278–80 (baseline for airport expansion was existing airport operations, even though the airport had been operating and had expanded without a required permit for several years); *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal.App.4th 357, 370–71(baseline for proposed school playground use was the existing playground facility, even though prior construction of the facility may have violated the city's code).) Thus, an environmental review must analyze a project's impact on illegal or even "unsanctioned" existing activities, and if found to be significant, must be mitigated, if feasible.

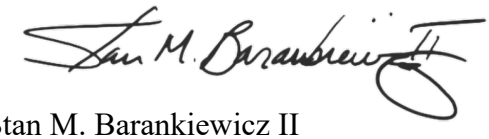
During the ERC Meeting, a commenter asserted that the soaring activities are "fully legal and sanctioned". (Final EIR, pdf p. 215.)

Tainting the proceedings before the Planning Commission with irrelevant characterizations of an existing use as "unsanctioned" is a false and highly prejudicial attempt to degrade the history and importance of freeflight at the Project site. This should never have been included in the Draft EIR, as it is only intended to inflame the passions of the Planning Commission and distract them from an objective environmental analysis. Unfortunately, staff do not comprehend, and the Planning Commission has not been duly advised of, the correct state of law concerning the legality of existing freeflight uses, nor of the relevance of such legality to CEQA analysis.

5. THE PLANNING COMMISSION FAILED TO RECOGNIZE THAT ALTERNATIVE 4 IS THE LEAST ENVIRONMENTAL DAMAGING ALTERNATIVE, OTHER THAN THE NO PROJECT ALTERNATIVE.

Recreational activities have no hierarchy in CEQA. All are equally important and must not be significantly impacted if possible. The argument that there would be more trail users than freeflight users is not sanctioned under CEQA. All recreation activities are protected under CEQA.

Alternative 4 would not destroy the existing freeflight recreation that has existed for 40 years at the ocean bluffs and the trail could be completed, thereby accommodating all recreational uses of the ocean bluffs. Every other Project alternative, except for the No Project Alternative, would destroy the freeflight recreational use of ocean bluffs. Thus, every alternative, except Alternative 4, would create a significant impact by eliminating or severely reducing the freeflight recreational use of the Project site. Accordingly, only Alternative 4 is the least environmentally damaging alternative. Moreover, Alternative 4 meets all of the Project objectives. The Planning Commission should have approved Alternative 4 to comply with CEQA.



Comment letter I6 raised the concern with the destruction of freeflight and Alternative 4 would preserve it. (Final EIR, pdf p. 96.) The response was that the comment did not raise any concern

with the adequacy of the Draft EIR. (*Id*. pdf p. 96.) Comment Letter I9 made a similar comment with a similar response in the Final EIR. (*Id*. pdf pp. 108-9.) Comment I15-3 made a similar comment with a similar response in the Final EIR (*Id*. pdf. pp. 128-29.) The same is true for Comment I20-2. (*Id*. pdf pp. 138-39.) Comment I24-2 expressly noted that Alternative Four would have the least environmental impact. (*Id*. pdf p. 147.) The response was this comment did not raise any issue concerning the adequacy of the Draft EIR. (*Id*. pdf p. 149.) These responses fail to recognize that Alternative 4 is actually the least environmentally damaging alternative.

6. CONCLUSION.

Due to the limited time in which to prepare this appeal, additional arguments of the Association are presented in Attachment 1. For the foregoing reasons, the Planning Commission violated CEQA in certifying the Project's Final EIR and approving the Project. Accordingly, the Association respectfully requests the City Council to approve this appeal and vacate the Planning Commission's certification of the Project's Final EIR and approval of the Project. Failure to do so will result in an appeal to the Coastal Commission.

Very truly yours,
ORBACH HUFF & HENDERSON LLP

Carpinteria, CA 93013

RE: Formal Appeal of Planning Commission Decision, Rincon Trail Project

To the Carpinteria City Council Members,

The Santa Barbara Soaring Association (SBSA) and other interested parties, are appealing the City of Carpinteria's Planning Commission's decision on January 18, 2022 to certify the Focused Environmental Impact Report (EIR) of December 2021 by Dudek, and the granting of a Conditional Use Permit and a Coastal Development Permit for the proposed Multi Use Trail (M.U.T.), Rincon Trail Project 19-2015-CUP/CDP. Listed below are the reasons for the appeal to you, the Carpinteria City Council. Please advise on hearing dates to discuss further.

1. California Environmental Quality Act (CEQA) of 1970, requires an evaluation of how the project will impact existing recreation. The law regards all forms of established recreation to be worthy of impact analysis and subsequent mitigation. There is no qualification within CEQA concerning the type of recreation, method of access, or future condition. The EIR fails to comply with CEQA by discrediting and dismissing a group of recreational users who have been operating at this site for 40 years. Rather than conducting reasonable review of project impacts and measures for mitigation, the EIR is designed to overlook and exclude. This issue was highlighted by the Environmental Review Committee (ERC) in their April 13, 2021 review of the EIR, where they stated that impacts to flying were not adequately addressed and that other alternatives should be explored. The SBSA also submitted a letter with line by line analysis of inaccurate information about free flight prevalent in the Subsequent MND. This letter was sent to you, Carpinteria City Council, on August 2, 2020 and to Nick Bobroff, Project Manager, on November 30, 2020 during the EIR scoping. Regardless, this language continues to plague the EIR. An Appendix has been provided with a list of these actionable mistruths.

Attachment 1

2. The Responses to Comments section in the EIR states that the airflow analysis report (*Airflow Analysis for the Proposed Regrading of the Rincon Bluffs*, Paolo Luzzatto-Feliz, PhD, January 22, 2021) is evidence of no significant impact to recreational soaring. However, the premise upon which this conclusion is based is patently false. To confront the issues inherent in this study, we realized an expert in the eyes of the City would need to provide testimony. We had already witnessed the Planning Commission summarily dismiss the expert testimony of dozens of pilots with hundreds of soaring hours at this particular site (Subsequent MND hearing). We decided to contact Dennis Pagen, who is quoted in the airflow analysis report itself and whose research is used by the authors. This is not a case of competing experts, but rather the same expert, trusted by the City to provide “evidence”, that is being asked to further evaluate and clarify the airflow models and their application. What Dennis points out is that the airflow analysis report is not an accurate or sufficient model because it ignores the depth and length of the ridge, the wind gradient, creation of turbulent rotor zones and venturis, and changes in thermal patterns. He concludes that the data used in the airflow analysis fails to represent the bigger picture and real-world conditions, and that it is predominantly based on sailplanes, which are rigid gliders with a wingspan up to 100ft that operate entirely differently from paragliders and hang gliders. If the EIR is declaring no significant impact to soaring recreation, a more accurate model is required to make this case. Please see Dennis Pagen’s full letter in Appendix B.

3. CEQA requires all forms of recreation to be valued equally. The proposed M.U.T. runs counter to this criteria. The M.U.T. expands access primarily to bicyclists at the exclusion of paragliders and hang gliders. While bicyclists have access to many miles of recreational paths, the construction of this 0.2 mile section of the M.U.T. will effectively end most soaring opportunities in Carpinteria, significantly impacting the recreational use of countless pilots. This site is the one place in Carpinteria where coastal soaring pilots can pursue their passion and practice their craft, sharing the joy of free flight with residents and tourists alike. The EIR is not compliant with CEQA if it replaces established recreation of pilots with other users such as bikers. Likewise, the Planning Commission’s certification of the EIR simply to serve a greater number of estimated future users is not supported by CEQA. It prioritizes one group of users over another.

4. The scope of the EIR failed to evaluate alternatives, to avoid massive earthwork at this site. The Certified Santa Barbara County Coastal Land Use Plan asserts that "...recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment...shall have priority over uses requiring substantial alteration". According to this guidance, paragliding and hang gliding activities in Carpinteria should have priority over the current M.U.T. proposal to displace 96,040 CY and remove 85,521 CY of material because our recreational activities do not require alteration to the existing environment. The proposed project design is significantly damaging to the coastline (four proposed outflow drains to the beach), infringing on the Coastal Act, while excluding current recreational users. Alternatives that avoid cutting

into Little Diamondhead ridge, realignment of the “Dogleg,” of the bridge (inline with the southbound US 101) should be considered, and formally analyzed.

5. The selected Alternative #3 is focused on providing a “blue ocean view” rather than a safe, useful, esthetically pleasing, less costly and less environmentally intrusive, more sustainable alternative. There is no plan for maintaining this bike path after it's constructed on a 100 year old eroding seawall, where a railroad and highway easement have failed and been abandoned. There is also no plan for managing traffic in the already congested and incredibly steep Rincon Beach parking lot where the bike path terminates. This design needs to be reassessed from the perspective of the very groups it's trying to help. It was cited in the bicyclist survey conducted by Ottis Gillespie (MUT Bicyclist survey pg 186 Dec 2021 EIR), that bicyclists preferred to have the proposed M.U.T. on the Southbound US 101 freeway side of Little Diamondhead. The City has not provided any detailed input from bicyclists, who are the most likely end users.

6. The California Department of Conservation has determined that there is an oil well within the proposed M.U.T. alignment that was not abandoned or capped properly for gas or water intrusion (p.140-144, EIR). The property owner becomes the responsible party for this oil well. It must be abandoned properly and remain accessible. Under the current design in Alternative #3, the M.U.T. will be constructed over the oil well. The California Department of Conservation may return at a later date to excavate down to the well to access it. This has a significant impact in cost, liability, noise, and construction. There is no such issue with the oil well when building the M.U.T. in accordance with Alternative #4, making it a better environmental option. Concerned citizens mentioned the presence of the oil well to the Planning Commission. Its potential short and long term impacts were not adequately addressed in the time available. An additional hearing and corrected EIR is needed.

7. The conceptual plans presented to decision-making authorities and to the public have differed between the Planning Commission meeting on January18, 2022 and the SBCAG meeting on January 20, 2022. While the Planning Commission reviewed EIR Alternative #3 with a straight cut into the ridge, the SBCAG presentation focused on a path with an ‘elbow’ bend toward the ocean. The significant differences between these conceptual plans is misleading and confusing. This lack of clarity is exacerbated by the ommission of engineer estimates and analysis for the EIR Alternatives, and the lack of line items describing details of the trail construction and materials. An appeal is needed to determine what aspects of the conceptual design are being proposed to the public and illuminate the key details such as trail alignment, and provide estimates for more accurate comparison of Alternatives.

Appendix A:
Corrections to the Final EIR of December 2021

Inaccuracy #1: free flight at Bates is an unsanctioned activity

a. We legally fly in this airspace as a recognized group by the Federal Aviation Administration (FAA) and United States Hang Gliding & Paragliding Association (USHPA). We have federal permission and legal authority to use this airspace.
b. Paragliding and Hang Gliding have been happening regularly at the Bates bluff for over 40 years and is fully established in this location. It is the only coastal soaring site in Carpinteria and the best known site, with consistent prevailing wind soaring between San Diego and San Francisco. Unique geographic features combine Southwest facing terrain with channel winds, allowing horizontal (laminar) airflow to be deflected upward at the bluff face of Little Diamondhead ridge. This is similar to the ocean swells that come into Rincon Point for surfing.
c. Little Diamondhead is special in allowing (in certain conditions) cross country flight. The Project site generates lift that allows pilots to transition to the surrounding bluffs and travel dozens of miles along the coastline, also making extended flights, slightly above the bluff face possible.
d. Exhibit 2 lists official rules governing free flight while also claiming it's an unrecognized and unsanctioned recreational activity. This is an obvious contradiction resulting from the City's selective use of the term "unsanctioned" to fit their needs. How do activities become publicly recognized? Are bikers or surfers sanctioned? No guidelines or examples are provided to address a shared location like Bates.
e. Exhibit 2 states there are safety hazards regarding the freeway and UPRR, yet no evidence is provided. Meanwhile, the EIR has no mitigation plan for the significant impact of bike traffic in Rincon Park caused by the Project. This congested area is already the site of numerous collisions (some cited by Council and Commission Members and public comments) that regularly occur between bicyclists vs. vehicles, vehicles vs. bicyclists, vehicles vs. pedestrians, bicyclists vs. pedestrians.
f. Exhibit 2 states that flying at Bates is questionable because foot traffic across the UPRR is restricted. However, pilots are flying over this alignment, not crossing the railroad by foot. There are no airspace restrictions relevant to our activities and our recreation in this area has been supported by expert testimony of FAA members during the Subsequent MND hearing. It should be noted that significant numbers of bicyclists and hikers are crossing the UPRR near the seal Rookery, where they are funneled by existing dirt trails of the Carpinteria Trail Head Bluffs (map shown on the City's website). Where is the project to mitigate these infractions?
g. FAA officials and career airline pilots provided expert testimony during the MND and EIR hearings to confirm that no aviation rules are being violated at this site.

2. Inaccuracy #2: the preferred launch site disqualifies free flight from CEQA
    a. The Rincon Trail Project has no bearing on the current launch locations, it is outside the scope of the project and irrelevant.
    b. The ownership status of the launch location parcels is subject to change before, during, and after the project, and should not factor into the EIR.
    c. Pilots have the capacity to launch from public and private locations to begin flying activities at Little Diamondhead, at times launching from National Forest property. However, flight can only be maintained at Little Diamondhead if the existing geological features remain intact.
    d. 5On rare windy days, pilots launch from the county property portion below the bluff, which is not in the Rincon Beach County Park or any private property.
    e. The Certified Santa Barbara County Coastal Land Use Plan adopted in 1982 states "...recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment...shall have priority over uses requiring substantial alteration." According to this plan, whether the land is public or private, free flight in Carpinteria should be given priority over this M.U.T. because our recreation requires no alteration to the environment.

3. Inaccuracy #3: the Project will not have a negative impact on uplift and airflow
    a. During the Public Workshop, MND hearings, and EIR hearings, SBSA provided expert testimony and evidence from engineers and FAA officials to substantiate the M.U.T. 's negative impact on uplift and airflow.
    b. SBSA created a video "Preserve Free Flight at Bates Bluff," by Aaron Laplante, local certified pilot, describing in detail how the M.U.T. will drastically affect airflow. This video was provided to the Planning Commission and City Council and proponents of the plan, and was discussed at length during the MND hearing: https://www.youtube.com/watch?v=SVIdEfWHMpE&t= .
    c. Despite SBSA's efforts, Exhibit 2 states that the flying community has not provided evidence of negative impact. This inaccurate conclusion is made without acknowledgement of what SBSA already provided and without explanation of what more is needed.
    d. The City has not demonstrated or reasonably proved that this M.U.T. will not significantly change vertical airflow or address the concerns of all current users. There is no proof that this project will not ruin a treasured flying site that has been lovingly used for decades.
    e. Exhibit 2 claims that the M.U.T. will not have a negative impact on airflow. No expert testimony, data, or evidence is provided. It also appears that Exhibit 2 confuses our sport with parasailing, which is a separate activity involving a boat. See Dennis Pagen's letter in Appendix B which further refutes the airflow analysis report.
    f. Exhibit 2 states that the M.U.T. will improve uplift, yet no reasonable proof is provided. Wind gradient models are readily available online and SBSA is willing to further demonstrate how uplift is less productive at lower elevations and

severely disrupted by a bench (in terms of width) like the one (twenty- two feet wide which includes a grated concrete "V," ditch) proposed. Below are two online articles that speak to soaring dynamics in areas of ridge lift.
Ridge Lift Research: http://journals.sfu.ca/ts/index.php/ts/article/viewFile/608/571
Ridge Soaring: https://chessintheair.com/what-conditions-produce-good-ridge-lift/

g. Exhibit 2 wrongly suggests that uplift is equal across all seaside bluffs in the area. While pilots may launch from a lower bluff, rarely is there enough uplift to sustain flight. Pilots immediately transition to the Little Diamondhead ridge, which has a steep, unobstructed face that generates adequate lift in a wide range of wind conditions. The Torrey Pines Gliderport (TPG) study cited in the December 2021 EIR (11032 2.5) was inaccurately portrayed and compared to the two distinct Bluffs in Carpinteria. The approximately 300 foot tall, sheer cliff face at TPG, correctly concludes that "launching," is easier to perform in lighter horizontal, deflected upward, wind conditions. This is applicable to wing inflation and "soaring opportunities," at the one, long continuous terrain feature of TPG. Wing inflation for "launching," is similar in Carpinteria. However, with two distinct separate Bluffs, the "launching," activities occur at one Bluff, and the "soaring opportunities," occur at the Little Diamondhead Bluff due to the prevailing southwest wind (as cited in Aaron Laplante's video). Author of many books on paragliding, Dennis Pagen has also addressed this in his letter (with a submission pointing out inaccuracies of application of his studies) to the Planning Commission.
h. The Project will cause permanent damage to a unique, treasured flying site, yet there are no assurances it will withstand rising sea levels and increased storm activity on the unstable slopes where it's being proposed. The EIR of December 2021 has not demonstrated compliance with the Carpinteria Rising Sea Policy and does not account for long term maintenance or provide a plan for preventing eventual slope failure, which has already happened for the old railroad and highway.
i. The City has not provided substantial evidence and/or sufficient analysis of exploring any alternatives on either the north side of northbound US 101 or the north side of Little Diamondhead, which is aligned with the US 101 southbound side of the highway. These alternatives are preferred by most potential end users (see 2020 bicyclists survey administered and compiled by Ottis Gillespie on the King property) and will definitely save costs. If not for the blue view desire, the currently existing trail on the freeway could add a line of barriers (similar to the continuance of the trail, east of Bates Road) along the US101 South (which is 12 - 16 feet wide in some areas) and the same type barriers on the US 101 North (10-22 feet wide in some areas). Considering the one way nature of traffic flow this would accommodate a five foot wide path in each direction) to protect bicyclists between exits.
The "Environmentally Superior Alternative," (Alternative #4 April 13 2021 meeting) with additional comments added to correct the improper alignment of

the bridge and the extension of the path further east towards Bates Road has not been adequately addressed or compared or considered by the proponents.

j. The majority of questions and comments contained in the December 2021 EIR address specific inadequacies of the Draft EIR presentations and conclusions. The attempted responses to a majority of questions and comments of the December 2021 EIR, Focused EIR and the MND did not provided a reasonable response: by omission of facts, misstatement of facts, concealment and/or denial of potential, substantial environmental impacts, for the proposed M.U.T.,whether submitted by State agencies or groups or individuals.

k. Mitigation Measures AES-1 requires County Board of Architectural Review pages 226-228, 3.3.1 Existing Conditions: "The Carpinteria Bluffs are among the last remaining coastal open space areas within the County and are a prime example of undisturbed California Coastline." This will be ruined by a proposed environmentally intrusive, costly, unsightly reconfigured, reconstituted, land mass (which will obliterate the Little Diamondhead Bluff), with unsightly concrete slabs, vehicle traffic sized footprint, unsightly bridge (UPRR will require a fully encapsulated bridge), which will dump untreated stormwater runoff onto the beach, which will result in environmental damage to the beach.

l. Gary Mussel in his April 26,2021 letter (Letter 01 of the December 2021 EIR) "Draining onto the Beach." "Five (now four) new drainage pipes will…," "...may be creating gullies across the sand…" "The "...long term "gullification…" He writes about the environmental impact to the beach. "Removal of Concrete Brik-Brak," "...the concrete "brik-brak…slated to be removed as a safety hazard." The City's response, "... the concrete debris mentioned in the comment is associated with a former state highway and is not the responsibility of the project (hence, the M.U.T. proponents and lead agency, the City of Carpinteria) to remove these remnants." The city has stated that they are absolved from addressing any and all safety hazards, involving the former state highway, which encompasses the Little Diamondhead Bluff and proximal locations. Not wanting to respond to existing safety hazards is indicative of actionable neglect.

m. Planning Commissioner John Callendar's comments at the January 18, 2022 Planning Commission meeting at approximately 106 minutes of video recording of the meeting reference; impact to paragliding and hang gliding activities, at approximately 111 minutes of video recording of the meeting (VRM) reference to CEQA application of proper and accurate wind study for "soaring activities," and "significant impact," to flying activities, at approximately 119 minutes of VRM, reference to opposition of the wind study included in Draft EIR.

n. Measure "A," funds mis-allocated for a tourist attraction for potential neighboring hotels, instead of for a sustainable, direct, alternative transportation route.

o. Global Response 2 (two) clearly states that the goal is to, "...recontour manufactured slopes…, " with a remanufactured " recontoured slope." A "slope," is inclusive of the top, middle and bottom. With only approximately 160 feet in height, a fairly steep slope, a competent engineer could not make a calculation and or assessment that the significant earthwork intrusion on the middle, and

lower portion, would not compromise the top. With the scheduled removal of remnants of state highway (refer to response of Gary Mussell's April 26, 2021 letter), the city's likelihood for the Little Diamondhead Bluff to be obliterated is extremely high.

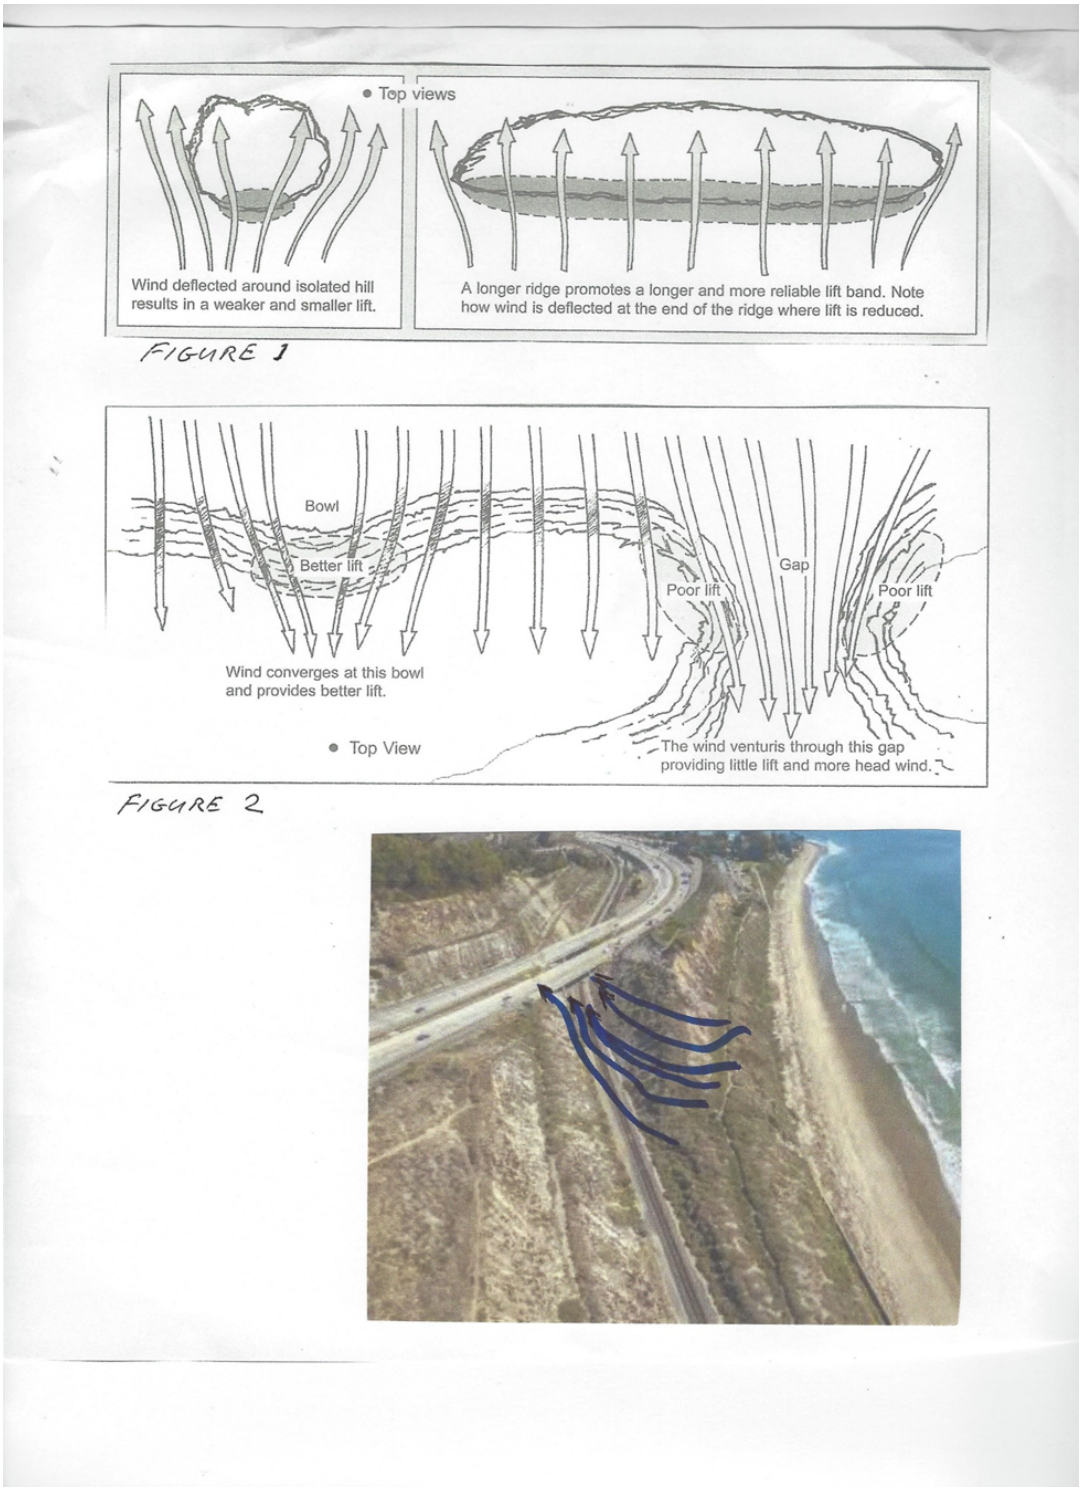
p. The early start (2018) of, and the completion of the foundation of the NW bridge "buttress," aka "foundation," violates all provisions for pre approval, environmental impact and required permits. The most likely reason, proponents desire the bridge to be aligned in one particular direction for Alternative #4 or #3 On page 115 of the December 2021 EIR
q. Inadequate response to Erin Maker at April 13 2021 ERC meeting. Her questions about the proposed project costs, vs. other project alternatives did not receive a detailed response or include any actual or projected costs. On page 212 of December 2021 EIR and page 2 of 8 Carpinteria Rincon Trail ERC meeting.
r. City's response to comment letter I-33 by Tim Barker. This response is not addressed to Mr. Barker and is an indication that the City has not taken comments about the inadequacy of the EIR seriously. Dismissive and "canned," responses are repeated throughout the "Responses to comment letter(s) " On page 190 of December 2021 EIR

Appendix B:
Letter from Dennis Pagen

January 17, 2022

To: City of Carpinteria Planning Commission
Re: Agenda Items #2, Rincon Trail Project

I am writing to offer information and opinions regarding the proposed Rincon Project and the intended alteration of the landscape to extend a bike path into the area in question. My interest and qualifications for commenting here are two-fold: I have been a hang glider pilot for 48 years and a paraglider pilot for 32 years. Also, utilizing my degree in engineering and physics, I studied micrometeorology intensively and wrote the book Understanding the Sky, which is used in many forms of aviation and is quoted in your EIR proposal. In addition, I wrote the book Art of Paragliding, which is also referenced in your document.



To begin, I have examined the various graphs and equations and find them to be reasonable and accurate, except for a few caveats, which I shall list and address below.

1. The most important misconception in this EIR analysis is that it is limited to two dimensions. In other words, it only looks at the vertical and incoming flow of the air. However, we all know that the flow of air is so fluid that it moves in all directions—forward and back, left and right and up and down. Because this site is limited in its width with respect to the incoming wind (perpendicular to the slope face), there will be some flow moving slightly sideways to escape into the opening or gap near the railroad tracks as a result of the extensive excavation needed to connect the bridge to the path. We can visualize this phenomena by thinking about a rock in the middle of a fast flowing stream. In this case we will see a bit of pile-up of water in front of the rock, while most of the water splits to flow around either side of the rock. The air flow around a protruding hill is nearly identical to this observed water flow. Figure 1 illustrates this effect.

If we further visualize a broader rock or perhaps a short wall perpendicular to the water flow, we will see that there will be more pile-up of water in front of the obstruction (wall), while there is still plenty of water that escapes around the sides of the wall. In the free air flow the wall is analogous to a ridge as opposed to a single hill limited in width. It should be clear that the wider the obstruction, the more it presents lift in front of it, and the smaller the percentage of flow that escapes around the sides compared to the total volume of flow meeting the obstruction face.

This natural behavior of water and air means that any alteration in the width of the small ridge at this particular soaring site will render it less soarable and undesirable as a flying site. In fact, it may become non-soarable except in a perfect wind direction (an infrequent occurrence at this site) or higher winds, which increases the inherent dangers. Not only is the lifting area reduced, but the increased flow into the proposed larger gap near the RR tracks will make it harder and

more dangerous to cross the gap to reach the higher, more soarable area of the ridge. It should be noted that all craft operating in a fluid (boats and aircraft) must point a bit into the flow in order to move in a direction crossing the flow. With a higher wind flow in this gap, the crossing will be slower and may not be possible at all if the glider's energy and altitude is expended in countering this increased air flow. Figure 2. Illustrates this matter.

Another factor that the three-dimensional flow introduces is that lift is reduced due to some sideways flowing of the air. So while the diagrams presented in the EIR purport to show a 10 to 20% reduction in lift, it will be a greater reduction if any amount of the ridge width is reduced. In other words, the graph presented are not representing the true effect of the proposed alteration of this site. When air flows faster in a constricted tube or through a narrow gap, it is known as a venturi effect. Pilots learn to avoid venturis because of the inability to penetrate against them and the possibility of stronger and even dangerous turbulence. This result is similar to an airplane flying into a jet stream with its extremely strong flow and often strong turbulence.

It is curious to note that while the EIR refers to many illustrations from my books, it does not reference any top view (plan view) illustrations, which provide the most meaningful understanding of the wind flow. For example, figures 13-7, 13-9, 13-10, et. al. in The Art of Paragliding clearly present the wind's behavior in gaps and along ridges. It's as if the analysis of a building's structure was presented only as side view elevation, without any top (plan) view or front elevation view. The limited information may be accurate, but is inconsequential in light of the need to fully understand the structure.

2. An additional error in the EIR is not taking into consideration the effect of wind gradient. The wind gradient is shown in the left vertical graph in figure 1 of the EIR. It shows the normal situation whereby the wind flow is slowed near the ground and increases as elevation increases (this slowing is due to friction and drag of the ground itself and ground objects, such as rough terrain, bushes, rocks, etc.). In brief, the wind gradient actually reduces the amount of lift created at the top of a slope—the greater the gradient, the less lift. What isn't mentioned in the EIR is that the flatter the slope, the thicker the layer of reduced flow is, so more lift is lost. As a side note, much of the lift at this site gets a boost from the heating of the beach area below. This heated air joins the general flow up the slope and makes it more buoyant. But with a flatter slope the rise of the buoyant air is not added to the general uplift as much because it tends to sidle along the surface rather than lift off due to the inertia of its mass (air weighs a surprising 0.08 lbs. per cubic foot). Thus, we can conclude that reducing the steepness of the slope will reduce lift more than the projected 10 or 20%.

3. The next point of concern is the added wind speed and turbulence caused by the alterations proposed. First, it should be pointed out that hang glider and paraglider plots would have to fly in the area where turbulence can form and pass through as a result of the bench cut into the bluff for the path. Thus they will experience ground turbulence. An increase in this turbulence will increase the dangers. The statement in the EIR that increase in turbulence shouldn't be a problem was probably influenced by the opinions of sailplane pilots who can handle stronger winds and turbulence due to their aerodynamic controls. In fact, in my experience throughout the world, I know of only two places that sailplanes take off close to the ground at the top of a ridge. Because hang glider and paraglider pilots must take off right at ground level, it should be clear that any added turbulence at this site can be life-threatening.

The EIR illustrates what appears to be a large eddy (swirl or rotor) at the bench area in figure 1 on the right side. This eddy is assumed to remain there out of play of the pilots launching or flying near the slope. However, experience has shown that such an eddy only remains stable in

lighter wind conditions when the wind is fairly perpendicular to the bluff face. In other conditions, the eddy can break away from its position at the bench, travel up the slope and become a serious hazard before it drifts downwind and gradually diminishes. In other words, the current profile of the slope presents a small eddy from the old RR bench that must be considered and countered by pilots flying at this site. But if a wide bench is created higher up the slope, or if the slope is reduced, the frequency of eddies impinging on the site will be increased, first by the deeper and higher bench resulting in more eddies, but more importantly by the fact that a lesser slope makes it easier for the eddy to break away and travel downstream, since it doesn't have to climb as steeply and do work against gravity.

4. Finally, it should be noted that the EIR references studies done in wind tunnels mainly as well as studies conducted by pilots from the sailplane community. Much of this data doesn't apply in the real world where matters can be and are often different than the closely controlled laboratory (as actually noted in the EIR). In fact, the best empirical data comes from the tens of thousands of flights conducted at this very site and more importantly from the hundreds of thousands of flights experienced by pilots of all sorts at many sites around the world that are very similar to the Rincon bluffs. Most pertinent to the point is that pilots of these small aircraft can fly very close to the terrain and gain much experience relating to the air flow and turbulence effects in real situations that cannot be duplicated in the laboratory and cannot be acquired any other way. So it is hard to understand why the local hang gliding/paragliding community wasn't consulted when this analysis was created. It would behoove all involved to proceed with this liaison in order to get a clear picture of the effect of the alterations and to understand how much the reduction of lift will diminish the possibility of this form of recreation.

Respectfully Submitted,

Dennis Pagen

January 28, 2022

Mr. Nick Bobroff, Principal Planner
Community Development Department
City of Carpinteria
5775 Carpinteria Avenue
Carpinteria, CA 93013

Dear Mr. Bobroff:

The focus has been on bike safety in the parking lot. I would like to addresss the area of Rincon Point Rd. (i.e. the end of Bates rd).

Plan 3, the plan adopted, will promote Bikers diangolnally crossing into the Rincon parking lot.

Even with a car one has to (or should) approuch the lot gingerly becausde of bad sight-lines. This will also make bikers more assesable to colliding with cars from the Rincon Point parking lot.

Also one must be aware of the increase of use of Electic bikes. Electic bikes are great because they have expanded the ridership range for biking. But it must be noted that Electirc bike riders tend to not be seasoned bike riders. This along with the fact the bikes go fast has made it a saftey situation. We have one person in our community that broke her back, during a crash becasue she couldn't control her bike. This also still encourages more bikers into the parking lot. There has been more than one collision. One even resulting in a broken leg.

If the bike trail continued on, the south bound 101, shoulder it could be easily marked with a straight path. There would be less confusion on where the bikes travel. I prefer a protected lane over ocean view. Especailly for such a short distance.

Also to utilize the south bound shoulder would not require the huge dirt removal, which environmentally damaging. And hopefully making the freeway route cheaper too?
Also would it be possible to have a tunnel for the Train Track crossing instead of a Bridge?

Thank you for your time,
With all my Biking Heart,

Helen O'Neill

Carpinteria, CA 93013

Appeal of Planning Commission Decision, Rincon Trail Project

To the Carpinteria City Council Members,

1. The selected Alternative #3 is focused on providing a “blue ocean view” rather than a safe, useful, esthetically pleasing, less costly less environmentally intrusive, more sustainable alternative. There is no plan for maintaining this bike path after it's constructed on a 100-year-old eroding seawall, where a railroad and highway easement have failed and been abandoned. There is also no plan for managing traffic in the already congested and incredibly steep Rincon Beach parking lot where the bike path terminates. This design needs to be reassessed from the perspective of the very groups it's trying to help.

A1-1

1. The conceptual plans presented to decision-making authorities and to the public have differed between the Planning Commission meeting on January 18, 2022, and the SBCAG meeting on January 20, 2022. While the Planning Commission reviewed EIR Alternative #3 with a straight cut into the ridge, the SBCAG presentation focused on a path with an ‘elbow’ bend toward the ocean. The significant differences between these conceptual plans are misleading and confusing. This lack of clarity is exacerbated by the omission of engineer estimates and analysis for the EIR Alternatives, and the lack of line items describing details of the trail construction and materials. An appeal is needed to determine what aspects of the conceptual design are being proposed to the public illuminate the key details such as trail alignment and provide what real alternatives can provide.

A1-2

2. Since the EIR gives no real engineering info or Documentation on Alternative (#4) which places the Bike path on the north side of the Bluffs. There is no way to provide a real comparison of the different alternatives

A1-3

1. The EIR report now is showing another extension to the bike bath leading thru the parking lot of the county park leading all the way to Bates Rd.
1. This 14ft wide path with 2 ft side lanes requires more concrete walls and a lot more dirt work all the way to Bates road, Making the pike path some 1000s of feet longer thru the Park.

A1-4

2. There is an abandoned well in the middle of the trail that has not been properly abandoned and caped as documented in the EIR.
1. The California Department of Conservation has written (A} that there is no oil/gas zone plug (B) There is no freshwater plug. © There is no casing shoe plug. (D) there is no surface Plug. This is shown in the

A1-5

EIR The construction of alternative 3 will cover the well and involve a lot of liability and cost. A1-5 cont'd

2. Coast Act 30240 requires Envirmrntal sensitive Habitat areas to be protected to the maximum extent possible. The EIR has documented 3 protected plants specifically that will be significantly impacted that are in the footprint of the trail on option (3). As stated in the EIR there is no way to mitigate the impacts of these plants as they have a low survivability after being moved. A1-6

3. Option (3) also requires removing a Large Monterey Pine tree in the middle of the trail before the parking lot along with other trees. A1-7

All of these impacts from selecting 3 as the least impactful are not true as stated in the EIR. The city is wanting to build on option 3 so have tried to make it look like it's better. A1-8

A statement that option 2 could not be used as it's in an earthquake zone is true as the whole area is in this zone. Not just option 3. The earthquake zone runs from south of the Venture County line up into Carpinteria as stated in the documents. A1-9

Option 4 does not have plant impacts, or as much earth work when including the extra work needed to build option 3 bike path thru the county Park. A1-10

Option 4 does not need as much large slope work done as it follows the grade of the bates offramp. Similar to the Summerland Bike Path next to the Highway. A1-11

The EIR is not complete as it does not fully document all of the impacts of all of the options that a truly informed decision can be made. A1-12

I am requesting an Appeal of this EIR and Conditional Use Permit and a Coastal Development Permit for the proposed Multi Use Trail (M.U.T.), Rincon Trail Project 19-2015-CUP/CDP.

I await your response

Thanks, Karl Cameron

Response to Appeal Letter A1

Karl Cameron
January 28, 2022

A1-1 The Planning Commission selected Alternative #3 on the basis that the Final EIR determined this Alternative to be the environmentally superior alternative that satisfied a majority of the Project Objectives. (Planning Commission Staff Report, Exhibit 1, Attachment A ("Findings for Approval"), § 1.2.c.) Below summarizes staff's additional response to items raised in Appeal Statement A1-1:

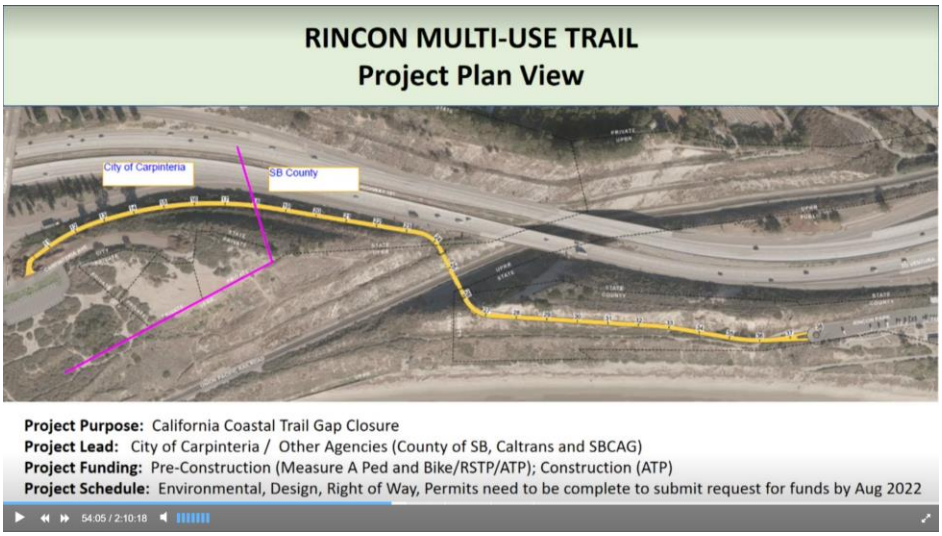
One key concept of the proposed design is "safety". The trail is being designed by registered professionals in accordance with the current engineering standards and practices. Consistent with Project Objectives, the trail has also been designed to be usable by the broadest segment of the population as possible, including pedestrians and cyclists. The majority of the trail has also been designed to meet Americans with Disability Act ("ADA") standards; the short section of the trail that would exceed ADA slope standards was done to reduce landform modification of the bluff face and attempt to balance the many interests concerning this Project.

In terms of aesthetics, staff believes that traveling a path which is detached from a very heavily traveled and noisy freeway corridor and instead using a trail which also provides a "blue ocean view" is universally accepted as more "aesthetically pleasing", compared to Alternative 4, for example. Further, the trail has been designed to be as minimally visually intrusive as possible. The trail traverses manufactured slopes that are already interrupted with one or more benches, which the new trail bench would mimic. Likewise, the overall character of the bluff faces would not be drastically changed, including the overall height of the bluff features. Lastly, the Project is required to be reviewed by, and receive approval, from both the City's Architectural Review Board ("City ARB") and the County's Board of Architectural Review ("County BAR"), prior to obtaining final permits and beginning construction, to ensure that the Project's design details meet the City and County standards. As part of the architectural review processes, design details such as bridge colors, railing design, and fencing materials can be refined to best fit the character of the setting.

Project cost is not part of the consideration of the California Environmental Quality Act ("CEQA"), nor does it factor into the planning department's policy consistency analysis. (See Cal. Code Regs., tit 14 ("CEQA Guidelines"), § 15382.) Nevertheless, the other Project alternatives also have components which would be very costly to build. In the case of Alternative 2, complicated retaining walls, built over unstable landforms, are significantly more costly to construct;

Alternative 4 would require much more retaining wall as well as considerable earthwork. It is important to understand that these features, which would be built adjacent to busy freeway traffic would also require much more traffic control which would add to overall Project costs. As a case-in-point, note the current construction activities on U.S. Highway 101 which give a contemporary example of the traffic control which would be required for a freeway-adjacent project. This traffic control brings added complexity and risk, thereby adding cost to Alternative 4.

Engineers have performed a variety of studies to select the preferred alignment and bluff slope profile. “Sustainability” is a key concept of the design in terms of ensuring the trail would be geologically stable, including being sufficiently set back from the bluff face to account for projected coastal bluff retreat over the anticipated lifetime of the Project. Please refer to response to comment no. A2-33, below, for more information on projected coastal bluff retreat. However other stakeholder interests, including those who desire to minimize earthwork, specifically the “Soaring Community” have also shaped the design.



Ongoing maintenance of the Project would be the co-responsibilities of the City and County. A formal trail maintenance agreement must be executed by both entities prior to initiation of construction and will detail the ongoing maintenance obligations of both jurisdictions for all trail elements, including but not limited to the new bridge crossing, concrete paving, and fencing/railings. Ongoing maintenance concerns are one reason Alternative 2 is less attractive than the proposed Project.

As discussed elsewhere in the response to the appeals in greater detail, the City’s consulting traffic engineer reviewed the proposed plans in relation to the existing conditions in the Rincon Beach County Park (or “County Park”) parking lot, and concluded that the introduction of additional cyclists and pedestrians into an existing slow speed, mixed-vehicle travel area would not pose a significant safety hazard (see response to comment no. A2-11, below). Nevertheless, the City and Santa Barbara County Association of Governments (“SBCAG”) are working with the County to develop a possible plan for routing cyclist thru-traffic through the parking lot. However, because of the scope, and timing of the large Rincon Trail Project, the County’s conceptual plan for future updates to the Rincon Beach County parking lot project would be considered as a subsequent, separate project. Please see response to comment no. A1-10, below, for additional information on alternatives.

A1-2 The SBCAG presentation focused on providing relevant background to SBCAG Boardmembers concerning Project status, including the most recent action by the City Planning Commission, and options for committing additional funding to the

Project to support the completion of working drawings and readying the Project for construction.

The emphasis of the presentation was on funding options and not on the particulars of the Project design, including trail alignment. Nevertheless, the staff presentation included an overview graphic generally depicting the proposed alignment as described in the Project EIR (see graphic below from SBCAG staff presentation).

The same graphic was included in the Carpinteria Planning Commission staff report packet, both as part of Exhibit #4 and on the cover page of the staff report itself. It was also shown in the staff presentation at the Planning Commission hearing. Additionally, the engineered plans included in the Planning Commission staff report as Exhibit B to Attachment 1 reflect the same proposed alignment as what is shown in the above overview graphic.

The important distinction is that the Planning Commission staff report ***also*** presented the Alternative 3 option to the Commission for consideration, which was identified in the EIR as the environmentally superior alternative. The Alternative 3 option employs nearly the same alignment, except for the easternmost portion of the trail where it instead descends at a slightly steeper slope (6% instead of 5%), arriving at the historic abandoned railroad bench at a more westerly point and utilizing this existing bench to connect to the Rincon Beach County Park. An updated “concept” design showing this minor alignment change is depicted as Figure 6.2 in the Final EIR. Beyond this concept design, the working drawings for “Alternative 3” have not yet been completed.

Therefore, the Project as presented to both the Planning Commission and SBCAG depicted the same proposed Project. The Planning Commission,

however, voted to move forward with the Alternative 3 design, in light of its reduced impacts to the environment compared to the proposed Project and other Project alternatives evaluated in the EIR.

A1-3 The City, as the lead agency, has the discretion to consider a reasonable range of alternatives that would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the environmental effects of the Project. (CEQA Guidelines, § 15126.6(a) & (d); *City of Maywood v. Los Angeles Unified Sch. Dist.* (2012) 208 Cal.App.4th 362, 414; *South of Market Community Action Network v. City & County of San Francisco* (2019) 33 Cal.App.5th 321, 345.) The level of analysis of each alternative also is subject to a rule of reason and does not need to be an exhaustive evaluation of each alternative. (*Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 547.) An EIR need only contain sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. (*Id*.; CEQA Guidelines, § 15126.6(f).)

As discussed in Section 6.6.4 of the EIR, the design engineers created an alignment for Alternative 4 using the same trail specifications as the Project, including paved width, trail surface slope not greater than 5%, and connecting the point where the trail alignment crosses the UPRR tracks to a point near the existing bike path facility at Bates Road. The engineers provided calculations of the earthwork volumes, including export of earth materials, for Alternative #4. The calculated earthwork volumes were used to determine relative impacts in the areas of air quality, greenhouse gas emissions, geology, hydrology, and noise. Dudek biologists and archaeologists also provided additional survey work to address Alternative #4 in the Final EIR.

Accordingly, the EIR contains sufficient information to evaluate the Alternative #4 relative to this Alternative's ability to achieve the project objectives and lack of potentially significant environmental effects associated with the proposed Project. (See CEQA Guidelines, § 15126.6(a); *Sierra Club*, 163 Cal.App.4th at 547-548.)

Please see response to comment no. A1-10, below, for additional information on alternatives.

A1-4 Neither the proposed Project, nor the environmentally superior alternative (Alternative 3), as both are described in the EIR, include an extension of the proposed trail through the parking lot of Rincon Beach County Park. The Transportation section of the Draft EIR (section 3.12.4) acknowledges that County Parks staff and SBCAG staff have held several meetings to discuss a possible future separate project that could route cyclists wishing to continue south past Rincon through the County Park to Bates Road, however the

discussion in the Draft EIR makes clear that such a connector trail is not proposed as part of the current Project, nor is it required as a mitigation measure for the Project. A preliminary proposal to study such a connector trail is included in the Draft EIR as Appendix K. "County Connector Trail Proposal- Rincon Park Project Components Study" prepared by Bengal Engineering (see Attachment C, Exhibit 3). (See additional response to comment nos. A1-1, above, and A1-10, below.)

The Alternative 4 Project, as described in both the Draft and Final EIRs, includes a continuation of the trail all the way to Bates Road. This continuation of the trail would extend the overall length of the trail by approximately 1,200 feet compared to either the proposed Project or Alternative 3 design, and would likely require retaining walls for some portion of this additional extent. However, the Alternative 4 design contemplated in the EIR remains on the highway side of the "Bates Ridge" for its entire length and does not, as currently conceptualized, encroach into County Parks property.

A1-5 While the Geologic Energy Management Division ("GEDM") response identifies recommendations for properly abandoning oil wells consistent with current standards, it fails to acknowledge that the well of potential concern (API: 0408304324) was a dry hole. This means that no oil was encountered during the exploratory drilling, and the well was therefore immediately abandoned. The well record indicates the status of the well as "plugged" which, at the time the well was drilled, would have simply involved backfilling with the removed earth material. GEDM indicates they have no record of an oil/gas zone plug, freshwater plug, casing shoe plug, or surface plug for the well, which is to be expected from a dry hole that was abandoned prior to the adoption of the rigorous abandonment standards that exist today. (Cal. Pub. Res. Code § 3208(a) (2020)). It is unlikely that a casing was even installed for this well, but if there is a casing encountered during Project grading, it would be a simple matter to cut the casing at an elevation below the surface of any site improvements, and to plug the casing with concrete. There is no public health risk associated with this abandoned dry hole.

Also, given the lack of a known and precise location of the abandoned well, and the history of transportation facility development in this area, it is highly unlikely that the well of concern is located within the alignment for the Rincon Trail. Refer to Exhibit 1, Rincon Abandoned Well Data from the California Department of Conservation "Well Finder" website for more information.

In addition, Condition of Approval No. 46 for the City's Conditional Use Permit and Coastal Development Permit ("CUP/CDP") for the Project requires construction activities to comply with any other applicable governmental requirements. As such, if the abandoned well exists along the project alignment,

the project team will need to comply with all applicable federal, state and local requirements to address the abandoned well in order to comply with this condition..

A1-6 Coastal Act §30240 states:

> "(a) *Environmentally sensitive habitat areas ("ESHA") shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas.*
> (b) *Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas."*

According to the analysis provided in the Final EIR (section 3.3), three special status plant species (cliff malacothrix, woolly seablite, and south coast branching phacelia) were detected within the biological survey area. While these plants are listed by the California Native Plant Society's ("CNPS") "California Rare Plant Ranks ("CRPR")," they are ranked as 4.2 and 3.2, respectively, which are "rare" but not considered to be special status species for the purposes of CEQA, but do add to vegetation community value designated as ESHA. Plants with a threat ranking ending in 0.2 are considered to be "moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)." No federal, state, or CNPS CRPR 1A, 1B, 2A, or 2B plants, or locally rare plants, were identified within the biological survey area for the Project.

Given this ranking and lack of classification as being locally rare and the limited extent of impacts to the identified species not being significant enough to transfer the species to a more sensitive rank, these impacts were found to be less than significant. Based on these findings, no mitigation is required for the impacts to these specific "rare" plant species. Mitigation is, however, required for potentially significant impacts to specified ESHA plant communities as described in section 3.3.4 of the Proposed Final EIR (Attachment C, Exhibit 1) and the Draft EIR (Attachment C, Exhibit 2).

A1-7 There are several trees, including two Monterey Pines, which may be impacted by the proposed Project. One of the Monterey Pines (10" Diameter at Breast Height ("DBH")) is located near the western terminus of the trail; the other (12" DBH) is located within the proposed trail alignment within Rincon Beach County Park. The 10" Monterey Pine would potentially be equally impacted by any of the Project alternatives, as they all share the same route west of the Union Pacific Railroad ("UPRR") crossing. The 12" Monterey Pine would likely be impacted by the proposed Project or Alternatives 2 or 3.

These potential impacts were disclosed in the EIR (section 3.3). However, as Monterey Pines are not native to the area, and these specific trees were not found to be provide important habitat for wildlife, the biological resource impacts of removing one or both of these trees was found to be less than significant.

A1-8 The EIR prepared for the Project provides objective, measurable analysis of the potential impacts of the proposed Project and identified mitigation measures and/or Project alternatives, wherever feasible. As demonstrated in the analysis provided in the EIR, Alternative 3 results in the least severe impacts, overall, from amongst the proposed Project and considered alternatives.

Where a potential environmental impact was found to be less than significant, no further analysis was necessary to determine whether a given Project alternative could further reduce the severity of any identified impacts. In the case of Class II, significant but mitigable impacts, the EIR demonstrates that by further reducing earthwork quantities by slightly narrowing and steepening a portion of the trail, as described in Alternative 3, impacts to biological resources, geology/soils, water quality, greenhouse gas emissions, and air quality, can be slightly reduced as compared to the proposed Project.

Note, these further reductions in the severity of impacts are not strictly required to be implemented since all identified Project impacts were found to be feasibly mitigated to less than significant levels. Nevertheless, the Planning Commission found Alternative 3, as the environmentally superior alternative, to be the preferred Project to proceed with based on the substantial evidence presented in the EIR.

A1-9 As discussed in section 3.5.1 of the EIR, the entire Project area is located in a seismically active region subject to potential impacts from seismic activity along one or more faults in the area (although none are currently deemed “active” and the area is not included in any Alquist-Priolo Special Studies Zones).

However, as discussed generally in the description of Alternative 2 (section 6.5 of the EIR), and in further detail in the Project-specific geotechnical report (EIR Appendix E), an area of historic landslide activity was identified southwest of the proposed trail alignment, south of the UPRR crossing. This area of ancient landslide activity is located in the area of the large “switchback” feature of the Alternative 2 trail alignment, where approximately 1,000 linear feet of retaining walls, up to 14’ in height, were expected to be needed to construct the trail through the area given existing topography and grade differences. In order to stabilize the large landslide feature in the area, multiple deep caissons would be required to attempt to pin the mass in place. Nevertheless, movement could still

occur between the caissons. Given the cost and constructability challenges posed by the historic landslide area, the Project team sought out alternative alignments that avoided this landslide area.

A1-10 Alternative 4, as described in the EIR, would result in greater impacts to biological resources and geology/soils, as a product of its extensive additional length (which extends to Bates Road), when compared to the proposed Project or the Alternative 3 alignment. As previously discussed, both the proposed Project and the Alternative 3 alignments terminate at the westerly terminus of the Rincon Beach County Park parking lot. There currently is no continuation of the trail through the County Park proposed at this time, nor is such a continuation of the trail required as mitigation for any impacts identified for the proposed Project.

While County Parks staff has discussed the possibility of a future trail through the County Park, the location, design, and alignment of such a trail has not been determined at this time. An agency is not required to consider environmental impacts of a "specific future action that is merely contemplated." (*Laurel Heights Improvement Assn. v. Regents of Univ. of California* (1988) 47 Cal.3d 376, 398.) To qualify for environmental review, the plans must have matured into a specific commitment, but where the future development is uncertain, evaluation of future environmental impacts associated with that development "must await the future decisions that could cause the effects." (See *Topanga Beach Renters Assn. v. Department of General Services* (1976) 58 Cal.App.3d 188, 196.) As such, a conceptual, future project to improve the Rincon Beach County Park and improve bicycle and pedestrian access to the Pacific Coast Bikeway and the Ventura County portion of Rincon Beach is outside the scope of the review for the proposed Project. It also cannot be accurately concluded that Alternative 4 would have fewer or less biological resource impacts or earthwork quantities than either the proposed Project or Alternative 3, even if combined with an as-yet undetermined possible future trail or other improvements in and through the County Park.

Further, courts also use an "independent utility" to evaluate the relationship between multiple projects. Specifically, courts look to whether the projects (1) have "different project proponents"; "serve different purposes"; or "could be implemented independently of each other." (*Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1226.)

Even if the County's conceptual plan for improvements to Rincon Beach County Park were available for incorporation into the EIR, the proposed Project and the Rincon Beach County Park improvement plan would have sufficient independent utility to separate environmental review. First, the County would be the lead agency and project proponent for the environmental review of the County Park

improvement plan. Second, the proposed Project serves an independent purpose by providing non-vehicular access from the Carpinteria Bluffs to the Rincon Beach County Park consistent with the conditions for approval for the Linden Avenue and Casitas Pass Interchanges and Via Real Extension Project (No. 09-1522-CUP/CDP). Third, the proposed Project and potential improvements to the Rincon Beach County Park each serve a different purpose, i.e., improving non-vehicular public access and improving the park facilities, respectively. (See, e.g., *Del Mar Terrace Conservancy, Inc. v. City Council* (1992) 10 Cal.App.4th 712, 732-734; *Aptos Council v. County of Santa Cruz* (2017) 10 Cal.App.5th 266, 279-285.) As such, the EIR properly evaluates the proposed Project separate from the potential future improvements to Rincon Beach County Park, it does not necessitate additional improvements to Rincon County Beach Park other than those already contemplated in the EIR, and environmental review and consideration of potential improvement plans would be speculative at this time.

A1-11 This statement is not true. In terms of “slope work”, Alternative 4, which is much longer than the proposed Project, or other alternatives, including the preferred alternative, would require more “slope work” to build: about 30% more earth would be exported to cut the trail on the existing slopes. In addition, a considerable amount of retaining wall will be required to locate the trail on the bluff face in between the County parking lot and the Southbound off ramp at Bates Road. As a related topic, to build Alternative 4, some of this wall could be difficult to build, or could require relocation of the “new” sewer force main which pumps sewage from the Rincon Point community uphill toward Highway 150.

A1-12 City staff has made a good faith effort to identify and evaluate the significance of all potential Project-related environmental impacts. (See CEQA Guidelines, § 15003(i); 15151 [“An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences.”].) .) Potential impacts identified during the environmental scoping phase of the EIR were evaluated and addressed in the EIR. The City’s response to comment no. A1-3, above, provides further discussion of the evaluation of the Project alternatives. Likewise, comments received during the public review period of the Draft EIR have been addressed and incorporated into the Final EIR.

The majority of the Planning Commission present to hear the item found the Final EIR to have satisfactorily met the requirements of CEQA and voted to accept and certify the EIR as such.

Re: *Project # 19-2015-CUP/CUP, State Clearing House No. 2020100582 - Appeal of Certification of Carpinteria Rincon Trail Project EIR and Project Approval*

ORBACH HUFF + HENDERSON LLP

Gentleman and esteemed City Councilmembers:

On behalf of the Santa Barbara Soaring Association ("Association"), we hereby tender the Association's appeal of the City of Carpinteria Planning Commission's ("Planning Commission") certification of the Final Environmental Impact Report ("EIR") and approval of the Rincon Trail Project ("Project") under Agenda Item 2 at its January 18, 2022 meeting, pursuant to Carpinteria Municipal Code section 14.78.040.

The grounds for appeal are as follows:

(1) The Planning Commission wrongly determined that the Project's impact on the wind intensity and patterns at the Project site and its surroundings is not an impact on the environment;

(2) No threshold of significance was established for the Project's impact on wind that the Freeflight community relies upon to participate in the recreation of freeflight;

(3) The EIR failed to identify the substantial alteration of the Project site to be as significant view impact;

(4) The Planning Commission improperly considered the lack of the Association's property rights at the Project to justify destroying the freeflight recreation at the Project site; and

(5) The Planning Commission failed to recognize that Alternative 4 is the least environmental damaging alternative, other than the No Project Alternative.

THE PROJECT.

The Project would reduce a scenic vista coastal bluff to molehill by removing a whopping 107,386 cubic yards of the bluff. (Draft EIR, § 2.7.1, p. 2-10.) The Project would create a "16-foot trail" made of concrete to accommodate emergency and maintenance vehicles. (*Id*. p. 2-15.) Merriam-Webster defines "trail" to be "(1): a track made by passage especially through a wilderness [¶] (2): a marked or established path or route especially through a forest or mountainous region." (https://www.merriam-webster.com/dictionary/trail.) Make no mistake about it, this concrete monstrosity is not a trail, but a road. (https://www.merriam-webster.com/dictionary/road "2 a: an open way for vehicles, persons, and animals.")

THE ASSOCIATION.

The Association is a group of persons engaged in the recreation of "freeflight," which is flight that does not utilize a motor, but instead capitalizes on the wind in order to stay aloft. The Association has been flying paragliders and hang-gliders at the Project site's ocean bluff for 40 years. The Project site provides one of the only few ocean ridge lift sites available in California for freeflight recreation. With the constant prevailing wind off the ocean and steepness of the ocean bluff, Association members are able to fly or "soar" for hours at a time, providing a recreational respite for the Association's members. The Association welcomes all who wish to engage in freeflight.

We have been vocal concerning this Project over the years. Our member, Otis Gillespie, filed the first appeal to City Council when he demonstrated that a mitigated negative declaration was not an adequate environmental review document. We have raised our concerns at the public meetings, city meetings, and have commented on the Final EIR. (Ottis Gillespie submitted Letter Nos. I-8, I-11, I-21, and I-32; Jeffrey Longcor submitted Letter No. I-27; and Rob Sporrer submitted Letter No. I-31; Final EIR p. 2-2.) Unfortunately, none of their letters were included in the Final EIR. Instead of directly addressing our Association members' comments, the Final EIR simply includes Global Response GR1: Impacts Upon Soaring Opportunities/Airflow Study. (Final EIR, pp. 2-4 through 2.6.) Unfortunately, this response fails to recognize the Project's impact on winds affecting freeflight as an environmental impact.

1. THE PROJECT'S IMPACT ON WIND AT THE PROJECT SITE IS AN IMPACT ON THE ENVIRONMENT.

A. Wind Is Part of the Environment.

On page 3.11-8, the Draft EIR states, "Although the air space above the proposed trail is not a public recreational facility for the purposes of the CEQA Guidelines…." Not only is this untrue, but it the unique character of the ocean bluff, with the Project Site that creates the public recreational facility of freeflight. It is common sense that wind is part of the environment, even if you cannot see it. "Environment" is defined by the CEQA Guidelines as, "[T]he physical conditions which exist within the area which will be affected by a proposed project including land, ***air***…. The 'environment' includes both natural and man-made conditions." (CEQA Guidelines, § 15360, emph. added.) We cannot see air quality impacts, but they definitely exist and are extensively studied under CEQA. It is beyond understandable how the Planning Commission can make such an outlandish determination that wind is not part of the environment, and paragliding and hang-gliding are not recreational activities reliant on a facility.

A2-1

On page 3.11-9, the Draft EIR contends that decreasing the recreational activity of freeflight is nothing more than a social or economic change. This is an absurd conclusion. Recreational activities are clearly part of the protected environment under CEQA. One need only look no

further than the Initial Study Checklist at Appendix G of the CEQA Guidelines that identifies "Recreation" as an environmental factor potentially affected by a project.

A commenter challenged the statement that there would be no significant impact on soaring activities and the Project's wind impact would destroy the recreational freeflight at the Project site. (Final EIR, Comment Letter I11-4, pdf p. 113.) Another commenter made the same challenge. (*Id*. Comment Letter comments I27-4 and I27-5, pdf p. 157.) Yet another comment made similar challenges. (*Id*. Comment Letter I31.) In response, the Final EIR points the reader back to Global Response GR1. A2-1 cont'd

Unfortunately, Global Response GR1 improperly continues to contend that the Project's impacts on the wind supporting the recreational activity of freeflight is not an environmental impact. (Final EIR, p. 2-6.) The Planning Commission cannot make an informed decision on the Project until it understands that the Project's impact on wind supporting freeflight is an environmental impact.

B. Dudek Is No Expert on Wind.

Nowhere in the record has Dudek demonstrated that it has sufficient expertise to analyze or opine on the Project's impact on the wind relied on by the freeflight community. Moreover, the "Airflow analysis of the proposed [sic] regarding of the Rincon Bluffs" in Appendix I (the "Rincon Airflow Analysis") does not demonstrate that Paolo Luzzatto-Fegiz is an expert in wind dynamics or soaring flight. His inexperience is demonstrated by the incomplete study, which fails to use generally accepted scientific and soaring principles to calculate and analyze the impacts of wind reduction on freeflight. In a January 16, 2022 letter submitted to the Planning Commission, renowned micrometeorology and freeflight expert Dennis Pagen, whose work is cited in the Rincon Airflow Analysis itself, explains that the Rincon Airflow analysis report is inaccurate because it ignores important factors like the depth and length of the ridge, the wind gradient, the creation of turbulent rotor zones and venturis, and changes in thermal patterns. He concludes that the data used in the Rincon Airflow Analysis fails to accurately represent the bigger picture and real-world conditions, and that it is predominantly based on sailplanes, which are rigid gliders with wingspans up to 100 feet that operate entirely differently from paragliders and hang gliders. A2-2

One of the more glaring oversights with respect to the soaring analysis in the EIR is the use of off-handed citations of operating wind speeds from the Torrey Pines Gliderport and USHPA website freeflight newcomer FAQ pages, to mistakenly arrive at a 50% wind speed operating margin, and thus conclude that the 30% reduction in vertical velocity calculated in the Rincon Airflow Study does not constitute a "significant impact" to soaring activities under CEQA.

Any soaring pilot will quickly recognize that the wind speeds cited on these basic, informational FAQ pages are not intended as a universal or scientific statement of the effect of wind speed on freeflight. A meaningful analysis of the significance of a given wind speed reduction on soaring

activities would consider information about aircraft type, flight regime, weather, actual wind speed and direction, and other factors. For example, a 30% reduction in wind speed from 15 mph to 10.5 mph from a perpendicular direction on a sunny day may not result in a significant impact for a launching paraglider. On the other hand, a reduction in wind speed from 10 mph to 7 mph from a cross-slope direction on a cloudy day will certainly impact a hang glider trying to sustain soaring flight. These facts and other soaring-related science was presented to the panel by Association pilots in public meetings, emails, and other fora, but the EIR failed to factor this record testimony into its analysis of the threshold of significance for soaring activities at Bates. Friends of Bates Beach raised concerns with the Draft EIR's analysis feeling that the 30% reduction in wind was improperly downplayed. (Final EIR, Comment O1-10, p. 62.) The response to this comment was simply to direct the reader to Global Response GR1, which continues to ignore the significant impact that a 30% reduction in wind would have on freeflight.

A2-2 cont'd

CEQA requires government agencies to use reasonable efforts, to consider the specific environmental context of a project, and to establish thresholds of significance. (*Protect the Historic Amador Waterway v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1105-12.) What might be insignificant to re-grading a random hillside becomes significant when a project jeopardizes 40 years of soaring history and the only coastal ridge soaring site for nearly 100 miles. The Commission failed to satisfy its burden to make a reasonable effort to translate a purported 30% reduction estimate into a corresponding impact on soaring activities, and to then assess whether that impact is "significant" under CEQA. In so doing, the Planning Commission has run afoul of CEQA.

2. <u>THE PLANNING COMMISSION FAILED TO SET A THRESHOLD OF SIGNIFICANCE FOR THE PROJECT'S IMPACT ON WIND.</u>

As discussed above, with the EIR's shocking claim that the Project's impact on wind supporting freeflight is not an environmental impact, the Planning Commission neglected to establish a threshold of significance to be able to discern whether the Project's impact on wind, and therefore, the recreation of freeflight. The EIR is incomplete and inadequate without a threshold of significance on the wind impact and analysis of whether that wind impact is significant.

A2-3

3. <u>THE PLANNING COMMISSION WRONGLY DETERMINED THAT THE PROJECT'S SUBSTANTIAL ALTERATION OF THE PROJECT SITE WOULD NOT CREATE A SIGNIFICANT VIEW IMPACT.</u>

The Draft EIR admits that the ocean bluffs are scenic vistas and resources. (*Id.* § 3.1.1.3, p. 3.1-2.) Two of the significance thresholds are "a) Have a substantial adverse affect on a scenic vista" and "b) Substantially damage scenic resources…." (*Id.* §3.1.3, p. 3.1-6.) The Draft EIR finds that the Project's impact to a scenic vista would be potentially significant, but with mitigation Measure AES-1, the impacts would be less than significant. (*Id.* § 3.1.4(a), p. 3.1-

A2-4

6.) Mitigation Measure AES-1 only requires a review and approval by the City's Architectural Review Board and County Board of Architectural Review. This is not mitigation by any shape or means and cannot mitigate the significant alteration of the ocean bluff to the tune of over 100,000 cubic yards of removal of a scenic vista. The Planning Commission cannot rely on this fake mitigation measure, and it should have found the Project's impact to the ocean bluff scenic vista as significant and unavoidable. The determine that the significant scenic vista impact would be less than significant by bare approvals of two review boards is simply in error and must be reversed.

The Association's Ottis Gillespie commented that the removal of 92,526 cubic yards from the ocean bluff would eliminate a regional coastal resource. (Final EIR, Comment Letter comment I32-3, pdf p. 180.) In response, the Final EIR points the reader to response I32-8, which mere responds that the comment does not raise any issue concerning the adequacy of the Draft EIR. No further response is required or provided. This is an improper response calling into question the conclusion that the elimination of a regional coastal resource would be less than significant.

A2-4 cont'd

The County of Santa Barbara Planning and Development Department commented that the EIR needs to discuss how the Project is consistent with the Coastal Act Policies. (Final EIR, Comment Letter L3-4, pdf pp. 75-77.) Two of those Policies- 30251 and CLUP Policy 4-3 concern protecting views along the ocean and that projects shall be designed to follow the natural contours of the landscape. The response is simply, "These policies have been added to Section 3.9.2 of the EIR (See Chapter 3, Errata). Looking at the Errata, there is no specific analysis explaining how the Project is compliant with the view policies. As a result, the EIR analysis is incomplete, and the Planning Commission should not have certified the EIR or approved the Project.

4. <u>THE PLANNING COMMISSION IMPROPERLY CONSIDERED THE LACK OF THE ASSOCIATION'S PROPERTY RIGHT AT THE PROJECT TO JUSTIFY DESTROYING FREEFLIGHT RECREATION AT THE PROJECT SITE.</u>

On page 3.11-3, the Draft EIR reports that glider take-off or landings are prohibited in Rincon County Beach Park and that the paragliders and hang-gliders have no "sanctioned use [of] public property." The Draft EIR cites no legal authority for this bare and demonstrably false assertion. In fact, freeflight pilots fly legally in the Bates Bluff airspace as recognized by the Federal Aviation Administration (FAA) and United States Hang Gliding & Paragliding Association (USHPA). Pilots have federal permission and legal authority to use this airspace.

A2-5

Moreover, claims that the Association has no property rights, and thus, are essentially trespassing have no place in a CEQA analysis. Numerous cases have held that it does not matter if an existing activity is legal or illegal, the mere fact that it occurs makes is a part of the environment.

(*Riverwatch v. County of San Diego* (1999) 76 Cal.App.4th 1428, 1452–1453, (baseline for a proposed quarry development was the actual condition of the land, even though some existing environmental degradation had resulted from prior illegal mining and clearing activities); *Fat v. County of Sacramento* (2002) 97 Cal.App.4th 1270, 1278–80 (baseline for airport expansion was existing airport operations, even though the airport had been operating and had expanded without a required permit for several years); *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal.App.4th 357, 370–71(baseline for proposed school playground use was the existing playground facility, even though prior construction of the facility may have violated the city's code).) Thus, an environmental review must analyze a project's impact on illegal or even "unsanctioned" existing activities, and if found to be significant, must be mitigated, if feasible. A2-5 cont'd

During the ERC Meeting, a commenter asserted that the soaring activities are "fully legal and sanctioned". (Final EIR, pdf p. 215.)

Tainting the proceedings before the Planning Commission with irrelevant characterizations of an existing use as "unsanctioned" is a false and highly prejudicial attempt to degrade the history and importance of freeflight at the Project site. This should never have been included in the Draft EIR, as it is only intended to inflame the passions of the Planning Commission and distract them from an objective environmental analysis. Unfortunately, staff do not comprehend, and the Planning Commission has not been duly advised of, the correct state of law concerning the legality of existing freeflight uses, nor of the relevance of such legality to CEQA analysis.

5. <u>THE PLANNING COMMISSION FAILED TO RECOGNIZE THAT ALTERNATIVE 4 IS THE LEAST ENVIRONMENTAL DAMAGING ALTERNATIVE, OTHER THAN THE NO PROJECT ALTERNATIVE.</u>

Recreational activities have no hierarchy in CEQA. All are equally important and must not be significantly impacted if possible. The argument that there would be more trail users than freeflight users is not sanctioned under CEQA. All recreation activities are protected under CEQA.

Alternative 4 would not destroy the existing freeflight recreation that has existed for 40 years at the ocean bluffs and the trail could be completed, thereby accommodating all recreational uses of the ocean bluffs. Every other Project alternative, except for the No Project Alternative, would destroy the freeflight recreational use of ocean bluffs. Thus, every alternative, except Alternative 4, would create a significant impact by eliminating or severely reducing the freeflight recreational use of the Project site. Accordingly, only Alternative 4 is the least environmentally damaging alternative. Moreover, Alternative 4 meets all of the Project objectives. The Planning Commission should have approved Alternative 4 to comply with CEQA. A2-6

Comment letter I6 raised the concern with the destruction of freeflight and Alternative 4 would preserve it. (Final EIR, pdf p. 96.) The response was that the comment did not raise any concern

with the adequacy of the Draft EIR. (*Id*. pdf p. 96.) Comment Letter I9 made a similar comment with a similar response in the Final EIR. (*Id*. pdf pp. 108-9.) Comment I15-3 made a similar comment with a similar response in the Final EIR (*Id*. pdf. pp. 128-29.) The same is true for Comment I20-2. (*Id*. pdf pp. 138-39.) Comment I24-2 expressly noted that Alternative Four would have the least environmental impact. (*Id*. pdf p. 147.) The response was this comment did not raise any issue concerning the adequacy of the Draft EIR. (*Id*. pdf p. 149.) These responses fail to recognize that Alternative 4 is actually the least environmentally damaging alternative.

A2-6 cont'd

6. CONCLUSION.

Due to the limited time in which to prepare this appeal, additional arguments of the Association are presented in Attachment 1. For the foregoing reasons, the Planning Commission violated CEQA in certifying the Project's Final EIR and approving the Project. Accordingly, the Association respectfully requests the City Council to approve this appeal and vacate the Planning Commission's certification of the Project's Final EIR and approval of the Project. Failure to do so will result in an appeal to the Coastal Commission.

Very truly yours,
ORBACH HUFF & HENDERSON LLP

Stan M. Barankiewicz II

Response to Appeal Letter A2

Stan M. Barankiewicz II
Orbach Huff & Henderson LLP
January 28, 2022

A2-1 The appellant is correct to state that air is included in the CEQA definition of the "environment". (Pub. Res. Code, § 21060.5; CEQA Guidelines, § 15360.) Section 3.2 of the EIR is devoted to the topic of Air Quality. With regard to Air Quality, according to Appendix G of the CEQA Guidelines, a significant impact related to air quality would occur if the Project would:

a) *Conflict with or obstruct implementation of the applicable air quality plan.*
b) *Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.*
c) *Expose sensitive receptors to substantial pollutant concentrations.*
d) *Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.*

The criteria above, however, do not include changes to air flow patterns as suggested by the appellant. With respect to attributes of the natural environment, the Project's impacts upon wind were determined based upon significance thresholds employed in the Biological Resources Section of the EIR (FEIR p. 3-37). Refer to the FEIR for the identified conclusion of less than significant impacts to avian species (FEIR p. 3-44) and Monarch butterflies (FEIR p. 3-45) associated with changes to localized airflow/wind patterns. This analysis is further supported by Professor Paolo Luzzatto-Feliz's Airflow Analysis (EIR Appendix I), which concluded that the proposed Project could result in up to a 30% reduction in wind velocities approximately 30 feet above the bluff face above an approximately 1,790 foot long portion the proposed trail. Please refer to response to comment A2-2 (immediately below), for a detailed discussion regarding CEQA requirements for the evaluation of a project's impacts on Recreation. Dennis Pagen's comment letter presents the most detailed critique of concerns about the conclusions of the Airflow Analysis. Please refer to Professor Paolo Luzzatto-Feliz's response to Denis Pagen's letter (Luzzatto-Feliz 2022) in Exhibit 2, where he refutes the concerns raised by Dennis Pagen and other members of the soaring community.

The opportunity for enthusiasts to engage in free flight in airspace above various landforms is not an environmental issue within the meaning of the CEQA Guidelines Appendix G and the definition of "environment" under CEQA and the CEQA Guidelines. (Pub. Res. Code, § 21060.5; CEQA Guidelines, § 15360; see,

e.g., *Save Our Access-San Gabriel Mountains v. Watershed Conservation Auth.* (2021) 68 Cal. App. 5th 8, 25, review denied (Dec. 15, 2021) [displacement of visitors who would use recreational areas due to reduced availability of parking is a social impact]; *Preserve Poway v. City of Poway* (2016) 245 Cal.App.4th 560, 566, 579-580 [finding an EIR did not need to analyze the social impact associated with loss of community character associated with closing a horse boarding facility].)

Relatedly, Appendix G of the CEQA Guidelines does not include alterations to opportunities for soaring (or free flight) as a potential recreation impact. (See EIR, § 3.11; Planning Commission Staff Report, pp. 14-15.) The CEQA Guidelines further do not designate "recreational activities" as part of the "environment." (Pub. Res. Code, § 21060.5; CEQA Guidelines, § 15360 [""Environment" means the physical conditions which exist within the area which will be affected by a proposed project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance…"].) As such, impacts to recreational activities that do not result in a corresponding impact to the "environment" do not constitute a significant environmental impact for the purposes of CEQA. Additionally, the Airflow Analysis demonstrates that the proposed Project would not result in reductions over 30% in the velocity of vertical or horizontal wind speeds at low altitudes over the bluff area. Lastly, the author of the Airflow Analysis refutes the criticism of the study as presented by Dennis Pagen. (See Exhibit 2.)

A2-2 Dudek commissioned an objective, site specific analysis of the alterations to airflow patterns that would result from the Project, and the effects of those changes on soaring opportunities above the Project alignment. Professor Luzzatto-Fegiz has considerable experience with fluid dynamics modeling, including airflow. (See City Council staff report Attachment C, Exhibit 3; EIR, Appendix I, and Exhibit 2) Professor Luzzatto-Fegiz's research for this particular study included a number of research papers and books addressing airflow and wind patterns for soaring opportunities. Professor Luzzatto-Fegiz reviewed Mr. Dennis Pagen's comment letter and has prepared a detailed response refuting the concerns raised by Mr. Pagen. (See Exhibit 2.)

As a dedicated commercial facility offering both launch space and soaring lessons, Torrey Pines Gliderport ("TPG") has well-documented and substantiated data regarding the range of horizontal wind conditions that generally support launching of tandem and solo gliders. This range of wind speeds was one data point, among others in the Airflow Analysis, in determining if the magnitude of potential horizontal wind speed reductions resulting from proposed slope modification associated with the Project could significantly impair conditions favorable to launching hang gliders and paragliders in the vicinity of the Project

alignment. Relying on this data point and the other cited references, the Airflow Analysis concluded that the proposed Project could result in up to a 30% reduction in wind velocities approximately 30 feet above the bluff face above an approximately 1,790 foot long portion the proposed trail. (EIR, Appendix I.)

The appeal letter also fails to acknowledge that Mr. Pagen generally acknowledges that he "examined the various graphs and equations [in the Airflow Analysis] and find them to be reasonable and accurate, except for a few caveats…" which he lists. (See Appendix B to Appeal Letter A2, p. 1, below.) Further, the appeal letter states that on a sunny day, with wind perpendicular to the bluffs, the anticipated maximum 30% reduction in wind speeds "may not result in a significant impact for launching a paraglider," with which we agree. Thus, the evidence provided with this comment and the Airflow Analysis supports that the potential changes to airflow resulting from the Project would not eliminate soaring opportunities above the Project.

It is the responsibility of the lead agency to weigh the evidence, and it may accept one expert opinion over another, so long as the decision is supported by substantial evidence. (*Citizens for Responsible Equitable Envt'l Dev. v City of Chula Vista* (2011) 197 Cal.App.4th 327, 335; see also Pub. Res. Code § 21080(e); 14 CCR §§ 15064(f)(6) & 15384.) As indicated above, the appellant's cited expert found the Airflow Analysis "to be reasonable and accurate, except for a few caveats" such that the experts agree that the project is unlikely to eliminate free flight, but they may disagree regarding the extent of reduction in airflow velocities. (See Appendix B to Appeal Letter A2, p. 1, below.) The Planning Commission, and City Council on appeal, thus could properly conclude, based on the Airflow Analysis and evidence, that the EIR found that this reduction in wind speeds would not result in a significant impact to either free flight opportunities or to the environment, as defined by CEQA.

Please see response to comment no. A2-3 regarding thresholds of significance.

A2-3 The appeal letter's assertion that the Planning Commission was required to establish a threshold of significance for impacts to wind is misplaced. The CEQA Guidelines encourage, but do not require, a public agency to develop and publish thresholds of significance for general use, through a public process, supported by substantial evidence. (CEQA Guidelines, § 15064.7(b).) A threshold of significance "*may* assist lead agencies in determining whether a project may cause a significant impact" on a case-by-case basis. (CEQA Guidelines, § 15064(b)(2) [emphasis added]; see *Oakland Heritage All. v. City of Oakland* (2011) 195 Cal.App.4th 884, 896 [stating the CEQA Guidelines do "not require a public agency to adopt significance thresholds and it does not forbid an agency to rely on standards developed for a particular project"].) The City also is not

aware of any agency that has adopted a specific threshold of significant for wind impacts affecting free flight or other recreational activities.

The Planning Commission thus was not required to establish a threshold of significance when it made its determination that, based on the available scientific and factual data, the Project would not have a significant impact on the environment. Rather, as discussed further above in response to comment no. A2-1 and below, the Planning Commission evaluated the EIR's evidence, in light of the whole record, to assess whether the proposed Project may have a significant effect on the environment consistent with Appendix G of the CEQA Guidelines. (CEQA Guidelines, § 15064.) The City Council similarly may conclude that the Project does not result in a specific adverse impact to the environment, as defined by CEQA.

Further, CEQA does not define the "environment" to include recreational resources or activities. (Pub. Res. Code, § 21060.5; CEQA Guidelines, § 15360 [""Environment" means the physical conditions which exist within the area which will be affected by a proposed project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance…"].); see also CEQA Guidelines, § 15064(e).) Rather Appendix G of the CEQA Guidelines asks agencies to consider how a project's impact on recreation may create corresponding impacts on the physical environment. (See *Save Our Access-San Gabriel Mountains v. Watershed Conservation Auth.* (2021) 68 Cal. App. 5th 8, 24-26, review denied (Dec. 15, 2021) ["Under CEQA, a project's social impacts need not be treated as significant impacts on the environment. An EIR need only address the secondary physical impacts that could be triggered by a social impact." (citations omitted)].)

For example, in *Save Our Access-San Gabriel Mountains v. Watershed Conservation Authority*, the court upheld an EIR for an improvement project in the Angeles National Forest that would remove parking spaces, which the petitioners argued would displace visitors who would otherwise use the area for recreation, because the availability of parking spaces is a social impact, not a significant impact on the environment. (*Id*. at 24-26.) Similarly, the proposed Project's potential 30% reduction in wind velocities approximately 30 feet above the bluff face may reduce the ability for free flight under certain conditions, displacement of these recreational users alone does not constitute a significant impact on the environment.

Notwithstanding the above, the EIR evaluates potential impacts to recreation according to Appendix G of the CEQA Guidelines, which state a significant impact related to recreation may occur if the Project would:

a) *Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.*
b) *Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.*
c) *Result in cumulatively considerable recreation impacts.*

Under a) the trail proposal would not "increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur." The trail itself is a new facility, which would facilitate non-vehicular access for pedestrians and cyclists to/from Carpinteria Bluffs Preserve and Rincon Beach County Park. Further, the airspace above the trail alignment is not characterized by the City or County as a "recreational facility." Even assuming that the airspace constitutes a recreational facility, based on the Airflow Analysis, the estimated 30% reduction in wind velocities approximately 30 feet above the 1,790 foot long portion of the bluff face would not significantly impact the environment and the trail would not significantly reduce opportunities for free flight or increase use of the airspace such that it would result in a substantial deterioration of a "facility."

Under b) the criteria requires examination of new recreational facilities, and their adverse physical effects on the *environment.* This question similarly focuses on the new recreational facilities' physical effect on the environment, not the social impacts on recreation opportunities. (See *Save Our Access-San Gabriel Mountains v. Watershed Conservation Auth.* (2021) 68 Cal. App. 5th 8, 25, review denied (Dec. 15, 2021).) The Airflow Analysis provides an evaluation of the changes to localized air flow patterns (horizontal and vertical wind speeds), which biologists then used to determine that impacts to avian species and insects most dependent on such wind patterns would be insignificant. (See EIR, §§ 3.3, 3.11, Appendix I.) Moreover, the EIR thoroughly evaluates the proposed Project's impacts on each of the resource areas of the environment itemized in CEQA Guidelines Appendix G and determines that, based on substantial evidence, all Project impacts upon the environment could be mitigated to less than significant levels.

Under c) opportunities for cycling, walking, and enjoying views of the ocean (all recreational activities), would be enhanced under the Project. The Project also excludes housing or long-term employment opportunities that would increase local population that could contribute to cumulative impacts on the use and degradation of parks and recreation facilities.

The three criteria from the current Appendix G of the CEQA Guidelines under Recreation (listed above) were employed as the significance thresholds for project impacts upon recreation. The Project's impacts upon wind were determined based upon significance thresholds employed in the Biological Resources Section of the EIR (FEIR, p. 3-37). Please refer to the FEIR for the identified conclusion of less than significant impacts to avian species (FEIR, p. 3-44) and Monarch butterflies (FEIR, p. 3-45) associated with changes to localized airflow/wind patterns.

Further, revisions were made to the proposed Project design (and Alternative 3), following comments received during the Draft EIR public review period, to further reduce earthwork quantities and reduce impacts on air flow by eliminating the previously shown upper elevation bench above the proposed trail bench. This design revision was found by Professor Luzzatto-Fegiz to minimize any added turbulence to the air flow conditions above the project site. (See "Comment #3 in Professor Luzzatto-Fegiz's response letter (Exhibit 2) for additional information.)

A2-4 The Project area is a highly modified transportation corridor and recreational area that has been subject to significant landform modification over the past 100+ years to accommodate past and current alignments of railroads and highways through the Project area. The existing slopes upon which the proposed trail alignment would traverse are man-made slopes themselves, and are presently (in some areas) interrupted by existing man-made benches cut into the slope faces. In this sense, modifying the existing man-made slope faces, without affecting the overall height of the slope features themselves, and introducing new bench features on the slope faces would not constitute a significant aesthetic impact in and of itself. (See EIR, Section 3.1.) See response to comment no. A2-40 for additional information on past transportation projects involving landform modification in the Project area.

Requiring review by the City ARB and County BAR is standard and acceptable mitigation to address potentially significant aesthetic impacts. (CMC § 2.36.100; County Coastal Land Use Plan, Policy 4-1; see also EIR Section 3.1.2.3.) The City ARB and County BAR are charged with reviewing the aesthetics and design of projects, and have the authority to recommend revisions to design details, as needed, to enhance aesthetics. Designing new man made features such as trail fencing, bridge color and railing details, and lighting (if any) would help to ensure that these features reflect quality design and are appropriate to the character of the existing setting.

The approval of the Project design by the City ARB and County BAR is important to ensure the physical elements of the Project, including fencing, the UPRR Bridge, and pavement treatments are consistent throughout the Project,

regardless of jurisdiction. The scale of these improvements will, however, remain subordinate to the overall scale of the Project and visibility of the resulting graded areas. In regard to grading, the slopes to be modified have not formed naturally, but instead resulted from former transportation project grading. These slopes are currently very regular, consisting of inclined planes, rather than the undulating landforms produced by natural erosion processes; relatively sparse vegetation has established over time within these steeply graded slopes. The new slopes would have a similar overall appearance at distance to the existing slopes but would at first be lacking any vegetation. One of the more important aspects of ensuring the Project's visual impacts would be mitigated is the planting of the slope areas to more closely re-create the visual character of the most visible elements within the Project alignment. While presented as a biological resources mitigation measure, MM-BIO-5 would also mitigate impacts to the existing visual resources of the Project alignment.

Comment I-32-3 (see Final EIR, pp. 180) stating that "[t]he proposed removal of 92,526 cubic yards of the existing Little Diamondhead Bluff, will be an elimination of a regional coastal resource" is neither a comment on the adequacy of the EIR nor an accurate description of the Project proposal. Although grading for the entire trail, from the eastern terminus of Carpinteria Avenue to the Rincon Beach County Park, would involve 92,526 cubic yards; this total volume was not proposed to be taken out of "Little Diamondhead" formation alone. Only the western nose of "Little Diamondhead" would be reshaped, leaving most of the "Little Diamondhead" feature intact. The appellant also fails to clearly note which section of the EIR is allegedly inadequate with respect to the regrading, but not removal, of the "Little Diamondhead" feature.

With regard to the Project following the natural contours of the landscape (Coastal Act Policy 30251 and CLUP Policy 4-3), the EIR explains that the entire Project alignment is located on topography that has been regraded from earlier transportation projects including the Southern Pacific rail line and State Highway 2. The overly steep slopes in this area are not natural and are prone to excessive erosion. The Project would regrade this artificial slope angle to be somewhat less steep, resulting in a very similar appearance to the present conditions, but resulting in greater long-term stability and encouraging the establishment of more vegetative ground cover. For the purposes of CEQA, local agencies have the discretion to determine whether a proposed Project is "compatible with the objectives, policies, general land uses, and programs specified in the applicable plan." (*Joshua Tree Downtown Business Alliance v. County of San Bernardino*, (2016) 1 Cal.App.5th 677, 694-697.) A project is only found to be inconsistent with a policy when it is "clearly" inconsistent with a "fundamental, mandatory and specific" policy. (*Id*. at 697.) As a result, the Planning Commission could find that the EIR contains substantial evidence to support that the proposed Project with

mitigation does not constitute a significant adverse impact on aesthetics and is consistent with applicable policies.

A2-5 Consistent with CEQA, the Recreation Section of the EIR describes the environmental setting and existing conditions of the Project, including the history of soaring over the Project alignment as well as other unsanctioned pedestrian trails and crossing of the Union Pacific Railroad ("UPRR") tracks. (EIR, § 3.11.1; CEQA Guidelines, §15125.) Both soaring activities and pedestrian trails were incorporated into the environmental setting and baseline for the analysis of significant impacts to the environment consistent with the cases cited in the appeal letter. As such, the EIR does evaluate the Project's potential significant environmental impacts on the environment relative to the existing baseline conditions, including soaring activities.

The appeal letter also states that the Federal Aviation Administration ("FAA") recognizes the "Bates Bluff airspace" and cites to a commenter's statement that soaring activities are "fully legal and sanctioned." (FEIR, p. 215.) CEQA requires findings to be supported by substantial evidence. (CEQA Guidelines, §§ 15064(f)(5), 15204(c), 15384.) Substantial evidence includes "facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts." (CEQA Guidelines, § 15384(b).) Substantial evidence is not "argument, speculation [or] unsubstantiated opinion or narrative…" (CEQA Guidelines, § 15384(a); see *Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 583.) The appeal letter and commenter do not support these assertions with substantial evidence that soaring activities are legal and sanctioned in this area.

The EIR further evaluates the proposed Project for inconsistencies with federal, state and local law, regulations, plans and policies. (See CEQA Guidelines, § 15125(d).) These policies include Federal Aviation Regulation ("FAR") Part 103, Federal Aviation Regulation, Ultralight Vehicles, which generally apply to soaring activities in "ultralight vehicles" such as paragliders and hang gliders. Section 103.15 of the FAA Regulations states that "[n]o person may operate an ultralight vehicle over any *congested area* of a city, town, or settlement, or over any open air assembly of persons." (14 C.F.R. § 103.15 [emphasis added].) In addition, FAA administrative materials state that FAA Regulation Section 91.119(b) applies to operation of ultralight vehicles and "prohibits operating an aircraft over any congested area below an altitude of 1,000 feet above the highest obstacle within a horizontal radius of 2,000 feet of the aircraft." (*In the Matter of: David C. Siddall*, 2008 WL 4948486, *3; 14 C.F.R. § 91.119(b).) The City is not aware of whether the appropriate FAA official has issued a case specific determination authorizing the use of the airspace above the trail alignment for ultralight vehicles, including hang gliders and paragliders, based on applicable FAA regulations.

The Assistant Director of the Santa Barbara County Community Services District also submitted a letter (see City Council staff report Attachment J) stating that County Code section 26-22 applies to the Rincon Beach County Park. County Code section 26-22, Landing Aircraft, also specifically states:

> *No person shall land, launch or operate any aircraft, including, without limitation, any balloon designed to carry passengers, airplane, hang glider, ultralight airplane, glider, drone or flying apparatus on or within any county recreation area except in case of emergency or with the prior written permission of the director of community services or deputy.* (emphasis added.)

The appellant and commenter have not provided evidence that they or other have obtained prior written permission from the County director of community service or deputy to operate an aircraft within Rincon Beach County Park.

Additionally, as part of the City's research for the appeal and a request to investigate the viability of a "flight park" by a member of the Soaring Community, the City contacted Mr. John King, the managing member of the Rincon Bluffs Group, LLC, and owner of the property near the east end of Bluffs III where free flight pilots typically launch to access the airspace above the trail alignment. Mr. King indicated that he recently recorded a "Notice of Consent to Use Land," which allows for members of the public to use the property as a scenic look out and/or paragliding launch site, subject to the owner's approval. (See City Council staff report Attachment I.) City staff also contacted UPRR, who confirmed that no such permission to use UPRR property for launching or landing of aircraft has been or would be granted, and requested the City submit information sufficient for UPRR to consider pursuing a cease and desist order.

Thus, the appellants have not provided substantial evidence that refutes the information presented in the EIR and from the County Code that soaring activities above a portion of the Project alignment are expressly authorized by the FAA and County. (CEQA Guidelines, § 15384; see *Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 583.) Notwithstanding the above, the EIR adequately considers existing free flight activities and evaluates how the Project may have a significant adverse impact on the environment based on this baseline.

A2-6 Neither the analysis provided in the EIR, nor the public comments submitted to date, have demonstrated that the proposed Project or Alternative 3 would destroy free flight in the area. Notwithstanding that recreational activities are not part of the "environment" for the purposes of CEQA, the City's consultant commissioned an independent Airflow Analysis to evaluate the potential impacts on the

opportunity for free flight. (See Pub. Res. Code, § 21060.5; CEQA Guidelines, § 15360 [defining "environment"]; see also *City of Pasadena v. State of California* (1993) 14 Cal.App.4th 810, 829, ["CEQA does not address the purely social effects of a project."]; *Preserve Poway v. City of Poway* (2016) 245 Cal.App.4th 560, 566, 579-580 [finding an EIR did not need to analyze the social impact associated with loss of community character associated with closing a horse boarding facility]; *Save Our Access-San Gabriel Mountains v. Watershed Conservation Auth.* (2021) 68 Cal. App. 5th 8, 24-26, review denied (Dec. 15, 2021) [displacement of visitors who would use recreational areas due to reduced availability of parking is a social impact]; CEQA Guidelines, § 15064(e) ["Evidence of economic and social impacts that do not contribute to or are caused by physical changes in the environment is no substantial evidence that the project may have a significant effect on the environment."].) This Airflow Analysis relied upon in the EIR concluded, based on a variety of cited sources, there could be up to a 30% reduction in favorable wind conditions 30 feet above the bluff face across an approximately 1,790 foot portion of the trail alignment and that such reduction was a less than significant impact to soaring activities.

Despite the contrary statement in the appeal, Alternative 4 would not meet all stated Project objectives. Specifically, Alternative 4 would not best meet the intent of Objectives 5 and 7, to create a multi-use path that improves coastal access and recreation opportunities by completing a critical missing link in the CA Coastal Trail in a manner that is consistent with the goals of Senate Bill 908 (2001). Alternative 4 would also fail to do anything to stabilize the eroding coastal bluffs on the south side of the UPRR crossing (Objective 4).

With respect to the potentially significant impacts identified in the EIR, the appellants' allegation that Alternative 4 is the least environmentally damaging alternative is not supported by the record. With regard to the analysis of recreation impacts, refer to response to comment no. A2-3 (above). Alternative 4 would increase the volume of earthwork, as compared to the proposed Project or Alternative 3. (See EIR Section 6; EIR p. 6-20.) Because of the increased earthwork, impacts on air quality & greenhouse gasses, energy, geology, noise, hydrology and transportation would also likely increase under Alternative 4. While reductions in vertical and horizontal airflow over the bluffs would be avoided with Alternative 4, no significant impacts have been identified in relation to air flow reductions resulting from the Project or Alternative 3. Consequently, Alternative 4 is not the least environmentally damaging alternative; Alternative 3 (with the slightly narrower pathway southeast of the UPRR alignment) is the environmentally superior alternative.

Lastly, this comment references certain comments in the record to support the above assertions and suggests that the EIR provides incomplete responses to

multiple commenters regarding the ability of Alternative 4 to avoid impacts of the Project related to the loss of soaring opportunities from wind flow reductions. It is common practice in preparing responses to comments as part of an EIR to refer the reader back to previous comments that address the issue raised and/or provide a general response. (See CEQA Guideline, §§ 15088(c), 15204(a).)

Appeal Letter A2

Santa Barbara Soaring Association
P.O. Box 30485
Santa Barbara, CA 93130

January 28, 2022

City of Carpinteria, City Council
5775 Carpinteria Avenue
Carpinteria, CA 93013

RE: Formal Appeal of Planning Commission Decision, Rincon Trail Project

To the Carpinteria City Council Members,

The Santa Barbara Soaring Association (SBSA) and other interested parties, are appealing the City of Carpinteria's Planning Commission's decision on January 18, 2022 to certify the Focused Environmental Impact Report (EIR) of December 2021 by Dudek, and the granting of a Conditional Use Permit and a Coastal Development Permit for the proposed Multi Use Trail (M.U.T.), Rincon Trail Project 19-2015-CUP/CDP. Listed below are the reasons for the appeal to you, the Carpinteria City Council. Please advise on hearing dates to discuss further.

1. California Environmental Quality Act (CEQA) of 1970, requires an evaluation of how the project will impact existing recreation. The law regards all forms of established recreation to be worthy of impact analysis and subsequent mitigation. There is no qualification within CEQA concerning the type of recreation, method of access, or future condition. The EIR fails to comply with CEQA by discrediting and dismissing a group of recreational users who have been operating at this site for 40 years. Rather than conducting reasonable review of project impacts and measures for mitigation, the EIR is designed to overlook and exclude. This issue was highlighted by the Environmental Review Committee (ERC) in their April 13, 2021 review of the EIR, where they stated that impacts to flying were not adequately addressed and that other alternatives should be explored. The SBSA also submitted a letter with line by line analysis of inaccurate information about free flight prevalent in the Subsequent MND. This letter was sent to you, Carpinteria City Council, on August 2, 2020 and to Nick Bobroff, Project Manager, on November 30, 2020 during the EIR scoping. Regardless, this language continues to plague the EIR. An Appendix has been provided with a list of these actionable mistruths.

A2-7

Attachment 1

2. The Responses to Comments section in the EIR states that the airflow analysis report (*Airflow Analysis for the Proposed Regrading of the Rincon Bluffs*, Paolo Luzzatto-Feliz, PhD, January 22, 2021) is evidence of no significant impact to recreational soaring. However, the premise upon which this conclusion is based is patently false. To confront the issues inherent in this study, we realized an expert in the eyes of the City would need to provide testimony. We had already witnessed the Planning Commission summarily dismiss the expert testimony of dozens of pilots with hundreds of soaring hours at this particular site (Subsequent MND hearing). We decided to contact Dennis Pagen, who is quoted in the airflow analysis report itself and whose research is used by the authors. This is not a case of competing experts, but rather the same expert, trusted by the City to provide “evidence”, that is being asked to further evaluate and clarify the airflow models and their application. What Dennis points out is that the airflow analysis report is not an accurate or sufficient model because it ignores the depth and length of the ridge, the wind gradient, creation of turbulent rotor zones and venturis, and changes in thermal patterns. He concludes that the data used in the airflow analysis fails to represent the bigger picture and real-world conditions, and that it is predominantly based on sailplanes, which are rigid gliders with a wingspan up to 100ft that operate entirely differently from paragliders and hang gliders. If the EIR is declaring no significant impact to soaring recreation, a more accurate model is required to make this case. Please see Dennis Pagen’s full letter in Appendix B.

A2-8

3. CEQA requires all forms of recreation to be valued equally. The proposed M.U.T. runs counter to this criteria. The M.U.T. expands access primarily to bicyclists at the exclusion of paragliders and hang gliders. While bicyclists have access to many miles of recreational paths, the construction of this 0.2 mile section of the M.U.T. will effectively end most soaring opportunities in Carpinteria, significantly impacting the recreational use of countless pilots. This site is the one place in Carpinteria where coastal soaring pilots can pursue their passion and practice their craft, sharing the joy of free flight with residents and tourists alike. The EIR is not compliant with CEQA if it replaces established recreation of pilots with other users such as bikers. Likewise, the Planning Commission’s certification of the EIR simply to serve a greater number of estimated future users is not supported by CEQA. It prioritizes one group of users over another.

A2-9

4. The scope of the EIR failed to evaluate alternatives, to avoid massive earthwork at this site. The Certified Santa Barbara County Coastal Land Use Plan asserts that "...recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment...shall have priority over uses requiring substantial alteration". According to this guidance, paragliding and hang gliding activities in Carpinteria should have priority over the current M.U.T. proposal to displace 96,040 CY and remove 85,521 CY of material because our recreational activities do not require alteration to the existing environment. The proposed project design is significantly damaging to the coastline (four proposed outflow drains to the beach), infringing on the Coastal Act, while excluding current recreational users. Alternatives that avoid cutting

A2-10

into Little Diamondhead ridge, realignment of the “Dogleg,” of the bridge (inline with the southbound US 101) should be considered, and formally analyzed.

A2-10 cont'd

5. The selected Alternative #3 is focused on providing a “blue ocean view” rather than a safe, useful, esthetically pleasing, less costly and less environmentally intrusive, more sustainable alternative. There is no plan for maintaining this bike path after it's constructed on a 100 year old eroding seawall, where a railroad and highway easement have failed and been abandoned. There is also no plan for managing traffic in the already congested and incredibly steep Rincon Beach parking lot where the bike path terminates. This design needs to be reassessed from the perspective of the very groups it's trying to help. It was cited in the bicyclist survey conducted by Ottis Gillespie (MUT Bicyclist survey pg 186 Dec 2021 EIR), that bicyclists preferred to have the proposed M.U.T. on the Southbound US 101 freeway side of Little Diamondhead. The City has not provided any detailed input from bicyclists, who are the most likely end users.

A2-11

6. The California Department of Conservation has determined that there is an oil well within the proposed M.U.T. alignment that was not abandoned or capped properly for gas or water intrusion (p.140-144, EIR). The property owner becomes the responsible party for this oil well. It must be abandoned properly and remain accessible. Under the current design in Alternative #3, the M.U.T. will be constructed over the oil well. The California Department of Conservation may return at a later date to excavate down to the well to access it. This has a significant impact in cost, liability, noise, and construction. There is no such issue with the oil well when building the M.U.T. in accordance with Alternative #4, making it a better environmental option. Concerned citizens mentioned the presence of the oil well to the Planning Commission. Its potential short and long term impacts were not adequately addressed in the time available. An additional hearing and corrected EIR is needed.

A2-12

7. The conceptual plans presented to decision-making authorities and to the public have differed between the Planning Commission meeting on January18, 2022 and the SBCAG meeting on January 20, 2022. While the Planning Commission reviewed EIR Alternative #3 with a straight cut into the ridge, the SBCAG presentation focused on a path with an ‘elbow’ bend toward the ocean. The significant differences between these conceptual plans is misleading and confusing. This lack of clarity is exacerbated by the ommission of engineer estimates and analysis for the EIR Alternatives, and the lack of line items describing details of the trail construction and materials. An appeal is needed to determine what aspects of the conceptual design are being proposed to the public and illuminate the key details such as trail alignment, and provide estimates for more accurate comparison of Alternatives.

A2-13

A2-7 Please refer to response to comment no. A2-3, above, for a more in depth response.

A2-8 Mr. Dennis Pagen's comment letter prefaces the detailed comments section with, "[t]o begin, I have examined the various graphs and equations and find them to be reasonable and accurate, except for a few caveats which I shall list and address below…" Mr. Pagen does not dismiss the entire analysis as inadequate or inaccurate, and in fact provides critique of only four aspects of the Airflow Analysis (Luzzatto-Feliz, 2021). While Mr. Pagen asserts the study methodology should be adjusted to more accurately predict a change to the wind flow patterns from the Project, he does not provide substantial evidence, such as suggested numeric adjustments to accompany model parameters of which he is critical. (CEQA Guidelines, § 15384.) Professor Paolo Luzzatto-Feliz has prepared a response letter to Mr. Pagen's comment letter, in which he refutes the arguments presented by Mr. Pagen; the reader is referred to Professor Luzzatto-Feliz's response for detailed information (refer to Exhibit 2, Luzzatto-Feliz 2022).

A2-9 The appellant does not cite to any evidence to support the assertion that "CEQA requires all forms of recreation to be valued equally."

As discussed above in response to comment no. A2-3, the EIR evaluates the proposed Project based on Appendix G of the CEQA Guidelines. There is no language in the checklist that compels the examination of one form of recreation relative to another recreational resource.

In considering the merits of a project, however, a lead agency can evaluate the advantages and drawbacks associated with the proposed project design and corresponding alternatives. (See *Laurel Heights Improvement Assn. v. Regents of Univ. of California*, 47 Cal. 3d 376, 392, 764 P.2d 278, 283 (1988), as modified on denial of reh'g (Jan. 26, 1989) ["The EIR process protects not only the environment but also informed self-government."].) The CEQA Guidelines state it is an implicit policy in CEQA "that decisions be informed and balanced" and that "[i]t must not be subverted into an instrument for … delay of social, economic, or recreational development or advancement. (CEQA Guidelines, § 15003(j) [citations omitted].) As such, the EIR evaluates and describes various considerations associated with the proposed Project.

Currently, pedestrians and some cyclists use informal pathways from the east end of Carpinteria Avenue, and across the UPRR, in order to reach Rincon Beach County Park without using a motor vehicle. It is currently unsafe for pedestrians and cyclists to use these routes; the proposed Project would not only provide walking and cycling opportunities for residents and visitors but it would also create a safe, physical link between the Carpinteria Bluffs Preserve and Rincon Beach County Park for cyclist and pedestrian travelers. The proposed Project also has great recreational value in closing a gap in the local segment of the California Coastal Trail system. All of these recreation benefits would derive from the Project, even if the Project may result in a potential reduction in the frequency of days where airflow velocities could provide ideal free flight opportunities above the Project.

Moreover, as discussed above in the response to comments nos. A2-1 through A2-3, in the EIR and Airflow Analysis, the topographic modifications associated with the Project would not be anticipated to eliminate soaring opportunities above the Project alignment.

A2-10 The purpose in an EIR of examining alternatives to the proposed project is primarily to determine if the major objectives of the project could be achieved in a manner that reduces potential impacts on the environment, compared to the proposed project. (CEQA Guidelines, § 15126.6.) Because of the concerns regarding earthwork volumes raised by the County and California Coastal Commission, the examination of alternatives to the Project focused on means of reducing earthwork volumes, while still providing a trail that closes the existing local gap in the California Coastal Trail System. (See Attachment C, Exhibit 1 Proposed Final EIR, Section 6, and Attachment C, Exhibit 2 Draft EIR, Section 6). A total of 4 alternatives were examined, and it was found that earthwork volumes could not be reduced to a substantial degree under any of the alternatives. Examining other alternatives is beyond the requirements of CEQA, which stipulates the range of alternatives examined need not be exhaustive. (CEQA Guidelines, § 15126.6(a) & (d); *City of Maywood v. Los Angeles Unified Sch. Dist.* (2012) 208 Cal.App.4th 362, 414; *South of Market Community Action Network v. City & County of San Francisco* (2019) 33 Cal.App.5th 321, 345.) With respect to the excerpted passage from the County Coastal Land Use Plan, "… recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment… shall have priority," the Project alignment consists of heavily modified terrain remnant from former transportation facilities. The slopes and benches the Project seeks to grade to accommodate the trail are not natural in form and would be re-graded to increase long-term stability. Please refer to the previous response to comment no. A1-3, above, for further discussion of alternatives.

Further, the portions of the proposed trail alignment located in the County's jurisdiction are designated for transportation and recreation uses. A public multi-use pathway is consistent with the types of land uses anticipated in both land use designations/zoning districts. Locating a multi-use trail in the area, connecting Carpinteria to Rincon Beach County Park, has been designated as a high priority regional alternative transportation project, is identified as a planned capital project in the City's General Plan/Coastal Plan, and has been made a required condition of approval of the Linden Avenue and Casitas Pass Interchanges and Via Real Extension Project (No. 09-1522-CUP/CDP).

The Project has been designed in an effort to minimize environmental impacts, including but not limited to landform modification and earthwork quantities while still achieving the stated Project objectives and fulfilling the intent of the various policy and regulatory mechanisms triggering this Project. The physical and environmental constraints of the Project area are such that providing a multi-use trail through the Project area that does not result in any alterations of the area would be infeasible.

Lastly, despite the "historic" use of the area by free-flight enthusiasts, County Code section 26-22, Landing Aircraft, specifically prohibits the landing, launching or operation of any aircraft, including, without limitation, any balloon designed to carry passengers, airplane, hang glider, ultralight airplane, glider, drone or flying apparatus on or within any county recreation area except in case of emergency or with the prior written permission of the director of community services or deputy. The Assistant Director of the County Community Services Department submitted a letter confirming that this section applies to the Rincon Beach County Park. (see City Council staff report Attachment J.) The City is not aware that the County has provided permission for free flight above or within the Rincon Beach County Park. Please refer to the previous response to comment no. A1-5, above, for further discussion.

A2-11 The proposed trail is not intended to solely serve cyclists or provide a direct connection to the continuation of the Pacific Coast Bikeway, which commences at Bates Road and continues southbound along the U.S. Highway 101 shoulder. Rather, the proposed trail is intended to be a multi-use pathway that can serve a variety of different trail users with different objectives, including but not limited to pedestrians, beachgoers, park visitors and cyclists. Further, part of the intent for designing a coastal trail is to offer a safe, legal, convenient and attractive alternative to the present use by the public of informal trails that trespass through UPRR property to connect Carpinteria to Rincon Beach, or that travel along the unprotected shoulder of U.S. Highway 101.

A trail that runs along the U.S. Highway 101 shoulder from SR 150 to Bates Road may benefit cyclists wishing to continue their ride on the Pacific Coast Bikeway, but it would not materially improve access to Rincon Beach County Park or its vertical coastal access points. In such a scenario, beachgoers (whether as pedestrians or cyclists) would instead still be faced with climbing the hill through the Rincon Beach County Park parking lot to reach the coastal access points in the park, and would then have to descend the same hill to exit the park and return to the trail back to Carpinteria. Also, there is a greater likelihood that pedestrians and cyclists wishing to visit Rincon Beach County Park would continue to opt for the more direct informal trespass trails across the UPRR corridor to connect Carpinteria to the County Park.

The termination of the proposed trail at the western terminus of the Rincon Beach County Park parking lot was reviewed and evaluated by the City's consulting traffic engineer. (See Exhibit 3, memorandum from TKM Engineering, dated February 17, 2022; see also City Council staff report Attachment C, Exhibit 3- EIR, Appendix J.). In the memo, Mr. Mericle noted that routing bicycle paths into parking areas is a common practice in the coastal Santa Barbara and Ventura area, and has not been found to pose a safety hazard. Rather, the introduction of additional pedestrians and cyclists into an already slow speed mixed traffic area is likely to further encourage drivers to exercise greater caution in traveling through the parking lot. The parking lot drive aisle width near the trail entrance/exit provides more than the standard width needed for this parking/drive aisle arrangement, which provides additional opportunity for maneuverability to reduce negative interaction between vehicles, cyclists and/or pedestrians. The eastern end of the proposed trail approaching Rincon Beach County Park is generally flat, such that cyclists and other trail users approaching the parking lot would not significantly change their speed. The western portion of the parking lot is similarly relatively flat. By the time cyclists reach the steeper downhill section towards the eastern end of the parking lot, the cyclists are already integrated into the slow speed mixed traffic environment of the parking lot.

A2-12 Please refer to the previous response to comment no. A1-5, above, in the Karl Cameron appeal letter and Exhibit 1.

A2-13 Please refer to the previous response to comment no. A1-2 in the Karl Cameron appeal letter.

Appendix A:
Corrections to the Final EIR of December 2021

Inaccuracy #1: free flight at Bates is an unsanctioned activity

a. We legally fly in this airspace as a recognized group by the Federal Aviation Administration (FAA) and United States Hang Gliding & Paragliding Association (USHPA). We have federal permission and legal authority to use this airspace. A2-14

b. Paragliding and Hang Gliding have been happening regularly at the Bates bluff for over 40 years and is fully established in this location. It is the only coastal soaring site in Carpinteria and the best known site, with consistent prevailing wind soaring between San Diego and San Francisco. Unique geographic features combine Southwest facing terrain with channel winds, allowing horizontal (laminar) airflow to be deflected upward at the bluff face of Little Diamondhead ridge. This is similar to the ocean swells that come into Rincon Point for surfing. A2-15

c. Little Diamondhead is special in allowing (in certain conditions) cross country flight. The Project site generates lift that allows pilots to transition to the surrounding bluffs and travel dozens of miles along the coastline, also making extended flights, slightly above the bluff face possible. A2-16

d. Exhibit 2 lists official rules governing free flight while also claiming it's an unrecognized and unsanctioned recreational activity. This is an obvious contradiction resulting from the City's selective use of the term "unsanctioned" to fit their needs. How do activities become publicly recognized? Are bikers or surfers sanctioned? No guidelines or examples are provided to address a shared location like Bates. A2-17

e. Exhibit 2 states there are safety hazards regarding the freeway and UPRR, yet no evidence is provided. Meanwhile, the EIR has no mitigation plan for the significant impact of bike traffic in Rincon Park caused by the Project. This congested area is already the site of numerous collisions (some cited by Council and Commission Members and public comments) that regularly occur between bicyclists vs. vehicles, vehicles vs. bicyclists, vehicles vs. pedestrians, bicyclists vs. pedestrians. A2-18

f. Exhibit 2 states that flying at Bates is questionable because foot traffic across the UPRR is restricted. However, pilots are flying over this alignment, not crossing the railroad by foot. There are no airspace restrictions relevant to our activities and our recreation in this area has been supported by expert testimony of FAA members during the Subsequent MND hearing. It should be noted that significant numbers of bicyclists and hikers are crossing the UPRR near the seal Rookery, where they are funneled by existing dirt trails of the Carpinteria Trail Head Bluffs (map shown on the City's website). Where is the project to mitigate these infractions? A2-19

g. FAA officials and career airline pilots provided expert testimony during the MND and EIR hearings to confirm that no aviation rules are being violated at this site. A2-20

2. Inaccuracy #2: the preferred launch site disqualifies free flight from CEQA
   a. The Rincon Trail Project has no bearing on the current launch locations, it is outside the scope of the project and irrelevant. A2-21
   b. The ownership status of the launch location parcels is subject to change before, during, and after the project, and should not factor into the EIR. A2-22
   c. Pilots have the capacity to launch from public and private locations to begin flying activities at Little Diamondhead, at times launching from National Forest property. However, flight can only be maintained at Little Diamondhead if the existing geological features remain intact. A2-23
   d. 5On rare windy days, pilots launch from the county property portion below the bluff, which is not in the Rincon Beach County Park or any private property. A2-24
   e. The Certified Santa Barbara County Coastal Land Use Plan adopted in 1982 states "...recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment...shall have priority over uses requiring substantial alteration." According to this plan, whether the land is public or private, free flight in Carpinteria should be given priority over this M.U.T. because our recreation requires no alteration to the environment. A2-25

3. Inaccuracy #3: the Project will not have a negative impact on uplift and airflow
   a. During the Public Workshop, MND hearings, and EIR hearings, SBSA provided expert testimony and evidence from engineers and FAA officials to substantiate the M.U.T. 's negative impact on uplift and airflow. A2-26
   b. SBSA created a video "Preserve Free Flight at Bates Bluff," by Aaron Laplante, local certified pilot, describing in detail how the M.U.T. will drastically affect airflow. This video was provided to the Planning Commission and City Council and proponents of the plan, and was discussed at length during the MND hearing: https://www.youtube.com/watch?v=SVIdEfWHMpE&t= . A2-27
   c. Despite SBSA's efforts, Exhibit 2 states that the flying community has not provided evidence of negative impact. This inaccurate conclusion is made without acknowledgement of what SBSA already provided and without explanation of what more is needed. A2-28
   d. The City has not demonstrated or reasonably proved that this M.U.T. will not significantly change vertical airflow or address the concerns of all current users. There is no proof that this project will not ruin a treasured flying site that has been lovingly used for decades. A2-29
   e. Exhibit 2 claims that the M.U.T. will not have a negative impact on airflow. No expert testimony, data, or evidence is provided. It also appears that Exhibit 2 confuses our sport with parasailing, which is a separate activity involving a boat. See Dennis Pagen's letter in Appendix B which further refutes the airflow analysis report. A2-30
   f. Exhibit 2 states that the M.U.T. will improve uplift, yet no reasonable proof is provided. Wind gradient models are readily available online and SBSA is willing to further demonstrate how uplift is less productive at lower elevations and A2-31

severely disrupted by a bench (in terms of width) like the one (twenty- two feet wide which includes a grated concrete "V," ditch) proposed. Below are two online articles that speak to soaring dynamics in areas of ridge lift.
Ridge Lift Research: http://journals.sfu.ca/ts/index.php/ts/article/viewFile/608/571
Ridge Soaring: https://chessintheair.com/what-conditions-produce-good-ridge-lift/

A2-31 cont'd

g. Exhibit 2 wrongly suggests that uplift is equal across all seaside bluffs in the area. While pilots may launch from a lower bluff, rarely is there enough uplift to sustain flight. Pilots immediately transition to the Little Diamondhead ridge, which has a steep, unobstructed face that generates adequate lift in a wide range of wind conditions. The Torrey Pines Gliderport (TPG) study cited in the December 2021 EIR (11032 2.5) was inaccurately portrayed and compared to the two distinct Bluffs in Carpinteria. The approximately 300 foot tall, sheer cliff face at TPG, correctly concludes that "launching," is easier to perform in lighter horizontal, deflected upward, wind conditions. This is applicable to wing inflation and "soaring opportunities," at the one, long continuous terrain feature of TPG. Wing inflation for "launching," is similar in Carpinteria. However, with two distinct separate Bluffs, the "launching," activities occur at one Bluff, and the "soaring opportunities," occur at the Little Diamondhead Bluff due to the prevailing southwest wind (as cited in Aaron Laplante's video). Author of many books on paragliding, Dennis Pagen has also addressed this in his letter (with a submission pointing out inaccuracies of application of his studies) to the Planning Commission.

A2-32

h. The Project will cause permanent damage to a unique, treasured flying site, yet there are no assurances it will withstand rising sea levels and increased storm activity on the unstable slopes where it's being proposed. The EIR of December 2021 has not demonstrated compliance with the Carpinteria Rising Sea Policy and does not account for long term maintenance or provide a plan for preventing eventual slope failure, which has already happened for the old railroad and highway.

A2-33

i. The City has not provided substantial evidence and/or sufficient analysis of exploring any alternatives on either the north side of northbound US 101 or the north side of Little Diamondhead, which is aligned with the US 101 southbound side of the highway. These alternatives are preferred by most potential end users (see 2020 bicyclists survey administered and compiled by Ottis Gillespie on the King property) and will definitely save costs. If not for the blue view desire, the currently existing trail on the freeway could add a line of barriers (similar to the continuance of the trail, east of Bates Road) along the US101 South (which is 12 - 16 feet wide in some areas) and the same type barriers on the US 101 North (10-22 feet wide in some areas). Considering the one way nature of traffic flow this would accommodate a five foot wide path in each direction) to protect bicyclists between exits.
The "Environmentally Superior Alternative," (Alternative #4 April 13 2021 meeting) with additional comments added to correct the improper alignment of

A2-34

the bridge and the extension of the path further east towards Bates Road has not been adequately addressed or compared or considered by the proponents. A2-34 cont'd

j. The majority of questions and comments contained in the December 2021 EIR address specific inadequacies of the Draft EIR presentations and conclusions. The attempted responses to a majority of questions and comments of the December 2021 EIR, Focused EIR and the MND did not provided a reasonable response: by omission of facts, misstatement of facts, concealment and/or denial of potential, substantial environmental impacts, for the proposed M.U.T.,whether submitted by State agencies or groups or individuals. A2-35

k. Mitigation Measures AES-1 requires County Board of Architectural Review pages 226-228, 3.3.1 Existing Conditions: "The Carpinteria Bluffs are among the last remaining coastal open space areas within the County and are a prime example of undisturbed California Coastline." This will be ruined by a proposed environmentally intrusive, costly, unsightly reconfigured, reconstituted, land mass (which will obliterate the Little Diamondhead Bluff), with unsightly concrete slabs, vehicle traffic sized footprint, unsightly bridge (UPRR will require a fully encapsulated bridge), which will dump untreated stormwater runoff onto the beach, which will result in environmental damage to the beach. A2-36

l. Gary Mussel in his April 26,2021 letter (Letter 01 of the December 2021 EIR) "Draining onto the Beach." "Five (now four) new drainage pipes will…," "...may be creating gullies across the sand…" "The "...long term "gullification…" He writes about the environmental impact to the beach. "Removal of Concrete Brik-Brak," "...the concrete "brik-brak…slated to be removed as a safety hazard." The City's response, "... the concrete debris mentioned in the comment is associated with a former state highway and is not the responsibility of the project (hence, the M.U.T. proponents and lead agency, the City of Carpinteria) to remove these remnants." The city has stated that they are absolved from addressing any and all safety hazards, involving the former state highway, which encompasses the Little Diamondhead Bluff and proximal locations. Not wanting to respond to existing safety hazards is indicative of actionable neglect. A2-37

m. Planning Commissioner John Callendar's comments at the January 18, 2022 Planning Commission meeting at approximately 106 minutes of video recording of the meeting reference; impact to paragliding and hang gliding activities, at approximately 111 minutes of video recording of the meeting (VRM) reference to CEQA application of proper and accurate wind study for "soaring activities," and "significant impact," to flying activities, at approximately 119 minutes of VRM, reference to opposition of the wind study included in Draft EIR. A2-38

n. Measure "A," funds mis-allocated for a tourist attraction for potential neighboring hotels, instead of for a sustainable, direct, alternative transportation route. A2-39

o. Global Response 2 (two) clearly states that the goal is to, "...recontour manufactured slopes…, " with a remanufactured " recontoured slope." A "slope," is inclusive of the top, middle and bottom. With only approximately 160 feet in height, a fairly steep slope, a competent engineer could not make a calculation and or assessment that the significant earthwork intrusion on the middle, and A2-40

lower portion, would not compromise the top. With the scheduled removal of remnants of state highway (refer to response of Gary Mussell's April 26, 2021 letter), the city's likelihood for the Little Diamondhead Bluff to be obliterated is extremely high.

A2-40 cont'd

p. The early start (2018) of, and the completion of the foundation of the NW bridge "buttress," aka "foundation," violates all provisions for pre approval, environmental impact and required permits. The most likely reason, proponents desire the bridge to be aligned in one particular direction for Alternative #4 or #3 On page 115 of the December 2021 EIR

A2-41

q. Inadequate response to Erin Maker at April 13 2021 ERC meeting. Her questions about the proposed project costs, vs. other project alternatives did not receive a detailed response or include any actual or projected costs. On page 212 of December 2021 EIR and page 2 of 8 Carpinteria Rincon Trail ERC meeting.

A2-42

r. City's response to comment letter I-33 by Tim Barker. This response is not addressed to Mr. Barker and is an indication that the City has not taken comments about the inadequacy of the EIR seriously. Dismissive and "canned," responses are repeated throughout the "Responses to comment letter(s) " On page 190 of December 2021 EIR

A2-43

"Appendix A"
"Corrections to the Final EIR of December 2021"
Santa Barbara Soaring Association
January 28, 2022

A2-14 Please refer to response to comment no. A2-5, above.

A2-15 As discussed above in response to comment no. A2-3, the environmental setting of the Recreation Section of the EIR describes the history of soaring activities over the Project alignment; this comment and others on the Draft EIR have provided more detailed comments about the aspects of the local topography that are beneficial to wind patterns that support soaring activities. The Airflow Analysis and supplemental response in Exhibit 2 have carefully considered the existing topographic conditions and resulting wind patterns, and subsequently evaluates the changes to these air flow patterns from the proposed topographic modifications to implement the trail Project.

A2-16 "Little Diamondhead" is not proposed to be removed by the Project. The existing ridgeline throughout the Project alignment will remain largely at the current crest elevation and with slope faces oriented toward the ocean that remain steeper than 2:1. The Airflow Analysis has carefully considered the existing topographic conditions and resulting wind patterns, and subsequently evaluates the changes to these air flow patterns from the proposed topographic modifications to implement the trail Project. Please refer also to response to comment no. A2-1 through A2-3, above, for additional discussion.

A2-17 The City has used the term "unsanctioned" with respect to soaring activities above the trail alignment chiefly due to existing prohibitions to launch or land on certain public and private properties including Caltrans right-of-way, County Property (including, Rincon Beach County Park), and the UPRR right-of-way. While private property owners in the vicinity of the bluffs supporting soaring may allow take-off or landing that supports soaring over the Project alignment, the absence of authorized landing sites represents a constraint to legal use of the low altitude airspace above the Project alignment. The County, however, generally prohibits free flight above the Rincon Beach County Park. (See City Council staff report Attachment J.)

The primary launch site for soaring activities occurs on private property, and is informally used. The launch site has not been officially sanctioned or recognized by the City. The private property(s), however, generally appear to have not prohibited launch activities to occur on their property historically and may grant

permission for launch activities. (See City Council staff report Attachment I) Likewise, the informal launch site is not currently recognized as, zoned for, or designated as a glider park or similar public recreational facility. Please see response to comment no. A2-5, above, for additional discussion.

A2-18 Pedestrians and cyclists traveling along an unprotected shoulder immediately adjacent to a federal highway with high traffic volumes and high travel speeds is inherently dangerous. (EIR, pg. 3-12.) In most circumstances where a suitable alternative route is available, pedestrians and cyclists are prohibited from traveling along the highway shoulder due to the potential safety risks. Informal and unprotected crossings of the UPRR corridor is trespassing through private property and also poses a significant safety hazard. According to a 2019 report prepared by the Santa Barbara County Grand Jury, there were a total of 20 railroad-related fatal accidents in Santa Barbara County during the four-year period from 2015 through 2018.[1] Of those 20 deaths, 19 (or 95% of the fatalities) were the result of pedestrian trespassing on the UPRR rail right-of-way. Replacing informal and unsanctioned railroad crossings with a safe and legal alternative improves public safety and guarantees the use of this public access way for the future.

The City's consulting traffic engineer has reviewed the proposed Project, including the eastern termination of the trail into the Rincon Beach County Park parking lot, and concluded that such a design does not pose a significant safety hazard. (See Exhibit 3, memorandum from TKM Engineering, dated February 17, 2022; see also City Council staff report Attachment C, Exhibit 3- EIR, Appendix J.) Numerous examples of mixed traffic environments are found throughout the coastal Santa Barbara area (e.g., Shoreline Park/Ledbetter Beach parking lots; Butterfly Beach; Oil Piers Beach, etc.) where pedestrians and cyclists intermix with vehicles in a slow travel speed environment without experiencing significant safety impacts to pedestrians, cyclists or motorists.

A2-19 The existing informal crossing at Bluffs I that provides access to the Seal Rookery from the Carpinteria Bluffs Open Space Preserve is an unsanctioned crossing. Future improvement of this crossing is anticipated in the City's General Plan and Bluffs Open Space Master Plan. It is expected that as part of any future development proposal on Bluffs I, a formalized rail crossing would be established.

While foot traffic across the UPRR corridor in the Project vicinity is unsanctioned and considered trespassing, soaring activities in the area also conflict with other

[1] See Santa Barbara Superior Court, 2018-2019 Grand Jury Report, Railway Fatalities in Santa Barbara County (June 13, 2019) *available at* http://www.sbcgj.org/2019/RailwayFatalities.pdf.

regulations specific to flying in the area. Further, part of the intent of the proposed Project is to address and correct the unsanctioned pedestrian and cyclist crossing of the UPRR corridor by providing a safe, formalized and legal crossing recognized by UPRR and the CA Public Utilities Commission ("CPUC"). Please see response to comment no. A2-5, above, for additional information.

A2-20 Commenters have asserted that "no aviation rules are being violated at this site." These assertions, however, do not provide substantial evidence that the FAA has officially recognized the legality of the "Bates Bluff airspace" or that the soaring activities are "fully legal and sanctioned." CEQA requires findings to be supported by substantial evidence. Substantial evidence includes "facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts." (CEQA Guidelines, § 15384(b).) Substantial evidence is not "argument, speculation [or] unsubstantiated opinion or narrative…" (CEQA Guidelines, § 15384(a); see *Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 583.) The appeal letter and commenter do not support these assertions with substantial evidence that soaring activities are legal and sanctioned in this area. Please see response to comment no. A2-5, above, for additional information.

A2-21 This statement is correct in so much as the proposed trail Project would not impact the glider's launch site. Discussion of the launch site is provided for the purposes of context, both to help explain how the pilots access and utilize the area for their flights, but also to acknowledge the informal nature of the activity in this location. The EIR analysis of free flight does not consider the preferred launch site as the grounds to disqualify free flight from CEQA.

A2-22 The EIR describes that the most common launch area is under private ownership, without any covenant that guarantees the continued use of the property for launch activities. The Project will not affect the launch site, this is correct. But the continued use of the private property for launching of soaring activities is not secured, and therefore the future of soaring opportunities accessed from said site cannot be taken for granted or assumed. Notwithstanding, the informal nature of the launch site does not factor into the analysis and conclusions drawn in the EIR with respect to impact significance. Rather the information about the launch site is provided for the purpose of context. Please see response to comment no. A2-5, above, for additional information.

A2-23 Neither Mr. Dennis Pagen, nor any other member of the soaring community has provided a quantitative evaluation refuting the findings of the Airflow Analysis (Luzzatto-Feliz, 2021). In fact, Mr. Pagen generally acknowledges that he "examined the various graphs and equations [in the Airflow Analysis] and find them to be reasonable and accurate, except for a few caveats…" which he lists.

(See Appendix B to Appeal Letter A2, p. 1, below.) Professor Luzzatto-Fegiz reviewed Mr. Pagen's comment letter and has prepared a detailed response refuting the concerns raised by Mr. Pagen. (See Exhibit 2.) The statement that "flight can only be maintained at Little Diamondhead if the existing geological features remain intact" is not supported by facts. (CEQA Guidelines, §§ 15064(f)(5), 15204(c), 15384.) As supported by the Airflow Analysis and Professor Luzzatto-Fegiz's response, a small portion of "Little Diamondhead" (the nose of the ridge as it descends to the UPRR tracks) would be re-graded for the trail; this amount of modification is very slight compared to the total ridge length, and would not eliminate the existing air flow currently supporting soaring over the majority of the bluff face / ridge top.

A2-24 It is not clear what location on County property this comment refers to when discussing rare windy days where pilots launch outside of the Rincon Beach County Park or any private property.

Areas below the "standard" launch site on the bluff face are located in UPRR right-of-way, which is private property. The appellant has not provided evidence that launching from this location is authorized for recreational use generally by UPRR or launch of hang gliders or paragliders, specifically.

If the appellant is referring to County property, it should be noted that the County does not permit launching from County recreation areas under County Code section 26-22. The City is not aware that the County has granted explicit permission to launch from areas owned by the County of Santa Barbara outside of a recreation area; however, given the County has generally prohibited launching and landing within the Rincon Beach County Park without permission, absent evidence that the County has granted permission, it can be assumed that permission to launch from the area below the bluff is not permissible under the County Code. (See City Council staff report Attachment J.) Please refer to response to comment A2-5, above, for additional discussion.

A2-25 With respect to the excerpted passage from the County Coastal Land Use Plan, "…recreational uses on oceanfront lands, both public and private, that do not require extensive alteration to the natural environment… shall have priority," (County Coastal Land Use Plan, Policy 7-6) the Project alignment consists of heavily modified terrain remnant from former transportation facilities. The slopes and benches the Project seeks to grade to accommodate the trail are not natural in form and would be re-graded to increase long-term stability.

The proposed trail use is consistent with the types of land uses anticipated in the transportation and recreation land use categories and the corresponding zone districts. Please refer to response to comment no. A2-4, above.

A2-26 Testimony provided by the soaring community at various public hearings may qualify as expert opinions with respect to personal soaring experience above various landform types, in given wind regimes. Soaring pilots are definitely well-versed in soaring characteristics and are very qualified to compile observations such as, “a steeper and higher bluff face leads to stronger uplifts.” And this comment refers to the type of evidence offered by members of the soaring community, with intimate knowledge of the wind flow over existing terrain, gathered from flights. Such pilots, however, are not experts in determining with any specificity the quantitative changes to airflow that would result from a detailed engineering plan prepared for the re-grading of the existing topography into the Project-resultant topography. (CEQA Guidelines, §§ 15064(f)(5), 15204(c), 15384.) Mr. Pagen claims to have the engineering experience to provide such analysis, and yet he does not in his comment letter specify the changes to be made to any assumptions for the modeling, or quantitative corrections to include as revisions to the Airflow Analysis (Luzzatto-Feliz, 2021). The soaring community has therefore not provided substantial evidence that the Project would have a significant impact on soaring opportunities nor that such impact would constitute a significant adverse impact on the environment to directly refute the air flow analysis or the EIR’s conclusions. Please refer to response to comment no. A2-5, above, for additional discussion.

A2-27 Again, Aaron LaPlante is a certified pilot, however, he is not a fluid dynamic engineer. His detailed account of how the trail will drastically affect airflow is in fact generalized conjecture without the benefit of any quantitative evaluation based upon Project grading plans. (CEQA Guidelines, §§ 15064(f)(5), 15204(c), 15384.) The link to the video is part of the public record and has been made available to all decision makers as part of the public comments submitted for the Project.

A2-28 Refer to responses to comments no. A2-26 and A2-27, above. Mr. Dennis Pagen, an engineer with flying experience, took the opportunity to comment and he did not provide detail to support any different conclusion. Specifically, he states “[t]he air flow reduction would be greater than 20%.” However, he does not provide substantial evidence or calculations to support this assertion. (CEQA Guidelines, §§ 15064(f)(5), 15204(c), 15384.) The Airflow Analysis (Luzzatto-Feliz, 2021), is substantiated, but the appellants’ and commenters’ criticisms of the Airflow Analysis conclusions have not been substantiated with substantial evidence or technical analysis.

A2-29 The Airflow Analysis (Luzzatto-Feliz, 2021) provides evidence that the Project would not result in the elimination of local air flow patterns that typically support soaring activities. Mr. Dennis Pagen indicates some assumptions that he

believes should be changed, but he neither identifies the manner to improve the assumptions for the analysis, nor the outcome or conclusions of the analysis were other assumptions to be employed instead. (CEQA Guidelines, § 15384.) Please refer to Paolo Luzzatto-Feliz's response to Mr. Denis Pagen's letter, where he refutes the concerns raised (Exhibit 2, Luzzatto-Feliz, 2022).

A2-30 Thank you for pointing out that parasailing involves a tow boat; the term is easily confused with paragliding, which is a soaring or free-flight activity using a frameless parachute. The parasailing reference in Exhibit 2 should be "paragliding" instead. However, the assertion that no "data or evidence" has been provided regarding the airflow impacts of the Project is incorrect; the Airflow Analysis (Luzzatto-Feliz, 2021), prepared by a highly qualified expert in fluid-dynamics, provides data and evidence to support the conclusions reached in the EIR.

A2-31 Wind gradient effects are explicitly included in the Airflow Analysis (Luzzatto-Feliz, 2021); please refer to Professor Paolo Luzzatto-Feliz's response to Mr. Dennis Pagen's letter for detailed discussion of wind gradient (Exhibit 2, Luzzatto-Feliz, 2022). One of the links provided in the comment is for a technical paper by Crawley & Schmanske; this paper was considered during preparation of the Airflow Analysis (Luzzatto-Feliz, 2021), as evidenced by the references to the Airflow Analysis [Crawley, E. F., & Schmanske, M. (1994): Optimum ridge lift: A scaled experimental investigation. Technical Soaring, 18(4), 120–128]. The second link provided in the comment is to an introductory-level primer on lift conditions along a ridge, which are described in greater detail in Mr. Pagen's publications cited in the Airflow Analysis (Luzzatto-Feliz, 2021). The turbulence effects cited in the comment letter were also included in the Airflow Analysis (Luzzatto-Feliz, 2021), based on works by Belcher & Hunt (1998), Bowen (1980), and Jackson & Hunt (1975).

A2-32 As a dedicated commercial facility offering both launch space and soaring lessons, Torrey Pines Gliderport ("TPG") has well-documented and substantiated data regarding the range of horizontal wind conditions that generally support launching of tandem and solo gliders. This range of wind speeds was one data point, among others in the Airflow Analysis, in determining if the magnitude of potential horizontal wind speed reductions resulting from proposed slope modification associated with the Project could eliminate conditions favorable to launching hang-gliders and paragliders in the vicinity of the Project alignment. As indicted in the Airflow Analysis (Luzzatto-Feliz, 2021) and response to Mr. Dennis Pagen's letter (Exhibit 2, Luzzatto-Feliz, 2022), modifications to "Little Diamondhead" are not anticipated to substantially reduce horizontal or vertical wind speeds in the low altitude air space above this ridge.

A2-33 The stability of the resulting slopes is addressed in Section 3.5 of the EIR; the minor reduction in the slope angle above the trail bench is intended to greatly improve the long-term stability of these slopes. The primary reason for former slope failure along the former railroad alignment was the creation of artificial slopes steeper than the natural slope angles. The proposed Project drainage system specifically addresses drainage control to minimize storm-water erosion within the Project alignment, and sea-level rise impacts are specifically also addressed in the EIR (Section 3.8).

As stated in the EIR (p. 3.8-12) by the Year 2100, there is a 2% probability of a 5-foot rise in sea level elevation along the coast adjacent to Carpinteria Bluffs and Rincon Point. Accelerated erosion would primarily result from wave action superimposed on the higher elevation sea level surface); however, the anticipated acceleration of bluff retreat rates from sea level rise have not been quantified. The proposed trail is set back from the base of the bluffs by a distance ranging between 60 and 100 feet horizontally. Even if the bluff retreat rates were to double from the influence of sea level rise (i.e., 1 foot per year), the closest portion of the trail to the base of the existing sea cliff would represent a horizontal distance equivalent to 60 years of erosion. While storm drain outlets on the bluff face may need to be periodically repaired or replaced in this 60-year period, the trail itself likely would not be threatened within this timeframe. For transportation infrastructure, a useful life of 50-75 years is typically employed (50 years for pavement, 75 years for bridges, Caltrans 2018). (EIR, p. 3.8-12.)

A2-34 The City, as the lead agency, has the discretion to consider a reasonable range of alternatives that would feasibly attain most of the basic objectives of the Project but would avoid or substantially lessen any of the environmental effects of the Project. (CEQA Guideline, § 15126.6(a) & (d); *City of Maywood v. Los Angeles Unified Sch. Dist.* (2012) 208 Cal.App.4th 362, 414; *South of Market Community Action Network v. City & County of San Francisco* (2019) 33 Cal.App.5th 321, 345.) The level of analysis of each alternative also is subject to a rule of reason and does not need to be an exhaustive evaluation of each alternative. (*Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 547.) An EIR need only contain sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. (*Id*.; CEQA Guideline § 15126.6(f).) Please refer to the previous response to comment no. A1-3, above, for further discussion of alternatives.

The purpose in an EIR of examining alternatives to the proposed project is primarily to determine if the major objectives of the project could be achieved in a manner that reduces potential impacts on the environment, compared to the proposed project. One of the key objectives for the Project, which has been identified since the 1980's, is to close the existing local gap in the California

Coastal Trail (CCT) system. With regard to Carpinteria, a trail consistent with the goals and objectives of the CCT would be located between the very busy U.S. Highway 101 Corridor and the Pacific Ocean. Within this area, a total of four alternatives were examined to reduce potential impacts of the Project on the natural environment. Examining other alternatives is beyond the requirements of CEQA, which stipulates the range of alternatives examined need not be exhaustive. (CEQA Guidelines, § 15126.6(a) & (d); *City of Maywood v. Los Angeles Unified Sch. Dist.* (2012) 208 Cal.App.4th 362, 414; *South of Market Community Action Network v. City & County of San Francisco* (2019) 33 Cal.App.5th 321, 345.) The suggestion of providing a barrier separation between vehicle traffic on U.S. Highway 101 and cyclists along the shoulder of the southbound lanes "similar to the continuance of the trail, east of Bates Road" ignores the fact that a bluff is not present between the bike path and the ocean southward/eastward of Bates Road; ocean views are available to cyclists as they use the existing path. Hence, such an alternative could not be found to have met key Project objectives. It also overlooks horizontal space limitations that exist within this portion of the U.S. Highway 101 corridor, where a third travel lane was recently added, without expanding the right-of-way width for the freeway.

The statement, "The City has not provided substantial evidence and/or sufficient analysis of exploring any alternatives on… the north side of "Little Diamondhead," which is aligned with the U.S. 101 southbound side of the highway" is conclusory and inaccurate. In fact, discussion with the community led to the development of the completely new "Alternative 4", which has been *added* to the EIR, and studied with substantial effort.

A2-35 The Final EIR provides a written response to each and every comment received on the Draft EIR consistent with CEQA Guidelines section 15088. (See CEQA Guidelines, §§ 15088(c), 15204(a).) While the comment presents a broad allegation of the inadequacy of the content of responses in the Final EIR, no specific examples are given of individual responses that are inadequate. (CEQA Guidelines, §§ 15088(c), 15204(a).) The implication that the "majority" of the responses are inadequate is conclusory. The majority of the Planning Commission present at the hearing in voting to accept and certify the EIR for the Project found the EIR to be sufficient and to have satisfied the statutory and procedural requirements of CEQA.

A2-36 The approval of the Project design by the City ARB and County BAR is important to ensure the physical elements of the Project, including fencing, the UPRR Bridge, and pavement treatments are consistent throughout the Project, regardless of jurisdiction. The scale and appearance of these improvements will, however, remain subordinate to the overall scale of the Project and visibility of the resulting graded areas. In regard to grading, the slopes to be modified have

not formed naturally, but instead resulted from former transportation Project grading. These slopes are currently very regular, consisting of inclined planes, rather than the undulating landforms produced by natural erosion processes; relatively sparse vegetation has established over time within these steeply graded slopes. The new slopes would have a similar overall appearance at distance to the existing slopes but would at first be lacking any vegetation. One of the more important aspects of ensuring the Project visual impacts would be mitigated is the planting of the slope areas, to more closely re-create the visual character of the most visible elements within the Project alignment.

While presented as a biology mitigation, MM-BIO-5 would also provide additional mitigation by restoring native habitat on the current, over-steeped manufactured slopes that dominate the existing visual resources of the Project alignment. Mitigation Measure MM-BIO-5 is provided below:

MM-BIO-5 *Habitat Mitigation and Monitoring Plan. Prior to approval of a coastal development permit, the City shall contract with a qualified biologist to develop a Habitat Mitigation and Monitoring Reporting Plan (Plan) to mitigate for impacts to County ESH/City ESHA vegetation communities. The Plan shall outline efforts to restore or enhance coastal sage scrub and coastal bluff scrub communities, and, therefore, preserve or provide wildlife habitat, in areas temporarily impacted by construction of the trail and within similar habitats adjacent to the impacted biological resources.*

Please also refer to response to comment no. A2-4, above, for additional information.

A2-37 The concrete “rip rap” which was placed by Caltrans at the outfall of their storm drain will remain because, as has been previously stated, this area is outside of the footprint of the Project. (FEIR, response to Comment Letter 01, pg. 63 of PDF).

In terms of “gullification” of the four drains constructed by the Project, two already exist and will be replaced; so the Project only introduces two new drains. All the drains will be buried to minimize visual impact. One of the old drains, namely the rusted old storm drain which exists on the beach will be replaced with a new, smaller, buried drain.

As part of the design process, the engineers have specifically addressed impacts to the beach to avoid such “gullification”. Therefore a plan to “spread out” the water, using more drains, coupled with natural rock placed strategically at the outfall to dissipate energy from the flowing water, has been implemented. Mitigation is also included to require the ongoing upkeep and maintenance of

these drainage facilities for the life of the Project in order to ensure proper functioning of storm drainage improvements. (EIR Section 3.8, pg. 3.8-16).

A2-38 Refer to responses to comments nos. A2-1 and A2-2 of the Orbach Huff & Henderson LLP appeal letter.

A2-39 If constructed as proposed, the trail Project would indeed offer an alternative to vehicle travel at the very least between the eastern terminus of Carpinteria Avenue/Carpinteria Bluffs Preserve and Rincon Beach County Park/Rincon Point residential neighborhood. However, given it closes a gap in the already extensive local portion of the California Coastal Trail system, the likelihood is that it will effectively support cycling as an alternative transportation mode between Ventura and Carpinteria. As such, Measure A funds applied to the Project are completely appropriate.

A2-40 Analysis of the stability of the completed slopes is one component of the engineering required for this Project, and the geology here is fairly complex. Therefore, the City's "assessment" included investigation and analysis on multiple levels, by multiple engineers from different disciplines (Civil Engineers, Engineering Geologists, Geotechnical Engineers) whose work included field testing, trenching, test pits, borings, record searches, and reviews of previously completed projects, in addition to computer modeling and numerical analysis.

It is important to note that this ridgeline is not a natural landform, instead it is a remnant left over from many grading operations which started with the original construction of the Southern Pacific Railroad in the late 1800's. After building the railroad, this ridgeline has been altered again and again. Projects subsequent to the railroad include the construction of Hwy 2 in 1929, more work to Hwy 2 in 1937, a realignment of this same section in 1949, and finally complete relocation of the Southern Pacific Railroad and the freeway in 1970. The "ruins" of the old walls further east provide a glimpse of where Hwy 2 was previously located, and the ridgetop "windsock" used by the paragliders is in the middle of the old Hwy 2 alignment.

Today it is hard to believe how much earth was moved to build the current U.S. Highway 101 and to move the UPRR to the current alignment. What is referred to as "Little Diamondhead" is the left-over sliver of ridgeline where the old railroad and the current railroad rejoined their alignment.

With the area influenced by the all the grading and earthwork of these past projects, engineers were faced with the task of selecting a feasible alignment to cross the railroad with a bridge on the remaining, heavily altered, landform. Selecting this alignment required that the engineers consider grades, geology,

right-of-way, construction staging, and environmental impact, along with feasibility, slope stability and cost. Building the proposed bridge is not a trivial matter in itself; this is a long structure which will be built on a substantial foundation.

Indeed, this Project is located on “fairly steep slope[s]”. This Project faces some of the same engineering and construction challenges as the past projects mentioned previously, and just like those past projects, the Rincon Trail Project proposes to grade a portion of the ridgeline to accommodate the current project goal. Nevertheless, the maximum height of the ridge is expected to remain unchanged.

A2-41 No construction of the Project has begun. The alleged completion of the “foundation of the NW bridge buttress” is inaccurate; no portion of the Project, including but not limited to the “foundation,” have been constructed. However, the team has performed excavations for various investigations, including borings and trenching for the project-specific geotechnical reports, and to support required cultural resources investigations. To accomplish this work, we have obtained the appropriate approvals. Information collection activities also are generally categorically exempt from CEQA pursuant to CEQA Guideline Section 15306.

A2-42 Economic considerations, including construction cost of the proposed Project and/or Project alternatives is not within the purview of CEQA. CEQA is, instead, concerned with evaluating the potential environmental effects of a given project. (See, e.g., CEQA Guidelines, § 15064(e).)

A2-43 While the header of the I33 response incorrectly identifies the comments as having been provided by Ottis Gillespie (this was inadvertently carried over from the response to I-32), the responses provided under I-33 do in fact address Tim Barker’s comments, labelled as comment letter I33.

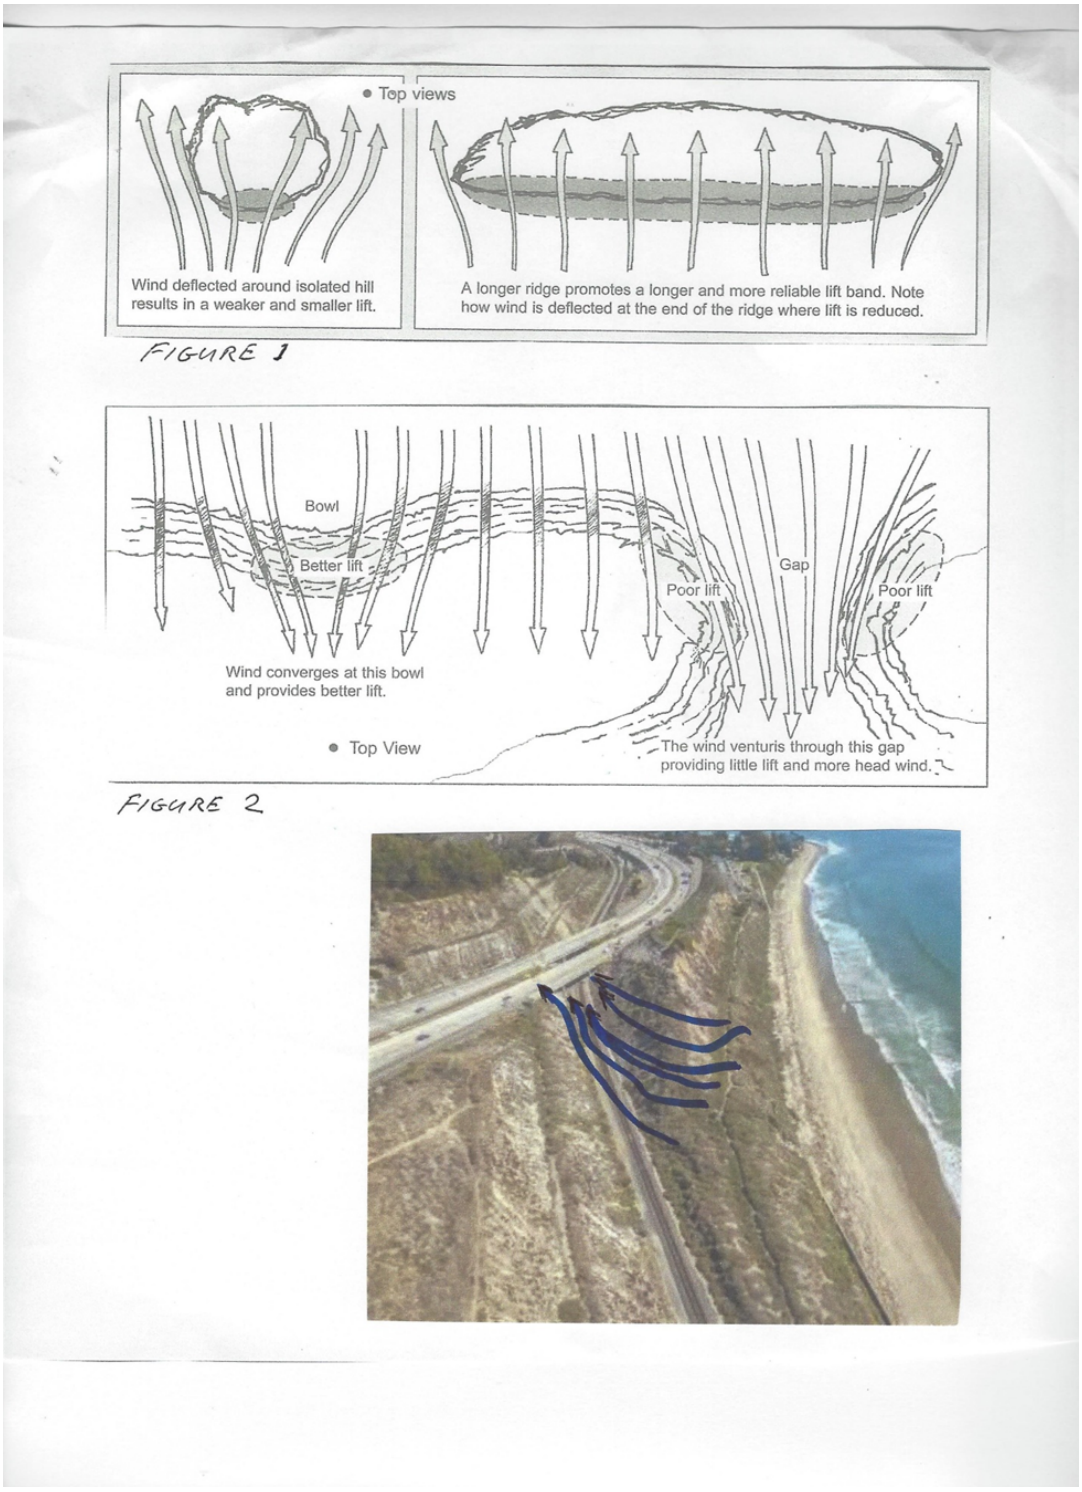
With respect to the charge of “dismissive or canned” responses, it is common practice in preparing responses to comments as part of an EIR to refer the reader back to previous comments that address the issue raised. (See CEQA Guideline, §§ 15088(c), 15204(a).) Further, if a statement does not address a CEQA issue or does not provide a substantive comment requiring further discussion or revisions to the EIR, it is appropriate to describe the statement as such in order to acknowledge the comment but make clear that no further discussion is warranted to respond to the comment.

Appendix B:
Letter from Dennis Pagen

January 17, 2022

To: City of Carpinteria Planning Commission
Re: Agenda Items #2, Rincon Trail Project

I am writing to offer information and opinions regarding the proposed Rincon Project and the intended alteration of the landscape to extend a bike path into the area in question. My interest and qualifications for commenting here are two-fold: I have been a hang glider pilot for 48 years and a paraglider pilot for 32 years. Also, utilizing my degree in engineering and physics, I studied micrometeorology intensively and wrote the book Understanding the Sky, which is used in many forms of aviation and is quoted in your EIR proposal. In addition, I wrote the book Art of Paragliding, which is also referenced in your document. A2-44



To begin, I have examined the various graphs and equations and find them to be reasonable and accurate, except for a few caveats, which I shall list and address below.

1. The most important misconception in this EIR analysis is that it is limited to two dimensions. In other words, it only looks at the vertical and incoming flow of the air. However, we all know that the flow of air is so fluid that it moves in all directions—forward and back, left and right and up and down. Because this site is limited in its width with respect to the incoming wind (perpendicular to the slope face), there will be some flow moving slightly sideways to escape into the opening or gap near the railroad tracks as a result of the extensive excavation needed to connect the bridge to the path. We can visualize this phenomena by thinking about a rock in the middle of a fast flowing stream. In this case we will see a bit of pile-up of water in front of the rock, while most of the water splits to flow around either side of the rock. The air flow around a protruding hill is nearly identical to this observed water flow. Figure 1 illustrates this effect. A2-45

If we further visualize a broader rock or perhaps a short wall perpendicular to the water flow, we will see that there will be more pile-up of water in front of the obstruction (wall), while there is still plenty of water that escapes around the sides of the wall. In the free air flow the wall is analogous to a ridge as opposed to a single hill limited in width. It should be clear that the wider the obstruction, the more it presents lift in front of it, and the smaller the percentage of flow that escapes around the sides compared to the total volume of flow meeting the obstruction face.

This natural behavior of water and air means that any alteration in the width of the small ridge at this particular soaring site will render it less soarable and undesirable as a flying site. In fact, it may become non-soarable except in a perfect wind direction (an infrequent occurrence at this site) or higher winds, which increases the inherent dangers. Not only is the lifting area reduced, but the increased flow into the proposed larger gap near the RR tracks will make it harder and

more dangerous to cross the gap to reach the higher, more soarable area of the ridge. It should be noted that all craft operating in a fluid (boats and aircraft) must point a bit into the flow in order to move in a direction crossing the flow. With a higher wind flow in this gap, the crossing will be slower and may not be possible at all if the glider's energy and altitude is expended in countering this increased air flow. Figure 2. Illustrates this matter.

A2-45 cont'd

Another factor that the three-dimensional flow introduces is that lift is reduced due to some sideways flowing of the air. So while the diagrams presented in the EIR purport to show a 10 to 20% reduction in lift, it will be a greater reduction if any amount of the ridge width is reduced. In other words, the graph presented are not representing the true effect of the proposed alteration of this site. When air flows faster in a constricted tube or through a narrow gap, it is known as a venturi effect. Pilots learn to avoid venturis because of the inability to penetrate against them and the possibility of stronger and even dangerous turbulence. This result is similar to an airplane flying into a jet stream with its extremely strong flow and often strong turbulence.

A2-45 cont'd

It is curious to note that while the EIR refers to many illustrations from my books, it does not reference any top view (plan view) illustrations, which provide the most meaningful understanding of the wind flow. For example, figures 13-7, 13-9, 13-10, et. al. in The Art of Paragliding clearly present the wind's behavior in gaps and along ridges. It's as if the analysis of a building's structure was presented only as side view elevation, without any top (plan) view or front elevation view. The limited information may be accurate, but is inconsequential in light of the need to fully understand the structure.

2. An additional error in the EIR is not taking into consideration the effect of wind gradient. The wind gradient is shown in the left vertical graph in figure 1 of the EIR. It shows the normal situation whereby the wind flow is slowed near the ground and increases as elevation increases (this slowing is due to friction and drag of the ground itself and ground objects, such as rough terrain, bushes, rocks, etc.). In brief, the wind gradient actually reduces the amount of lift created at the top of a slope—the greater the gradient, the less lift. What isn't mentioned in the EIR is that the flatter the slope, the thicker the layer of reduced flow is, so more lift is lost. As a side note, much of the lift at this site gets a boost from the heating of the beach area below. This heated air joins the general flow up the slope and makes it more buoyant. But with a flatter slope the rise of the buoyant air is not added to the general uplift as much because it tends to sidle along the surface rather than lift off due to the inertia of its mass (air weighs a surprising 0.08 lbs. per cubic foot). Thus, we can conclude that reducing the steepness of the slope will reduce lift more than the projected 10 or 20%.

A2-46

3. The next point of concern is the added wind speed and turbulence caused by the alterations proposed. First, it should be pointed out that hang glider and paraglider plots would have to fly in the area where turbulence can form and pass through as a result of the bench cut into the bluff for the path. Thus they will experience ground turbulence. An increase in this turbulence will increase the dangers. The statement in the EIR that increase in turbulence shouldn't be a problem was probably influenced by the opinions of sailplane pilots who can handle stronger winds and turbulence due to their aerodynamic controls. In fact, in my experience throughout the world, I know of only two places that sailplanes take off close to the ground at the top of a ridge. Because hang glider and paraglider pilots must take off right at ground level, it should be clear that any added turbulence at this site can be life-threatening.

A2-47

The EIR illustrates what appears to be a large eddy (swirl or rotor) at the bench area in figure 1 on the right side. This eddy is assumed to remain there out of play of the pilots launching or flying near the slope. However, experience has shown that such an eddy only remains stable in

lighter wind conditions when the wind is fairly perpendicular to the bluff face. In other conditions, the eddy can break away from its position at the bench, travel up the slope and become a serious hazard before it drifts downwind and gradually diminishes. In other words, the current profile of the slope presents a small eddy from the old RR bench that must be considered and countered by pilots flying at this site. But if a wide bench is created higher up the slope, or if the slope is reduced, the frequency of eddies impinging on the site will be increased, first by the deeper and higher bench resulting in more eddies, but more importantly by the fact that a lesser slope makes it easier for the eddy to break away and travel downstream, since it doesn't have to climb as steeply and do work against gravity.

A2-47 cont'd

4. Finally, it should be noted that the EIR references studies done in wind tunnels mainly as well as studies conducted by pilots from the sailplane community. Much of this data doesn't apply in the real world where matters can be and are often different than the closely controlled laboratory (as actually noted in the EIR). In fact, the best empirical data comes from the tens of thousands of flights conducted at this very site and more importantly from the hundreds of thousands of flights experienced by pilots of all sorts at many sites around the world that are very similar to the Rincon bluffs. Most pertinent to the point is that pilots of these small aircraft can fly very close to the terrain and gain much experience relating to the air flow and turbulence effects in real situations that cannot be duplicated in the laboratory and cannot be acquired any other way. So it is hard to understand why the local hang gliding/paragliding community wasn't consulted when this analysis was created. It would behoove all involved to proceed with this liaison in order to get a clear picture of the effect of the alterations and to understand how much the reduction of lift will diminish the possibility of this form of recreation.

A2-48

Respectfully Submitted,

Dennis Pagen

CAUTION: This email originated from outside the City of Carpinteria. DO NOT OPEN attachments or CLICK on links unless you are sure they are safe. Remember, reputable vendors, banks, etc. will not ask you to disclose passwords or other sensitive information.

January 28, 2022

Mr. Nick Bobroff, Principal Planner
Community Development Department
City of Carpinteria
5775 Carpinteria Avenue
Carpinteria, CA 93013

Dear Mr. Bobroff:

The focus has been on bike safety in the parking lot. I would like to addresss the area of Rincon Point Rd. (i.e. the end of Bates rd).
Plan 3, the plan adopted, will promote Bikers diangolnally crossing into the Rincon parking lot.
Even with a car one has to (or should) approuch the lot gingerly becausde of bad sight-lines. This will also make bikers more assesable to colliding with cars from the Rincon Point parking lot. A3-1

Also one must be aware of the increase of use of Electic bikes. Electic bikes are great because they have expanded the ridership range for biking. But it must be noted that Electirc bike riders tend to not be seasoned bike riders. This along with the fact the bikes go fast has made it a saftey situation. We have one person in our community that broke her back, during a crash becasue she couldn't control her bike. This also still encourages more bikers into the parking lot. There has been more than one collision. One even resulting in a broken leg. A3-2

If the bike trail continued on, the south bound 101, shoulder it could be easily marked with a straight path. There would be less confusion on where the bikes travel. I prefer a protected lane over ocean view. Especailly for such a short distance. A3-3

Also to utilize the south bound shoulder would not require the huge dirt removal, which environmentally damaging. And hopefully making the freeway route cheaper too? A3-4

Also would it be possible to have a tunnel for the Train Track crossing instead of a Bridge? A3-5

Thank you for your time,
With all my Biking Heart,

Helen O'Neill

Response to Appeal Letter A3

Helen O'Neill
January 28, 2022

A3-1 Currently, the coastal bike trail extending north from Ventura County terminates at Bates Road. Cyclists must enter or cross Bates Road near the U.S. Highway 101 southbound ramps, by choosing to either continue on Bates Road for travel to northern destinations or cross into the Rincon Beach County Park. Consequently, there are already cyclists completing the maneuver for which you have stated a safety concern under current conditions in one direction. The entrance to the Rincon Point State Beach parking lot also is generally on the opposite side of Bates Road from the Rincon Beach County Park parking lot entrance, which introduces some impediments to smooth flow or high vehicle maneuver speeds along this segment of roadway. As such, cyclist and pedestrians leaving from the Rincon Beach County Park under the proposed Project or other alternatives or from the end of the Alternative 4 trail and navigating the Bates Road intersection would be present in any of the Alternatives. The City consulting traffic engineer has suggested specific markings to make the trail alignment more visible and to increase driver awareness to further reduce the potential for automobile and bicycle conflicts; some of these same measures could be considered at the bike crossing point of Rincon Point Road. (Exhibit 3, TKM memorandum, February 2022; see also City Council staff report Attachment C, Exhibit 3- EIR, Appendix J.).

A3-2 Electric bikes are already in use on the coastal bike trail extending north from Ventura County and on roads within the City and County, including Bates Road. While electric bikes in some cases for certain individual may allow a higher speed than can be achieved by conventional self-propulsion bicycles, electric bikes would typically occur in a mix with conventional bicycles on existing and future bike paths, with the conventional cycle speeds limiting the general speed of the overall cycling masses. Also, it is not the speed capability of the cycle, but the judgement and awareness of the cyclist that must be counted on to avoid accidents, just as with high performance automobiles mixed in with slower vehicles on roadways and highways.

As discussed in the City's consulting traffic engineer memo, (Exhibit 3, TKM memorandum, February 2022; see also City Council staff report Attachment C, Exhibit 3- EIR, Appendix J), the use of parking lots for mixed-vehicle travel is not unusual and is not generally considered to be dangerous. Such parking lots are, by their very nature, slow speed environments. Further, the introduction of additional bicycles and pedestrians into a mixed-traffic setting is likely to further improve safety by encouraging motorists to be more vigilant of pedestrians and

cyclists using the lot. The trail exit/entrance and parking lot would be signed with appropriate safety and directional signage alerting trail and parking lot users of the mixed traffic environment. It is the responsibility of trail users and parking lot users to follow posted safety signage.

A3-3 The proposed multi-use path is not intended to be solely a bicycle path that connects to the Pacific Coast Bikeway. Rather, it is intended to be a multi-use path that can serve a variety of trail users with different objectives, including enhancing pedestrian/cyclist access to Rincon Beach County Park and the vertical coastal access points within the County Park. Such a trail would not meet the Project objectives.

Further, placing the bike path on the shoulder of the highway is not a viable option. Caltrans has previously indicated that there is not sufficient width on the existing highway bridge overpass over the UPRR corridor to accommodate the multi-use path. There is also not sufficient shoulder width along portions of the highway between SR 150 and Bates Road to accommodate the proposed trail and maintain an emergency lane for vehicles.

A3-4 Please refer to the response to comment A3-3, above, in the Helen O'Neill appeal letter.

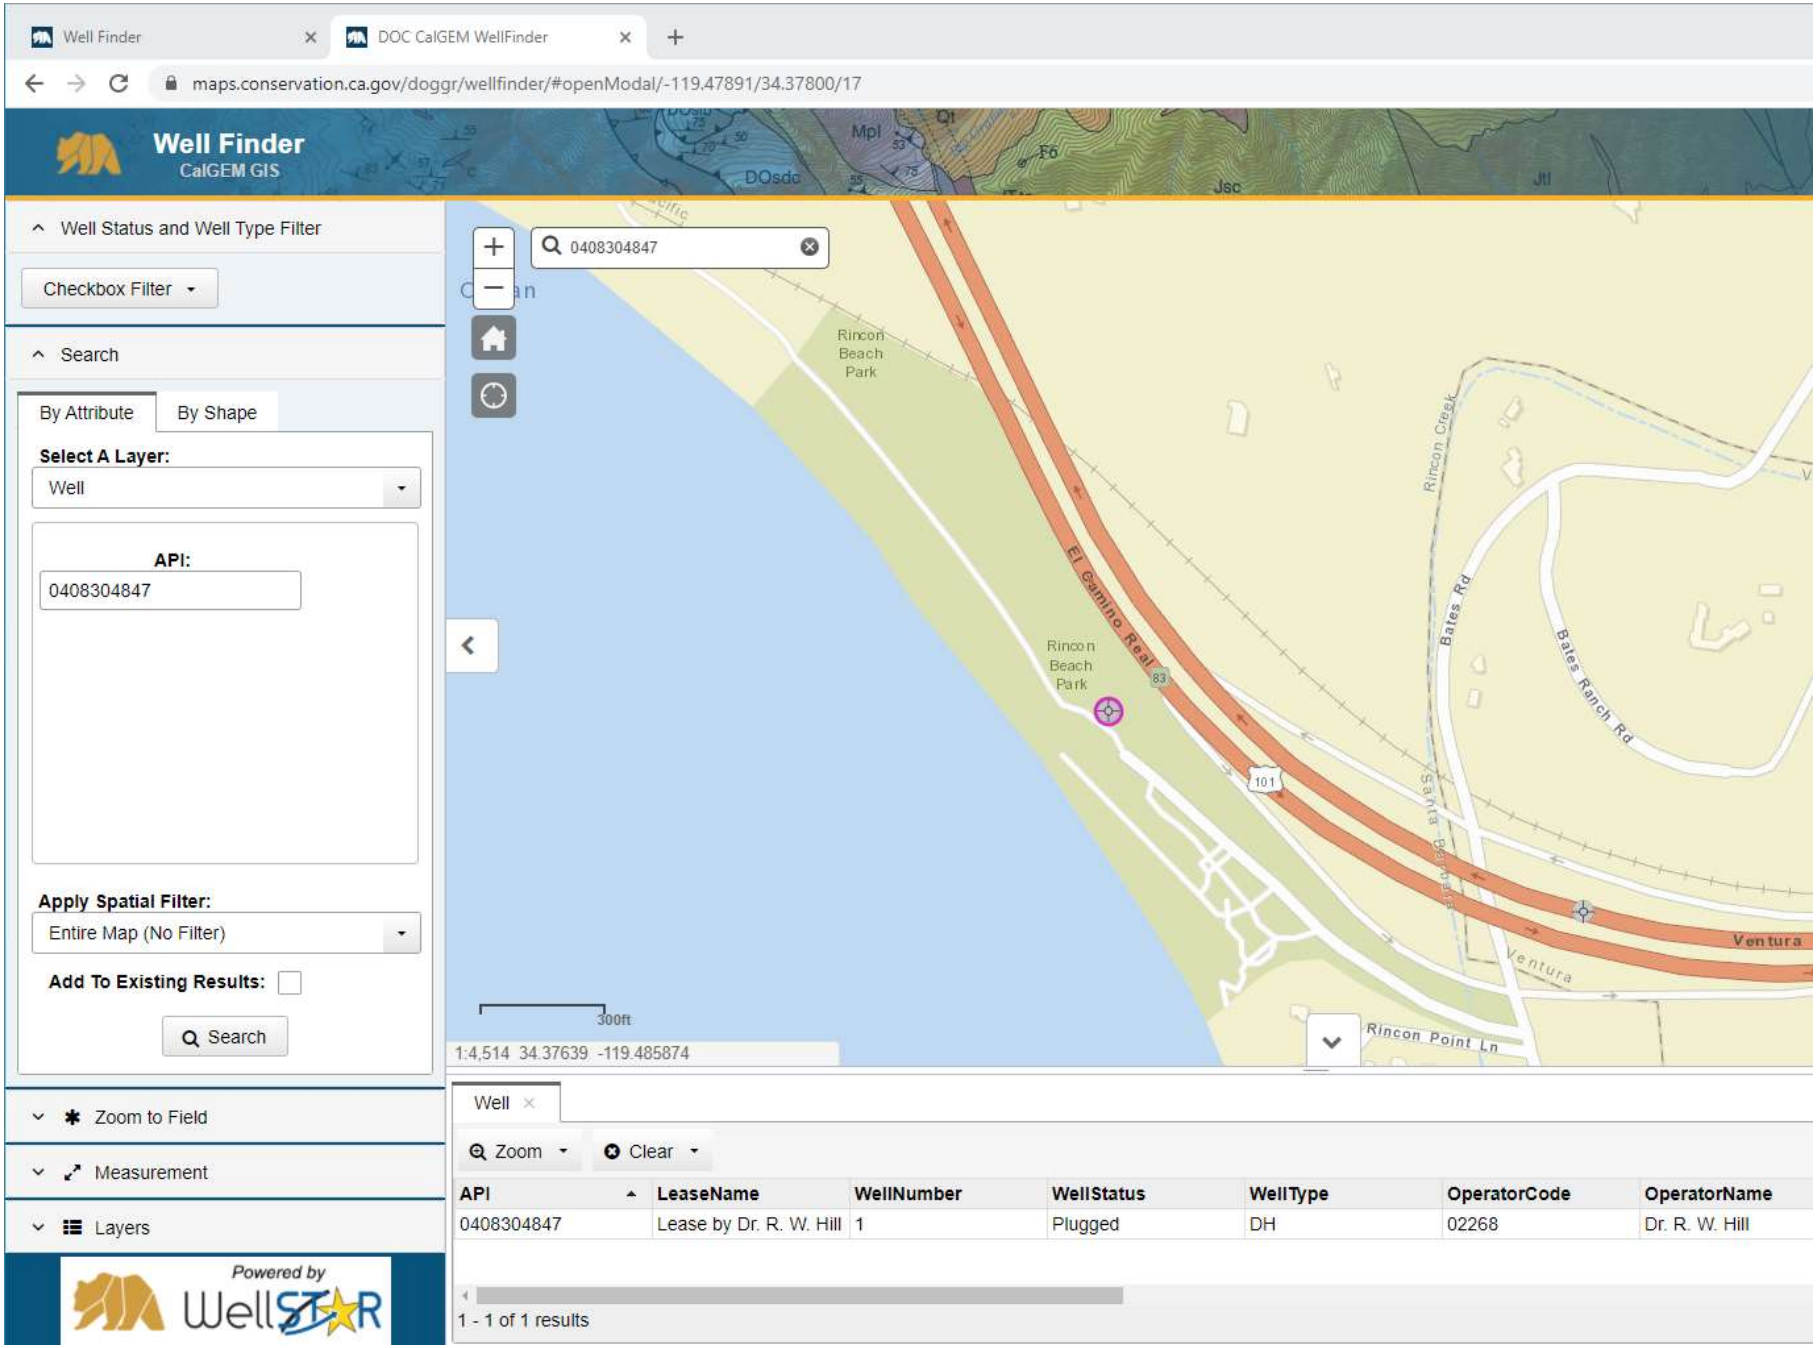
While it might seem like a relatively simple undertaking, widening the south bound shoulder of U.S. Highway 101 for a bike path is not a trivial matter. Such an undertaking, on a multi-lane highway includes accommodation of a crash-resistant safety barriers like those at Ortega Ridge in Summerland or the Mussel Shoals. In this area, widening the freeway corridor to provide the room for the safety barrier and the trail would require significant earthwork and significant traffic control measures during construction, like you see currently underway further south in Carpinteria.

Adding another construction complication, much of the southbound shoulder is already occupied by a "new" sewer pipeline which is pumping sewage from the lift station in Rincon Beach County Park to Highway 150. Impacts to this sewer pipeline, including possible relocation, will need to be studied if this option were to go forward. The utility agreements, construction accommodations, and construction staging to move the sewer, if needed, would likely be very complicated, time consuming, and expensive.

A still greater challenge would be either widening the existing U.S. Highway 101 bridge over the UPRR, or building a new, separate, bridge for the trail alongside U.S. Highway 101. Because this bridge would be much longer than the preferred

alternative and would be built in a location with poor construction access, this option presents greater engineering hurdles and cost than other alternatives.

Lastly, when completed, if the trail were built to follow the steeper existing freeway grades, users will face steeper uphill profile grades as they travel west along most of the run from Bates Road to Highway 150, in comparison to other alternatives. Such a design would likely not comply with ADA design standards, which would limit the utility of such a trail to the broadest range of potential users, inconsistent with the Project Objectives.



To overcome these detriments, Alternative 4, has been presented in the EIR as a more feasible approach to accommodate the idea of a trail located in the existing highway corridor, but with less environmental impact and less cost, and to provide a wider, gentler trail.

A3-5 Tunneling underneath the UPRR corridor for the trail would not be cheaper, easier, or meet ADA accessibility requirements as the profile grade required to descend to this elevation would be too steep to be feasible. Further, such a design is not likely to receive approval from UPRR.

Exhibit 2: Response to Dennis Pagen Comment Letter Prepared by Paolo Luzzatto-Fegiz, PhD, dated February 25, 2022

Rincon Trail Project Appeal
19-2015-CUP/CDP
City Council Hearing, March 28, 2022

Response to Mr. Dennis Pagen' Comment Letter of January 17, 2022

Planning Commission Agenda Item #2 (Rincon Trail Project)

Paolo Luzzatto-Fegiz, PhD

February 25, 2022

Introduction

Mr. Pagen's comment letter primarily addresses the evaluation methods and conclusions of the airflow analysis that I previously prepared for the proposed regrading of the Rincon bluffs. For this reason, I have been asked to respond to the comments in Mr. Pagen's letter.

First, I would like to thank Mr. Pagen for contributing his expertise, and for offering the information and assessments summarized below. It is valuable to know that Mr. Pagen generally finds the calculations employed in the analysis to be reasonable (under the given assumptions). We address below the thoughtful additional concerns and caveats raised by Mr. Pagen, using the same numbering organization for our responses as in his letter. An overall clarification is that, although qualitative discussions of the flow are of course conceptually useful, the analysis was designed to provide quantitative estimates of the airflow changes, which are necessary for decision-making. In the discussion below, we also seek to provide quantitative estimates of the effects that are qualitatively discussed by Mr. Pagen.

Comment #1

Mr. Pagen expresses the concern that the air flow analysis was limited to a two-dimensional evaluation, assuming an incoming wind direction perpendicular to the ridge, which may not match conditions in the natural environment, where airflow may approach from different directions (in other words, with different yaw angles).

It should be clarified that, when one analyzes airflows that are not perpendicular to a ridge, a well-established approach is to consider separately the wind velocity components that are parallel and perpendicular to the ridge. The topographic acceleration and uplift are then calculated using the perpendicular wind component. This approach is attributed to Baker (1985), who justified it intuitively by pointing out that only the airflow component that crosses the ridge will experience changes due to topography. Several studies have since tested Baker's approach, using both experiments and field measurements (see for

example Rowcroft et al. 2015, Barthelmie & Pryor 2018). It has been found that, for yaw angles smaller than approximately 30 degrees (defined so that zero degrees represents wind perpendicular to the ridge), Baker's approach provides a good approximation; the accuracy of Baker's approach progressively reduces for larger yaw angles. For reference, for the Rincon site, a wind rose generated by the micrometeorology service windy.app (whose products are targeted also to the paragliding community) indicates a prevalent wind direction corresponding to a yaw angle of less than 30 degrees (see Fig. 1), indicating that Baker's approach is appropriate.

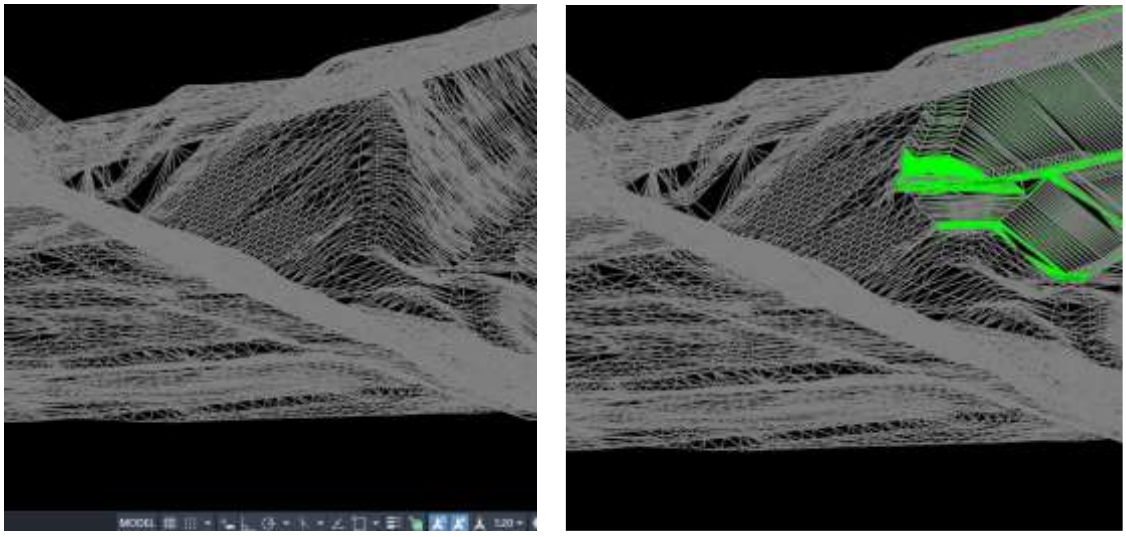

Figure 1. Estimated wind statistics for the Rincon site, from the micrometeorology service: https://windy.app/forecast2/spot/35515/Rincon%2C+United+States/statistics

Mr. Pagen expresses particular concern that the grading modification for the southerly UPRR bridge landing and overlook area would widen the canyon associated with the UPRR tracks, to an extent that would negatively affect the entire ridge with respect to wind flow conditions for soaring. Mr. Pagen proposes that the widening of the canyon may result in a substantial amount of the wind wrapping around the end of the ridge, rather than flowing across the ridge.

To help appreciate the significance of the proposed lowering of the upper slope at the southerly bridge landing and overlook area, it is useful to refer to the scale of this aspect of the project. The overall height of the bluffs is approximately 150 ft, and its length from the south/east side of the UPRR tracks to the Rincon Beach County Park is approximately 1,200 ft. The height reduction will be approximately 22 ft over a length of about 160 ft – this constitutes approximately 15% of the height over 13% of the ridge length, corresponding to approximately 2% of the ridge frontal area. Therefore, comparing the scale of the proposed ridge reduction and associated widening of the gap (along the UPRR corridor for the southerly bridge landing and overlook area) to the size of the entire ridge, one would expect that this portion of the project would not influence wind flow over most of the 1,050 feet of the ridge length, where the ridge elevation would be unchanged.

Three-dimensional drawings of the existing ridge and of the proposed alterations for the southerly bridge landing and overlook area have been supplied by the engineering team, and are shown in Fig. 2, to help convey the scale of the modification.

Existing topography of proposed bridge landing area and overlook.

Topography with proposed grading for bridge landing and overlook.

Figure 2: 3D wireframe drawings, comparing the existing and proposed topographies for the bridge landing area and overlook.

Comment #2

Mr. Pagen is concerned that the wind flow analysis may not account for the effects of wind gradient, and for the effects of buoyancy due to air heating along the beach surface. In brief, wind gradient effects are already included in the second analysis listed in the EIR, which used empirical data for conditions where a gradient was indeed present. Effects of heating, for this specific site, can be estimated to be small, by comparison to the vertical momentum imparted to the airflow by the interaction with topography. Furthermore, as pointed out by Mr. Pagen, the effect of buoyancy is to enhance uplift; therefore any buoyancy effects would actually mitigate lift reduction, implying that the aerodynamic analysis is conservative in this respect.

To further clarify the matter of wind gradient effects, it may be of interest that wind gradient is actually the key complication that prevents the application of more manageable mathematical models for flow over complex topography. For this reason, the second analysis in the EIR used the experimental data of Bowen & Lindley (1977), whereby a

wind gradient had been generated ahead of the topography. The gradient was designed to be representative of flow over land and was therefore stronger than the gradient that develops over the water surface and over coastal areas. (More specifically, the experiments had a gradient height that was 20 times the height of the topography, with an exponent of ⅙.) Therefore, effects of wind gradient are already accounted for, and the analysis is expected to be conservative in this respect.

To comment on the concern about heating, we further clarify that the significant effect is the relative decrease in density in the air, which is associated with an upwards force (that is, buoyancy) for the airflow. Even when buoyancy is absent, experiments have shown that switching to a flow that would "sidle along the surface" would require a much smaller slope than planned in the re-grading project (Bowen & Lindley 1977). This is already true in a neutral buoyancy regime; if the flow benefits from some buoyancy effects, the result will be an uplift that is actually less sensitive to slope reductions.

As a brief aside, if one were to nevertheless estimate whether buoyancy is currently providing an important contribution to the uplift, one could calculate the relative order of magnitude of the buoyancy force, as compared to force imparted by the slope alone. The details are more technical than what can be included here; in brief, due to the relatively short path of the airflow over the beach, and due to the steepness of the topography, the contribution from buoyancy is of the order of 5% of the total vertical lift.

Comment #3

Mr. Pagen expresses a concern that air turbulence, which may be dangerous for soaring pilots, could be substantially increased with the addition of a second upper bench at an elevation above the trail bench along the existing ocean bluff face (i.e., the portion of the trail south/east of the UPRR tracks).

It should be noted that the upper elevation bench has been removed in the proposed regrading, and the project no longer includes a mid-elevation bench above the trail for the segment to the south/east of the railroad alignment. This will result in a finished slope angle similar to the existing one, with the same number of benches, thereby minimizing any added turbulence.

Comment #4

Mr. Pagen expresses concern that wind tunnel experiments and mathematical modeling are necessarily different from real world conditions experienced by the soaring community and feels that data from the soaring community should have been sought for preparation of the analysis.

We appreciate this comment and agree with Mr. Pagen that any analytical method or experimental model must be developed with the support of real-world data. We would like to clarify that although the analysis indeed made use of wind tunnel experiments, these experiments had been extensively validated against measurements and analysis of wind flow over large-scale landforms in the natural environment (see for example: Bowen 1980; Teunissen et al. 1987; Emeis et al 1995; Glanville & Kwok 1997; Holmes et al 1997; Conan et al. 2016; Lange et al. 2016; El bahlouli et al 2020). This agreement between flows in the laboratory and the environment is made possible by the fact that, in both cases, airflows must follow the same fundamental physical laws, stating that mass, momentum and energy are conserved. Techniques for achieving similarity between laboratory and full-scale conditions are well established in engineering practice (e.g. White 2015). A key component in these techniques is dimensional analysis, which ensures the relative importance of different effects is matched between experiments and the real world. This ability to rely on laboratory experiments and mathematical models is highly valuable, since data from a specific site can describe present airflow conditions, but present data alone may not be sufficient to predict how airflow will vary in response to topographical changes. In addition, it should be emphasized that the information being provided by the soaring community is valued and is indeed being considered, as I hope is attested by the discussion of Mr. Pagen's comments provided above.

It is also my understanding that the City retained Dudek to prepare the EIR, and I was invited to the team to prepare an objective analysis of wind flow affects associated with the proposed topographic modification, on the basis that the person conducting the analysis should not be involved in the proposed project, and should not be negatively or beneficially affected by the project outcome, since one of the cornerstones of CEQA is that studies should be objective and impartial. Consequently, the local soaring community has provided detailed comments on the air flow analysis, which I understand are also being considered by decision-makers, as intended under CEQA.

Exhibit 3: TKM Engineering Memorandum dated February 17, 2022

Rincon Trail Project Appeal
19-2015-CUP/CDP
City Council Hearing, March 28, 2022

MEMORAMDUM

TKM ENGINEERING

DATE: February 17, 2022

TO: John Ilasin, Public Works Director/City Engineer
City of Carpinteria

FROM: Thomas Mericle, Principal
TKM Engineering

SUBJECT: Evaluation of Rincon Multi-Use Trail 65% Design

In February 2021 I reviewed the Rincon Multi-Use Trail Project 65% preliminary design plans and provided comments to the City while working for Interwest Consulting Group. At the time, the City asked for a review of the 65% preliminary plans with regards to potential conflicts between the two trail terminus points and adjacent roadway or parking areas. I specifically reviewed sheets 8, 10, 20, 21, 37, and 39 that show the preliminary layout, signage, and delineation. The cover sheet and sheets indicated above are attached for reference.

I re-reviewed my comments and plans, and comments are summarized as follows:

1. The signage and striping details between shown on the detail sheet and delineation plan such as striping and stop legends are not consistent; one sheet shows some and the other shows something else. All signing and striping to be installed by the contractor need to be on one "signing and delineation" plan sheet so the contractor has installation notes, and it is clear what they are bidding on and installing.

2. In general, terminating a mixed-use trail either onto a public street or into a public park parking can be appropriate due to the slower-speed-mixed-vehicle environment. In this location, it is certainly preferable to putting bike traffic on the freeway and provides a connection to the trail facility south of this location. Many public (State and County) parks along Hwy 101 in the Santa Barbara-Ventura area have these types of interaction as the Pacific Coast Trail intersects public parking lots and public streets. A key to making the interaction between motor vehicles, bicycles, and pedestrians as safe as possible is making sure the terminus points have appropriate signing and striping. As the design moves into the final detailed design phases, City review will include making sure that the

designs meet CA MUTCD compliance and use best practices for signing and striping of this type of facility and mixed mode space. I recommend the following be considered by the design engineer when they prepare the next submittal:

a. Install a 4' edge line around the cul-de-sac to help deter movement onto the trail by vehicles.
b. Install a flexible delineator in the middle of the trail access points to deter vehicle access.
c. Use R5-3 sign instead of R53 sign shown on sheets 37 and 39.
d. Install signs reminding drivers that the parking lot is being used by walkers and bike riders and is a shared space.
e. Install guide signs that indicate where the trail goes or what the name of the trail is for improved user experience. Placement of these signs at the entrance to the parking lot where the trail is accessed from would be helpful for out-of-town tourists.

3. The location of the terminus at Carpinteria Ave may want to be moved. Because the trail comes out near the intersection with Hwy 150, there is no place for trail users to park and get directly to the trail. Consider moving the terminus of the trail so that it connects to the parking areas where people can access the trail directly. This is especially beneficial for kids.

In addition to my review of the 60% plans, the City has received comments that have expressed the following concerns:

1. The introduction of additional cyclists and pedestrians to the parking lot will increase the likelihood of incidents with vehicles using the parking lot, particularly on weekends when both the parking lot and trail may be at their highest use.

   Response:
   Parking lots at public beach areas by their nature are low-speed environments where there is a mix of users driving, walking, and biking. This configuration is similar to the bike path along Shoreline Drive in Santa Barbara that connects directly with the Ledbetter Beach Parking lot. In a conversation with the City of Santa Barbara they indicated that they have not experience any safety issues with this design and it was a better choice than putting the bike riders on the street with higher speed vehicles.

   The layout and dimensions of the parking lot at the top near the improved trail entrance and exit provides 20-feet for 90-degree parking on one side and a 28-foot aisle for mixed users. The 28-feet is more than the minimum aisle width standards (25-feet for 90-degree parking) for parking lots. This additional space increases opportunity for maneuverability to reduce negative interaction.

2. The downhill approach to the parking lot and the downhill slope through the parking lot have the potential to increase speeds of bikes into and through the parking lot.

   Response:
   The multi-use trail approach to the trailhead at the parking lot is a 2.3% slope down for about 165-feet followed by a 1% slope up for about 185-feet for a total of approximately 350-feet ending at the trailhead. This distance includes a 100-foot vertical curve transition between the two grades (see layout sheet 10). This relatively flat grade approach will not significantly change the speed of a bicycle as the rider approaches the trailhead. In addition, the trailhead itself does not provide direct connection to the parking lot area but connects through a trail Y and then into a cul-de-sac. Both these features coupled with signage and striping will reduce speeds of bikes before they enter the parking lot area.

   The remainder of the parking lot area is not a concern because bikes that come off the trail have already integrated into the mixed mode environment. In addition, the increased presence of people walking and biking in the entire parking lot will be a more frequent reminder to motorists that it is a mixed mode environment, and they should pay attention. This has been the case with the implementation of facilities elsewhere that have increased walking and biking activities.

COUNCIL AGENDA STAFF REPORT
MARCH 28, 2022

ITEM FOR COUNCIL CONSIDERATION

Review of the Mid-Year Budget Report and making related adjustments to appropriations.

STAFF RECOMMENDATION

Accept the Mid-Year Budget Report and approve adjustments to the budget as summarized in Attachment D.

Motion: I move to accept the Mid-Year Budget Report and approve amendments to the adopted budget as provided for in Attachment D.

Requires a roll call vote.

BACKGROUND

Each fiscal year the City conducts a Mid-Year review of the budget in order to examine financial results and trends as they compare to budget projections. This report compares Mid-Year results of the current budget year to the full year revenue and expenditure estimates in order to identify corrections or adjustments that may be necessary. The year-to-date actuals reviewed to project to the end of the fiscal year is the last month closed (July to February 2022).

This report also reviews the condition of significant revenue and expenditure categories and other important conditions known or anticipated at this time that are expected to impact the budget. In this context, the mid-year budget also informs early staff work being done for the next fiscal year's Budget.

The Mid-Year results indicate that the City's budget projections within each fund were generally sound. The primary interest is the General Fund, which is the funding source for a majority of the City's basic services, such as law enforcement and legal services. The adopted 2021/22 budget projected General Fund revenues excess of expenditures

by $480,955, Transfer in $8,600 (ARPA funding), and ($506,555) in subsidies to the Park Maintenance, ROW Assessment District and Recreation Services Fund. To fully support and fund the programs in the subsidy funds, Measure X also contributed $160,000.

Attachments A, B and C shows the Governmental Funds Revenues, Expenditures, and Transfer In/Out with the proposed increase/ (decrease). The columns represent total activity for FY's 2019/20 and 2020/21, Current Budget 2021/22 Year to Date (YTD) as of February 2022, Current Budget 2021/22, and Proposed Mid-Year 2021/22. In addition, the attachment shows the variance and percentage change between Current Budget 2021/22 and Mid-Year 2021/22.

Attachment D – Proposed Mid-Year 2021/22 Fiscal Review, Summary by Fund. The first table is the summary of funds for the current budget, second table is the proposed mid-year summary and the third table are the proposed changes to the current budget.

Overall, the recommended adjustments for all funds proposed an increase to revenue of $4,141,400, increase to expenditures of $101,025 and decrease to General Fund Subsidy of $128,211. In addition, the Annual Comprehensive Financial Report (ACFR) for June 30, 2021 reported the General Fund Available Fund Balance (AFB) of $1,423,234 compared to the Current Budget AFB of $1,767,681, therefore a decrease by $344,447.

The proposed appropriations for General Fund are expected to show expenditures and other fund subsidies in excess of revenues. The American Rescue Plan Act (ARPA) COVID-19 pandemic response expenses and revenue loss reimbursement resulted in an estimated operational excess of $2,317,497, which is $2,346,054 favorable to the current budget.

The City Council Finance / Budget Committee meets monthly and reviewed the Mid-Year Budget Report, including recommended adjustments, at its most recent meeting of March 22, 2022.

DISCUSSION

General Fund AFB balance increase $2,346,054 and Subsidy decrease $128,111

Proposed decrease to revenues of $194,500 include; $600,000 in Transient Occupancy Tax, $180,800 Charges in Services, $164,000 Sales Tax, $23,000 Licenses & Permits, and offset by decrease of $1,218,000 in Intergovernmental Grants and $10,000 Franchise Fees.

Proposed increase to expenditures of $164,530 include; $139,750 in Professional Services, $18,475 to Other Operating Expenses, $5,670 in Utilities, and offset by decrease of $60,000 in non-Operating and $15,000 in Capital Outlay.

Proposed decrease to operating transfers of $128,111 is due to ARPA revenue loss reimbursement to all funds that includes the subsidized funds.

Proposed decrease to subsidies includes: $16,641 Park Maintenance Fund, offset by decrease of $122,774 Recreation Services and $22,078 in ROW Assessment District Fund. Primarily due to ARPA reimbursement.

The ending AFB, $3,148,868 is $2,346,054 more than the budget.

General – Special Projects Reserve Fund decrease $27,391

Proposed increase to expenditures is the Linden to Holly Trail and Concha Park projects. This expenditure requires a subsidy from General Fund of $50,459 to complete the project.

The ending fund balance, $0 is $27,391 less than budgeted.

General – Major Asset Replacement decrease $44,000

Proposed increase to expenditures is for vehicle replacement for Community Development Code Enforcement Division.

The ending fund balance, $393,073 is $44,000 less than budget.

Measure X Fund balance increase $710,450

Proposed increase to revenue of $522,000 in Sales Tax (Measure X Local Sales Tax).

Proposed decrease to expenditure of $11,900 includes: $30,450 in Personnel Services offset by a decrease of $18,850 in Professional Services and $24,000 in Capital Outlay.

Proposed decrease to operating transfers of $167,550 primarily due to ARPA reimbursement.

The ending fund balance, $3,201,776 is $710,450 more than budget.

American Rescue Plan Act increase $3,212,000

Proposed increase to revenue of $3,212,000 includes ARPA revenue reimbursements and Interest Revenue.

Proposed decrease to operating transfers of 3,212,000 is to reimburse the operating expenditures of all funds going back to the start of the pandemic in March 2020.

The ending fund balance, $0 is $8,600 more than budget.

Recreation Services Fund balance decrease $25,219

Proposed decrease to charges for services revenue of $950.

Proposed increase to expenditures of $68,795 includes: $33,250 in Contract Services, $13,550 in Professional Services, $12,000 in Capital Outlay, $6,850 in Utilities, and $3,400 in Other Operating Expenses.

Proposed decrease to subsidies of $122,774 funded by General Fund primarily due to ARPA reimbursement. This fund operates the community pool, veteran's hall, and ocean beach services.

Capital Improvement Projects Fund balance increase $540,300

Proposed increase to revenue of $540,330 includes: $500,000 Intergovernmental and $40,300 Charges for Services.

The ending fund balance of $1,618,663 is $540,300 less than budget.

COVID-19 Update

The impacts of the Coronavirus (COVID-19) are winding down and now beginning to see revenue recovery in current fiscal year. The Finance/Budget Committee meets monthly on the fourth Thursday to discuss the prior months financial reports. The committee stays informed of any immediate impacts that may occur. These impacts come in three areas: Increased expenses, decreased revenues, and deferred revenues.

Two of the City's top General Fund revenue sources, sales and hotel bed tax, continue to recover and trending better than originally projected during the budget process. Sales Tax (Bradley-Burns 1%) projecting an increase to revenue of $164,000 for a total of $2,000,000 ($1,9000,000 FY 2018) and Transient Tax increase of $600,000 a total of $2,900,000 ($2,500,000 FY 2017). The is also an increase to Measure X revenue of $522 thousand for a total projection in current fiscal year of $3,7000,000. Expenditures are generally tracking per budget with slight increase ($76,000) than originally projected during the budget process.

The City received the first tranche of the American Rescue Act Plan (ARPA) recovery funds on July 2021 and is expecting the second tranche July 2022. These funds were intended for the City's revenue loss and additional expenditures, which exceed the ARPA allocation, in response to the pandemic beginning March 2020 (and that continued through the current fiscal year).

POLICY CONSISTENCY

Making adjustments to the budget during the fiscal year is consistent with the City's fiscal and budgeting policies

FINANCIAL CONSIDERATIONS

Amending the budget at Mid-Year is a procedural matter conducted annually to, in part, ensure adequate funds for projects, programs and services, and to more accurately project year end results.

LEGAL

No legal analysis is provided as a part of this report.

OPTIONS

The City Council may direct staff to modify any or all individual budget line items.

City of Carpinteria

COUNCIL AGENDA STAFF REPORT
March 28, 2022

ITEM FOR COUNCIL CONSIDERATION

Response to the 2021 Santa Barbara County Grand Jury report, "The Keys To Housing The Homeless, Two State Programs Offer Rooms and Homes".

STAFF RECOMMENDATION

Approve the letter response to the subject Santa Barbara Grand Jury Report.

Sample Motion: I move to approve the letter response to the Grand Jury Report for the City Manager's signature and transmittal.

BACKGROUND

The 2021 Grand Jury Report on initiatives to house the homeless in Santa Barbara County (Attachment A) was issued in November of 2021. The City's response was due in February and is past due.

The Report is in the standard Grand Jury format and includes four Findings and Recommendations. The Report is directed for response to the nine local government agencies in Santa Barbara County: the cities of Buellton, Carpinteria, Goleta, Guadalupe, Santa Barbara, Santa Maria, Solvang, and the County of Santa Barbara.

The purpose of this agenda matter is to provide a draft letter response to the Grand Jury Report for City Council consideration and action.

DISCUSSION

The City is required to respond to Grand Jury Findings in one of three ways: Agree, Disagree wholly or Disagree partially with an explanation. The City is required to respond to Grand Jury Recommendations in one of the following ways:

- Has been implemented, with brief summary of implementation actions taken

- Will be implemented, with an implementation schedule
- Requires further analysis, with analysis completion date of no more than six months after the publication of the report
- Will not be implemented, with an explanation of why

That attached draft letter has been prepared to reflect this format for the City Council's consideration.

POLICY CONSISTENCY

Responses to Grand Jury inquiries, findings and recommendations, are consistent with the City's interest in transparency and effective communication with the public about local government issues. Collaborating in the regional response to homelessness is consistent with the City's Housing Element and its interest in addressing community service needs.

FINANCIAL CONSIDERATIONS

This response to the Grand Jury report does not directly involve any financial considerations.

LEGAL AND RISK MANAGEMENT CONSIDERATIONS

The City is required by law, California Penal Code §933(c), to provide comments in response to the Grand Jury Report within 90 days of the date of receipt.

PRINCIPAL PARTIES EXPECTED AT MEETING

None

THE KEYS TO HOUSING THE HOMELESS

Two State Programs Offer Rooms and Homes

SUMMARY

In 2020, the State of California (State) proposed two programs to help communities manage their homeless populations: Project Roomkey and Project Homekey. Both programs were also an urgent response to the COVID-19 pandemic to prevent disastrous effects on the homeless. Roomkey secured short-term hotel rooms for chronically ill elderly homeless who were at risk of catching and spreading the virus. Homekey was intended to house some of that same population through conversion of available buildings to permanent housing. The State offered one-time funding for the communities able to meet specific time sensitive requirements. Santa Barbara County (County) took advantage of the State's offers to provide temporary and permanent housing to some of the County's homeless.

The 2021 Santa Barbara County Grand Jury (Jury) studied the two new Projects as they were implemented in Santa Barbara County. The Roomkey funding ended September 30, 2021; the Homekey funding allocation ended December 31, 2020. These time constraints motivated Santa Barbara County agencies to work together quickly to accomplish the housing goals.

The County has found it difficult to duplicate its successes with Projects Roomkey and Homekey. There is a discouraging lack of available property in the County, and property owners are reluctant to turn over what they have for the purpose of housing the homeless. Nor are there identified local funds to sustain the two programs without additional State and Federal grant allocations. The 2021 Santa Barbara County Grand Jury looked into the barriers that limit the success of the two homeless programs.

INTRODUCTION

The COVID-19 virus increased the need for homeless services, highlighting the dire conditions for a subset of the unhoused population who were especially at risk of contracting the virus – the elderly and those with underlying medical conditions. In the spring of 2020, hospitals were filling up at a time when people were exposed to the virus. At the same time, homeless shelters were required to implement social distancing, which forced them to reduce their population (at one shelter by more than 60 percent and at another by 13 percent) because of COVID and send some individuals back into the streets. The County needed to determine the best way to protect the homeless.

Confronting this challenge, the State of California initiated a plan with generous funding for the counties struggling with how to protect the homeless from the virus. Using Federal Emergency Management Agency (FEMA) and Coronavirus Aid, Relief, and Economic Security Act (CARES) funding, the State offered two programs, Project Roomkey and Project Homekey, to stimulate community participation in these innovative housing programs for the homeless.

In April 2020, Governor Newsom announced Project Roomkey, which would get people experiencing homelessness and at risk of getting COVID into participating hotels or motels on an emergency basis. Roomkey was intended to open underused hotel or motel rooms for the

homeless who needed to isolate or quarantine from exposure to COVID-19. The State's goal was to find up to 15,000 rooms to temporarily shelter these homeless in supervised programs with case management. Jurisdictions who participated also agreed to then re-house them into permanent housing, supported by services.

As a first response to the pandemic, Roomkey was considered an interim response to a public health crisis that had already strained the health care system. The original program termination date was June 30, 2021; it was later extended to September 30, 2021. Statewide, a total of $150 million was dedicated to the initial Project Roomkey in June 2020. The Governor added another $62 million in November 2020 in order to avoid evictions of those homeless in rooms when the program was set to end in December 2020.

Project Homekey was intended to be the next step in the longer term crisis of homelessness by converting hotels and other similar buildings to permanent housing. On June 30, 2020, the State introduced Homekey for homeless housing using $600 million of coronavirus relief funds for the program statewide, and $300 million to help efforts to reduce homelessness. Similar to Roomkey, Homekey was conceived as a State partnership with cities and counties applying for grants, this time to purchase hotels, motels and other appropriate but underused buildings for conversion. The rehabilitated units would provide permanent housing for the homeless. By the end of 2020, more than $846 million had been awarded to 48 jurisdictions for 94 projects across the State.

In the process of tackling homeless vulnerability during the pandemic, Santa Barbara County and its cities made promising steps to address homelessness with the one-time State funding. The County leased rooms in a hotel in South County for Project Roomkey for a limited time and converted an office building in North County for permanent housing using Project Homekey funding. A great deal of collaboration among County agencies went into the accomplishment of these two projects, establishing important groundwork for any future homeless projects. Yet even with outside funding either ending or being time-restricted, the long-term future of Projects Roomkey and Homekey, including property acquisition and conversion, in Santa Barbara County is uncertain.

METHODOLOGY

The 2021 Santa Barbara County Grand Jury interviewed representatives from homeless assistance programs across the County, Santa Barbara County Housing and Community Development Division, and the City of Santa Barbara Community Development Department. The Jury also interviewed representatives from the Santa Barbara County Public Health and Santa Barbara County Behavioral Wellness Departments, as well as the Santa Barbara City and County Housing Authorities. The Jury met with an affordable housing contractor, a homeless shelter case manager, and a homeless shelter executive director. Additionally, numerous news articles, local city and County agenda letters, and State public information posts were reviewed.

OBSERVATIONS

Project Roomkey

In February 2020, the Santa Barbara County Housing and Community Development Division reported a total of 1,897 homeless county wide, of which 1,223 were unsheltered, 674 in emergency shelters or transitional housing. One month later, the Board of Supervisors declared a local emergency for the pandemic. County officials quickly formed a COVID-19 Homeless Task Force Response Team and devised emergency solutions to strategic problems hitting the homeless population. With shelters needing to minimize occupancy and various agencies closing down, the homeless lost access to beds and to such services as showers and meals. The Santa Barbara County Task Force devised alternative sites for beds and services. One first step was the opening of the gym at Santa Maria High School; it was converted to a shelter for 71 homeless individuals for two months. Concurrently, the Public Health Department began by securing a limited number of rooms as emergency shelters in hotels in North and South County in order to protect those at risk of contracting COVID-19.

The Task Force also initiated steps that led to participation with the State in Project Roomkey. By the end of April 2020, the County was able to open rooms at a hotel in South County. The City of Santa Barbara and People Assisting the Homeless (PATH) helped organize this novel response to the pandemic. Roomkey in the County began with 40 homeless individuals. In Santa Barbara County, county officials prioritized individuals over age 65 with a serious health condition, then those under 65 with a serious health condition, and lastly those over 65. The age qualification was later lowered to 55. FEMA later made these criteria for Roomkey housing official for all the chronically homeless in the State.

Santa Barbara County Public Health did a medical review to establish adherence to Center for Disease Control guidelines for those who were invited to join the program. The homeless came from the hospital emergency rooms and shelters, but mostly from the streets. Originally, they were invited to stay 90 days, but extensions were allowed. At its peak, there were 70 occupants participating in Project Roomkey. By October 2021, the Project had sheltered over 190 individuals.

While not all seniors with chronic illnesses chose to take advantage of the Roomkey housing continuum due to program restrictions (curfew, and no noise, smoking, visitors, alcohol, or drugs, etc.), the Jury learned the target population is more likely to move into a hotel room rather than into congregate shelters.

Locally, it was difficult to find hotels to participate in Project Roomkey. Hotel owners were hesitant to house a high-risk population. The County was unable to find a willing participant in North County, and only one hotel in South County agreed to rent one wing for a limited period of time. Even the drop in hotel occupancy during the pandemic was not enough to entice hotel owners to turn over their rooms to a county-run program for the homeless. The original Roomkey hotel returned to tourism at the beginning of 2021. Fortunately, the County was able to lease another hotel in South County with rooms for 80 individuals and rent as many as ten hotel rooms in Santa Maria.

One intention of the Roomkey program was to house individuals until they could transition into permanent housing, a process estimated to take 90 days. Successfully staying in a hotel room was considered a stepping-stone to independent living. By the end of September 2021, eighty-

eight individuals were able to make the transition. The most vulnerable were the first to be rehoused with services.[1] With the fortunate timing of units becoming available in newly opened apartment complexes with the Housing Authority of the City of Santa Barbara, nine formerly homeless moved into existing available units. Others "voluntarily or involuntarily exited" the program, according to the County. At the one-year mark, program administrators within the County reported to the Jury that 56 percent of Roomkey participants had left the streets and moved into housing. The rate dropped slightly by the program's end in September due to a lack of available units, reducing the ability to re-house clients.[2]

It has been estimated that the cost of housing one person in a hotel room with provided services is $180 per night. Services include security, staff, meals, transportation, and supplies. FEMA will reimburse the County only up to $90 per night, and the County must make up the difference. FEMA reimbursement is expected to end in December 2021. Behavioral Wellness and Public Health continue to provide wraparound services, which include case management and medical and mental health care. To date, the County has been able to tap into CARES funds and homeless program funds from the Department of Social Services to pay the extra room and service costs. With Roomkey, local hospitals, County, and municipal public services were spared some heavy recurring costs and services related to caring for this dependent population.

The first Project Roomkey in Santa Barbara County received more than $1 million in State funding. Project Roomkey is dependent on funding from the State and Federal government, and the program cannot continue unless the County identifies another revenue source. The 2021-22 California State budget is maintaining $150 million in funding for a modified Project Roomkey and Rehousing Strategy, with the intention of allowing residents of Roomkey to stay until they can find permanent housing. From that, Santa Barbara County will receive a baseline allocation of $772,384 for the work of transitioning the formerly homeless. That money will be used to re-house at least 40 of those remaining in the Roomkey motel.

Project Roomkey has been a model for other programs in the County. City Net in the City of Santa Barbara has been inviting homeless individuals to stay in 15 different motels located around the city for six months. City Net's program, known as the scattered model, is being considered for future hotel/motel leasing in the County because of its reduced impact on surrounding businesses and neighborhoods. City Net also established a temporary Roomkey-type program in Santa Barbara. After the Loma Fire within city limits in May 2021, the Santa Barbara City Council voted to pay for a program to shelter those living in encampments through the four-month fire season. Full-service motel rooms are expensive,[3] but the City of Santa Barbara felt it had to do something to reduce the threat of fires from homeless encampments in fire-prone areas.

Roomkey has served as a stimulus for thinking creatively about homeless issues and for opening doors to homeless housing. Overall, Project Roomkey motivated the County to find a quick and easily accomplished solution for the most vulnerable homeless at a critical time.

---

[1] This follows the National Alliance to End Homelessness, Housing First protocol of housing the most vulnerable first.

[2] The Housing Authorities of Santa Barbara County and the City of Santa Barbara have several affordable housing projects in progress now. Each development includes some units for formerly homeless clients. There should be a greater movement through the housing continuum again once the Housing Authority units are available, which will increase the re-housing rate percentage again.

[3] The daily cost of the room was estimated at $109/day, plus $157/day for services. (Nick Welsh. "Upper State Street Motel May Rent All Rooms to Homeless." *Santa Barbara Independent*. June 26, 2021.)

Project Homekey

Project Homekey is California's evolutionary next step after Project Roomkey. The State hoped that some of the Roomkey hotels would become part of Homekey's permanent housing program. While none of the hotels were willing to sell to the County, the Housing Authority of the County of Santa Barbara (HASBARCO) applied for and received one grant award of $3.12 million to acquire an office building in Lompoc and repurpose it to permanent housing with supportive services for its residents. The County added $1.5 million. The building had originally been an apartment building and then was converted to an office building used by the County's Behavioral Wellness Department. Some remodeling was needed to create apartments again.

The State not only challenged jurisdictions to find buildings to rehabilitate for the homeless, but it also imposed tight time restrictions in the application process. Project Homekey was announced June 30, 2020. Local governments had to identify properties, have remodeling plans, partners, and a proposal in place by August 13, five weeks after the announcement of funding. They then needed to purchase the properties, revitalize them, and, finally, occupy them by the end of the year. In Lompoc, 14 residents and one manager moved into their new homes just before and just after the deadline of December 31, 2020. All in all, this was a five-and-a-half-month process.

With news of the Homekey grant program, the director of HASBARCO called emergency meetings with the County and its agencies. The County assembled a task force from all involved agencies to break down bureaucratic walls and speed up the process.[4] One advantage that the County had was that the office building to be converted was already owned by the County. The Planning and Development Department was able to self-permit and do its own inspections, and regulations such as land use, zoning, and building codes could be streamlined. HASBARCO engaged a developer who was familiar with the most efficient ways to get things done and who worked up to seven days a week. The City of Lompoc contributed to the teamwork. The State also cooperated in easing certain deadlines, understanding the imposition of the short timeline. Construction projects in this County typically take three to four years. The spirit of collaboration moved this project forward in less than six months, an unparalleled accomplishment in recent Santa Barbara County building history.

The Homekey Project is meant to be an economical way to house the homeless. State officials have estimated that the state average for the cost of purchase and rehabilitation of existing buildings in Project Homekey came to $147,974 per unit (including an average local match of $23,987), while the cost of building from the ground up comes to $400,000 per unit.[5] In an expensive county such as Santa Barbara, the Jury was told the per unit cost is considered to be around $200,000-$250,000 to convert and a minimum of $450,000 per unit to build from the ground up.

Clients moving in to the Homekey units were vetted by the County's Coordinated Entry System (CES), which assesses clients and matches them with services. Still being a time of a pandemic, clients were selected with the first criteria of protecting them from COVID-19. They also had to

---

[4] Expediency minimizes costs during construction. That way, more money can be spent on the purchase of buildings.

[5] Office of Governor Gavin Newsom. "Governor Newsom Announces Major Homekey Milestone: All 94 Sites Closing Escrow Ahead of Deadline." December 29, 2020. In another estimate made on April 5, 2021, Lou Hirsh of *Co-Star News* quoted the conversion estimate to be $138,513, and the building average was $400,000 per unit.

be able to live responsibly and independently. Homeless officials have told the Jury that many homeless no longer want to live in a congregate setting; they want their own space, and this often helps their stability. All supportive housing includes services (e.g., health care, mental health, and case management), which are considered essential for their success in independent living.

As permanent residents, the clients have to pay rent. Typically, the formerly homeless are issued a Section 8 voucher.[6] This Federal program allows clients to pay only 30 percent of their income (often Social Security or Disability Benefits) toward rent. The Federal government pays the rest. VA Supportive Housing (VASH) is available to take care of rent payments for veterans.

While the COVID-19 pandemic depressed hotel demand from tourism, no owners were willing to sell their properties for the purpose of being transformed to homeless housing. Acquiring hotels will only be more difficult when tourism is flourishing again. The Jury was told that local officials have "scoured the universe" looking for available properties that were willing to sell to the County, yet could find only one pre-owned possibility in North or South County for the Homekey project. In the end, the site selected for Homekey was offered by a County department, Behavioral Wellness.

For Project Homekey, there are local impediments inherent in buying hotels in local communities: limited available real estate, high property values, expensive rents, a steady and recovering tourism business for hotels, and neighborhood resistance. Often in planning housing for the homeless, there is a need for negotiations with neighborhoods. The Jury heard that the onset of the pandemic temporarily fostered a more tolerant view of housing the homeless. There were no protests against the Homekey project. HASBARCO's goal is to be a good neighbor. In addition to hosting neighborhood forums, both Housing Authorities address community concerns in all its housing projects. Their housing developments are landscaped, maintained well, and have onsite supervision for the security of neighbors, as well as its clients. Moreover, the Department of Behavioral Wellness provides case management services for every resident.

The County hopes to create Memorandums of Understanding (MOUs) with cities, which could consolidate funding and foster regional cooperation. Santa Barbara City and County Housing Authorities have worked with corporations and banks to gain their investment in community housing, mostly through tax credits. Local leaders have approached church organizations and school districts for support. More housing alliances could be forged with hospitals and service organizations to apply for Homekey funds, for example. County departments such as Behavioral Wellness, Public Health, and Social Services could band together to apply for funding for projects. While these concepts can help, funding for housing for the homeless continues to be dependent upon State and Federal money.

Homekey funding comes at a time when the State is contributing extraordinary amounts of money to solve homelessness. The 2021-22 State budget earmarked $1.45 billion for Homekey, Round 2, and an additional $1.3 billion the following year. The State is allowing more flexibility in the criteria in the types of buildings to convert and the amount of time to convert them. Jurisdictions have between the end of September 2021 and the beginning of May 2022 (or until all funds are exhausted) to submit an application. Once funding is awarded, jurisdictions have eight months to expend the funding and 12 months to complete construction. The building must

[6] The County estimates 80% of those transitioning into permanent housing require a subsidy. The County's Phase II Community Action Plan to Address Homelessness calculated a need for a total of 531 long-term subsidies and 835 permanent supportive housing units for the County.

be fully occupied within 90 days after completion. However, there is no guarantee of receiving an award from the State. Santa Barbara County must apply and compete with other California counties and jurisdictions for these limited-time funds.

As of September 2021, no sites had been identified for homeless projects. There is no line item in the budget for acquisition of property to house the homeless at the County level or within city jurisdictions. To qualify for more state Homekey funding, the County must be ready with a site, partners, and its own complementary funding.[7] Given the temporary nature of the State funding, agencies need to apply the lessons from the first Homekey success in terms of quick acquisition of a site, ready funding, and inter-departmental cooperation. The County has created a "strike team," but other jurisdictions could also help prepare plans to take advantage of funding opportunities. Identifying possible sites and opening negotiations with the owners ahead of funding announcements remains a critical component to success. Above all, to secure the legacy of the Homekey program, the County and its cities and agencies need to work together to put plans in place.

CONCLUSION

The confluence of a pandemic and a State budget surplus created an exceptional opportunity for those that work with the homeless population. The cost and magnitude of the homeless issues must be addressed with the cooperation of the Federal, State, and local governments. For 2021-22, there is $150 million in State funding available for Roomkey and $1.45 billion for Homekey. The County and cities would not be able to consider leasing or purchasing buildings for these homeless programs and providing services without this funding.

The 2021 Santa Barbara County Grand Jury concluded that the County, cities, and Housing Authorities would do well to make every effort to secure more housing for the homeless at this time when State and Federal money is available. Incentives that the County offers community partners now could produce more positive outcomes than at any other time. In the long run, extra funds spent on homeless housing now can reduce the millions of dollars being absorbed as collateral homeless expenses by county or city agencies such as fire, police, ambulance, public and environmental health, hospitals, jails, parks, libraries, mental health clinics, public works, street maintenance, and more. In the future, savings from these respective departments could be combined for homeless projects.

While Roomkey and Homekey have only helped a fraction of the total homeless in the County, the two projects have set a precedent and illuminated the way for similar projects to house the homeless. County agencies can work together to accomplish rapid results. It took a global emergency to bring community partners to the table with a true sense of collaboration. Now that those alliances are established, these agencies can more effectively coordinate the work to purchase and convert buildings for formerly homeless residents. Santa Barbara County and its cities must continue to work together and devise incentives and methods of funding to further the successes of Projects Roomkey and Homekey.

---

[7] In the meantime, County, state, and Federal funds are being allocated to other forms of homeless housing: $1,935,000 over three years for an encampment response program, and $4,935,560 over three years for a new shelter, pallet homes, and a tiny home project. The County hopes to add 100 available beds with these three programs. It also hopes that Project Homekey will add the same number of beds for the homeless. Only the first year is considered for funding now. Without state funding and Federal grants, these programs would have to be curtailed also.

FINDINGS AND RECOMMENDATIONS

Finding 1

During the COVID-19 pandemic Project Roomkey demonstrated the value of providing rooms, with appropriate services, for the vulnerable elderly homeless with underlying health conditions.

Recommendation 1

That the Santa Barbara County Board of Supervisors and all city councils within the County establish programs similar to Roomkey in both North and South County to continue to provide rooms, with appropriate services, for vulnerable elderly homeless with underlying health conditions.

Finding 2

Few hotels and motels throughout Santa Barbara County were willing to participate in Project Roomkey.

Recommendation 2

That the Santa Barbara County Board of Supervisors instruct the Santa Barbara County Community Services Department to form an alliance with all city councils within the County to develop a roster of hotels and motels willing to participate in a Roomkey-type program.

Finding 3

Buildings for Homekey conversion have been difficult to locate and acquire.

Recommendation 3

That the Santa Barbara County Board of Supervisors and all city councils within the County identify possible Homekey sites including government owned properties in each jurisdiction.

Finding 4

Project Homekey called upon various Santa Barbara County departments to work together creatively, quickly, and economically to transform a County owned office building into housing for the homeless.

Recommendation 4

That the Santa Barbara County Board of Supervisors instruct the Santa Barbara County Community Services Department to solidify a team to replicate the successful efforts in converting buildings efficiently into housing for the homeless.

Finding 5

Both Project Roomkey and Project Homekey are reliant on short-term or one-time funding from the State and Federal governments.

Recommendation 5

That the Santa Barbara County Board of Supervisors and all city councils within the County develop and implement a plan for funding Roomkey and Homekey-type programs.

Finding 6

The Roomkey and Homekey programs require funding to provide wraparound services for the homeless.

Recommendation 6

That the Santa Barbara County Board of Supervisors direct the Santa Barbara County Public Health, Behavioral Wellness, and Social Services Departments, along with the Santa Barbara County Community Services Department, to explore options for funding for wraparound services.

REQUEST FOR RESPONSE

Pursuant to *California Penal Code Section 933 and 933.05*, the Santa Barbara County Grand Jury requests each entity or individual named below to respond to the enumerated findings and recommendations within the specified statutory time limit:

Responses to Findings shall be either:

- Agree
- Disagree wholly
- Disagree partially with an explanation

Responses to Recommendations shall be one of the following:

- Has been implemented, with brief summary of implementation actions taken
- Will be implemented, with an implementation schedule
- Requires further analysis, with analysis completion date of no more than six months after the issuance of the report
- Will not be implemented, with an explanation of why

Santa Barbara County Board of Supervisors – 90 Days

Findings 1, 2, 3, 4, 5, 6

Recommendation 1, 2, 3, 4, 5, 6

City of Buellton – 90 Days

Findings 1, 2, 3, 5

Recommendation 1, 2, 3, 5

City of Carpinteria – 90 Days

Findings 1, 2, 3, 5

Recommendation 1, 2, 3, 5

City of Goleta – 90 Days

Findings 1, 2, 3, 5

Recommendation 1, 2, 3, 5

City of Guadalupe – 90 Days

Findings 1, 2, 3, 5

Recommendation 1, 2, 3, 5

City of Lompoc – 90 Days

Findings 1, 2, 3, 5

Recommendation 1, 2, 3, 5

City of Santa Barbara – 90 Days

Findings 1, 2, 3, 5

Recommendation 1, 2, 3, 5

City of Santa Maria – 90 Days

Findings 1, 2, 3, 5

ATTACHMENT B

CITY of CARPINTERIA, CALIFORNIA

March 28, 2022

Santa Barbara County Grand Jury
Presiding Judge Gustavo Lavayen
312 East Cook Street
Santa Maria, CA 93454

RE: City of Carpinteria's Response to the Findings and Recommendations in the Santa Barbara County Grand Jury Report on "The Keys To Housing The Homeless, Two Stat Programs Offer Rooms and Homes"

To Presiding Judge Gustavo Lavayen,

I am writing in response to the Grand Jury report entitled, "The Keys To Housing The Homeless, Two Stat Programs Offer Rooms and Homes."

The City of Carpinteria City Council considered the Report at its regular meeting of March 28, 2022, and the proceedings can be viewed through the City's website at www.carpinteria.ca.us. The City Council authorized the following responses to the request from the Grand Jury for responses to certain findings and recommendations of the Report:

Finding 1: During the COVID-19 pandemic Project Roomkey demonstrated the value of providing rooms, with appropriate services, for the vulnerable elderly homeless with underlying health conditions.

City of Carpinteria Response to Finding 1: Agree

Recommendation 1: That the Santa Barbara County Board of Supervisors and all city councils within the County establish programs similar to Roomkey in both North and South County to continue to provide rooms, with appropriate services, for vulnerable elderly homeless with underlying health conditions.

City of Carpinteria Response to Recommendation 1: Will not be implemented.

As a small city, Carpinteria collaborates with the County and other service providers in order to deliver various health and human services, including homeless services, to the Carpinteria community. Developing an independent City funded, managed and operated program that emulates the Homekey and Roomkey programs funded by one-time state monies, is neither financially feasible nor practicable.

The City of Carpinteria is receptive to expanding its collaboration with the County and service providers such as CityNet in order to establish short-term, transitional housing with supportive

services for people experiencing homelessness in Carpinteria. The City currently provides funding for a limited number of motel stays annually and relies on recommendations for use of the limited funds from the homeless service providers network serving Carpinteria.

City of Carpinteria Response to Recommendation 1: Will be implemented

The City evaluates its pension obligations along with other critical financial information as a part of its Long-Term Financial Plan. The Long-Term Financial Plan is currently being updated and is expected to be considered for approval by the City Council prior to June 30, 2022.

Finding 2: Few hotels and motels throughout Santa Barbara County were willing to participate in Project Roomkey.

City of Carpinteria Response to Finding 2: Agree (as to Carpinteria only)

Recommendation 2: That the Santa Barbara County Board of Supervisors instruct the Santa Barbara County Community Services Department to form an alliance with all city councils within the County to develop a roster of hotels and motels willing to participate in a Roomkey-type program.

City of Carpinteria Response to Recommendation 2: Has been implemented

The County has worked with Carpinteria to collect information about potential motel acquisitions.

Finding 3: Buildings for Homekey conversion have been difficult to locate and acquire.

City of Carpinteria Response to Finding 3: Agree

Recommendation 3: That the Santa Barbara County Board of Supervisors and all city councils within the County identify possible Homekey sites including government owned properties in each jurisdiction.

City of Carpinteria Response to Recommendation 3: Has been implemented

One of the outcomes of the above described inventory of potential sites in the County was the establishment of two projects: one in Isla Vista and the other in Lompoc. The City is open to future collaboration with the County to identify motels or other sites for establishment of housing to help address the needs of the local homeless population.

Finding 5: Both Project Roomkey and Project Homekey are reliant on short-term or one-time funding from the State and Federal governments.

City of Carpinteria Response to Finding 5: Agree

Recommendation No. 5: That the Santa Barbara County Board of Supervisors and all city councils within the County develop and implement a plan for funding Roomkey and Homekey-type programs.

City of Carpinteria Response to Recommendation 5: Will not be implemented.

This recommendation implies working independently to establish program funding for Roomkey and Homekey type programs. The City is open to working collaboratively to identify and develop appropriate funding with the County and other jurisdictions in the region. However, as described in the response to Recommendation 1, developing an independent City funded, managed and operated program that emulates the Homekey and Roomkey programs funded by one-time state monies, is neither financially feasible nor practicable.

Yours,

Dave Durflinger
City Manager

Cc: Carpinteria City Council
Steve Goggia, Community Development Director
